CHE'LTENHAM, a town, parliamentary borough, and fashionable watering-prace, in the county of Gloucester, eight miles north-east of Gloucester. It lies in a picturesque and healthy valley on the Chelt, a small stream which rises in the adjacent hills, and flows into the Severn. It is sheltered on the east and south-east by a semicircle of the Cotswolds. It owes its celebrity and rapid increase to its mineral springs, of which there are several varieties. The chief street is upwards of a mile long, right and left of which are spacious and elegant squares and crescents, and innumerable villas lately erected for the accommodation of the numerous visitors. Attached to the spas are handsome pump-rooms—with tasteful grounds, avenues, saloons—lodging-houses, and public promenades among the finest in England, besides many fine mansions in and around the town. It has ten churches and a number of dissenting chapels. Of late years, C. has become famous for its public schools, the oldest of which is its endowed grammar-school, capable of educating 300 scholars; but the largest, and now the most celebrated, is its Proprietory College, for the sons of gentlemen, a noble institution, educating, upon an average, 600 pupils. There are also a Ladies' College, a Junior Proprietary School, and a number of private scholastic establishments. There are public assembly-rooms in the town; which is also much resorted to in winter for its hunting. It has two clubs, and several weekly newspapers. Pop. (1871) 44,519; (1881) 46,844. C. returns one member to parliament, and it has been a municipal borough since 1876. It has no manufactures of any importance. C. was only a village in 1716, when the first spring was discovered. It gradually increased till 1788, when the benefit received by George III. from its waters suddenly made it a resort of fashion.

CHE'MIC is the name given to BLEACHING POWDER by those engaged in chemical works.

CHEMICAL NOMENCLA'TURE AND NOTA'TION. (During the progress of the *Encyclopædia*, the nomenclature and notation of chemistry were greatly changed.) In early times, chemical substances were named according to the fanciful theories of Alchemy (q. v.). Thus the name *flowers of sulphur* was applied to the sublimed sulphur, which grew or sprang like a flower from sulphur when heated; *spirit of salt*, to hydrochloric acid, the corrossive acid or spirit obtained from common salt; and a multitude of other names had a like fanciful origin. In 1787, Lavoisier founded the system of nomenclature which is followed still by chemists.

At first, it was intended that the names of simple as well as compound substances should be regulated by system. Hence such terms as oxygen (from *oxus*, acid, and *gennao*, to produce), *the acid-producer*, given from the notion then held that no acid was without oxygen; and hydrogen (from *hydor*, water, and *gennao*), *the water-producer*, from the supposition that hydrogen had more to do with the formation of water than any other element. The advance of chemistry, however, has so completely changed the opinion of chemists regarding the simpler bodies, that such names are now found to mislead; and thereafter, though such as had been given on this system were retained, their meaning has been discarded, and the systematized nomenclature restricted to compound substances. A remnant of the system, however, still subsists at the present time, in making the scientific names of all the metals end in *um*. In the non-metallic elements, a close analogy exists between chlorine, bromine, iodine, and fluorine; and to indicate this, the common termination *ine* has been given; and for a similar reason, carbon, silicon, and boron, end in *on*. As a general rule, however, the chemical name of an elementary substance does not convey any scientific meaning, and must be regarded as a simple mark or designation, analogous to the names of persons, which give no notion regarding their moral character or physical development. The ancient and more common metals retain their popular titles, such as gold, silver, and copper; but the more recently discovered metals have names given which end in *um*. The symbol of an element is obtained from the first letter of its Latin name, as O for oxygen; Pl for lead (Lat. *plumbum*). When the names of two or more elements commence with the same letter, a smaller letter or satellite is attached to one or more of these; such as S for sulphur, Se for selenium, and Si for silicon. For a complete table of the symbols of the elementary substances, see ATOMIC WEIGHTS.

The name of a compound substance generally indicates the elements of which it is composed. Thus the name oxide of iron indicates that the red powder (rust) is made up of oxygen and iron; the sulphuret of lead (galena), that it is composed of sulphur and lead. In all similar combinations—

Oxygen	forms	Oxides.
Chlorine	"	Chlorides.
Bromine	"	Bromides.
Iodine	"	Iodides.
Fluorine	"	Fluorides.
Nitrogen	"	Nitrides.
Carbon	"	Carbides or Carburets.
Sulphur	"	Sulphides or Sulphurets.
Selenium	"	Selenides or Seleniurets.
Phosphorus	"	Phosphides or Phosphurets.

When two elements combine with each other in more than one proportion or equivalent (see ATOMIC THEORY and ATOMIC WEIGHTS), the names of the compound bodies are contrived so as to express this. The term *prot*oxide is applied to a compound of one equivalent of oxygen with one equivalent of another element; *deut*oxide to a compound containing a larger proportion of oxygen than the protoxide; and *trit*oxide when the oxygen is still further increased. The term *bin*oxide is used when oxygen is present in the proportion of two equivalents to one equivalent of the other element; and *ter*oxide when the proportion is as three to one. A *sub*oxide contains less than one equivalent of oxygen; and a *per*-oxide is the highest oxide not possessing acid properties. The same prefixes are applied to the compounds of chlorine, sulphur, &c.

When one element combines with another to produce several compounds possessing acid properties, various terminations are employed to distinguish the compounds. Thus, oxygen combines with a number of the elements to produce with each a series of acid compounds, the more *highly* oxidized of which receive the termination *ic*, whilst those containing *less* oxygen end in *ous*. Thus, sulphur*ic* acid contains three equivalents of oxygen to one equivalent of sulphur; and sulphur*ous* acid, two equivalents of oxygen with one equivalent of sulphur. These terminations are qualified by the use of the prefixes *hypo* (under) and *hyper* (over). Thus *hypo*sulphur*ic* acid is applied to a compound containing less oxygen than the sulphur*ic* acid, and *hypo*sulphur*ous* to one with less oxygen than sulphur*ous* acid.

When acids combine with bases or metallic oxides to form salts, they produce compounds, the names of which are influenced by the terminations of the acids. Thus, sulphur*ic* acid and soda form the sulph*ate* of soda; sulphur*ous* acid and soda, the sulph*ite* of soda; and *hypo*sulphur*ous* acid and soda, the *hypo*sulph*ite* of soda. In the same manner, nitr*ic* acid with potash forms the nitr*ate* of potash, whilst nitr*ous* acid and potash produce the nitr*ite* of potash.

If a symbol be employed alone, it represents one equivalent of the element. Thus, O signifies one equivalent, or eight parts by weight, of oxygen; C, one equivalent, or six parts by weight, of carbon; H, one equivalent, or one part by weight, of hydrogen. The combination of two elements is represented by placing the symbols for those elements side by side; thus, HO signifies one equivalent of hydrogen and one equivalent of oxygen in a state of chemical combination (viz., water); and NaCl is one equivalent of sodium (Lat. *natron*) united with one equivalent of chlorine (viz., common salt).

When two or more equivalents of one element unite with one or more equivalents of another element, the number of such equivalents is signified by a small figure being placed immediately after the symbol of the element so multiplied. Thus, HO_2 represents one equivalent of hydrogen in combination with two equivalents of oxygen (peroxide of hydrogen); MnO_2 is one equivalent of manganese with two of oxygen (black oxide of manganese); Fe_2O_3 is two equivalents of iron with three equivalents of oxygen (rust); and Pb_3O_4 is three equivalents of lead with four equivalents of oxygen (red lead).

In expressing the formula of a compound substance, the symbol of the metal or its analogue is placed first in order, and is succeeded by the oxygen, chlorine, or similar element. Thus, the symbol for the chloride of mercury is always written HgCl, never ClHg. The same order is carried out in the construction of the formula of more complex substances; the metallic half is placed first. Thus, sulphate of iron—containing sulphuric acid and the oxide of iron—is always expressed as FeO,SO_3, never SO_3FeO. In other words, the symbols are written in the order in which the substances would be named in Latin.

In the construction of the formulas of complex substances, the comma (,) and *plus* sign (+) are often introduced; the former to separate the symbols of substances which are closely united together, and the latter to form a line of demarcation where the components are less intimately combined. Thus, FeO,SO_3+KO,SO_3 represents the compound of the sulphate of iron with the sulphate of potash; $KCl+PtCl_2$ is the double chloride of potassium and platinum.

Large figures placed at the left hand of a formula multiply all the symbols till a comma or plus sign appears. Thus, $3SO_3$ represents three equivalents of sulphuric acid; $3PbO,\overline{A}$ is three equivalents of oxide of lead, and one equivalent of acetic acid; and $KO,SO_3+Al_2O_3,3SO_3+24HO$ (alum) is one equivalent of the sulphate of potash, with one equivalent of the sulphate of alumina, and 24 equivalents of water. When a compound substance requires to be multiplied, it is enclosed within parentheses, and a large figure placed immediately before it; thus, $3(KO,C_2O_3)+Fe_2O_3,3C_2O_3+6HO$ represents three equivalents of oxalate of potash, one equivalent of oxalate of iron, and six equivalents of water.

In expressing the formulas of organic compounds, the symbols are written in the following order: CHNO. Thus, turpentine is C_5H_4, alcohol is $C_4H_6O_2$, and morphia is $C_{34}H_{19}NO_6$.

Arbitrary symbols are occasionally used to represent important complex substances. Cyanogen is known as Cy; the organic acids are recognized by their inititial letter with the sign (—) drawn above, as $\overline{T}$ for tartaric acid, $C_8H_4O_{10}$; $\overline{A}$ for acetic acid, $C_4H_3O_3$; and $\overline{O}$ for oxalic acid, C_2O_3; while the alkaloids are represented by their initial letter or letters with the sign (+) above; thus, $\overset{+}{S}r$ for strychnine, $C_{42}H_{22}N_2O_4$; $\overset{+}{M}o$ for morphia, $C_{34}H_{19}NO_6$; and $\overset{+}{Q}$ for quinine, $C_{40}H_{24}N_2O_2$.

Occasionally, in treatises on mineralogical chemistry, arbitrary modes of expressing the composition of minerals are resorted to, which it is not necessary here to explain. See CHEMISTRY.

CHEMICAL TOYS, which in the course of recent years have been brought prominently before the public, deserve a brief notice. 'Pharaoh's Serpents,' which have been already described in the article SULPHOCYANOGEN, are highly poisonous, and during combustion evolve dangerous vapors. *Larmes du Diable* or 'Crocodiles' Tears,' are formed of metallic sodium, burn with extreme violence if thrown into water, or even if moistened with water, or heated, and scatter particles of caustic alkali, which may inflict serious burns. 'Sunshine in Winter Evenings,' 'Fiery Swords,' &c. are formed of magnesium, and, like the preceding, may cause serious burns. Pyroxylin, which is identical with gun-cotton, is the active agent in the various toys known as 'Will-o'-the-wisp Paper,' 'Parlor Lightning,' 'Fireflies,' &c. The use of these toys in teaching rudimentary chemistry to children and young persons is quite incommensurate with their danger.

CHE'MISTRY is that branch of natural science which takes cognizance of the changes that bodies undergo when they are influenced by affinity (q. v.). Changes that do not alter the nature and properties of substances—such as the falling of a body by gravity, or its expansion by heat—belongs to Physics or Natural Philosophy. In chemical changes, again, the properties of the substances are permanently altered. Thus, when a piece of iron is left exposed to damp air, it is after a while converted into a reddish brittle substance (rust), owing to the union with it of the oxygen of the air. Chemistry, then, may be most simply defined as that branch of natural science which considers (1.) The combination of two or more substances to form a third body, with properties unlike either of its components; and (2.) The separation from a compound substance of the more simple bodies present in it: and considering that the steps of the combination and decomposition of substances can never be correctly understood without an intimate knowledge of the properties of substances, it follows that the science of C. must likewise take into notice the description of all the simplest as well as the most complex bodies.

When the science of C. is considered as a whole, including the properties of all the elements or substances, and the combinations and changes which they can under all circumstances undergo, it is distinguished by the title of *Pure Theoretical*, or *Philosophical C.* Particular departments of C., where the science is confined to the examination of special objects, receive distinctive names; as *Physical C.*, or *Chemical Physics*, which considers phenomena bordering on natural philosophy and C.; *Mineralogical C.*, which takes cognizance of the composition of minerals; *Physiological C.*, which includes the changes which food undergoes in its transit through the animal economy, and the transformations that take place in organic substances generally; *Medical C.*, which considers the composition and compounding of medicines; *Agricultural C.*, which relates to the composition of soils and manures, the ingredients in plants, and the best modes of supplying the food they require, &c. *Inorganic C.* takes cognizance of dead matter, and the changes it undergoes, whilst *Organic C.* considers the substance obtained from plants and animals.

C. ranks as one of the arts as well as one of the sciences, and the division of *Practical C.* comprehends the rules and processes which must be followed, and the mechanical means which must be resorted to, for the successful prosecution of the art. Practical C. is subdivided into *Analytical C.* (q. v.), which is occupied with the separation of simple substances from more complex—as chlorine (Cl) and sodium (Na) from the chloride of sodium or common salt (NaCl)—and to the estimation of the quantities of the several ingredients; and *Synthetical C.*, which has for its object the union of simpler bodies to form more complex—as hydrogen (H) and oxygen (O) to form water (HO). The art of *Assaying* (q. v.) is a department of analytical chemistry. *Applied C.* includes the art of manufacturing the various substances employed in commerce and in domestic life, so far as chemical processes and application are required. It is subdivided into *Technical C.*, which relates to everything connected with the arts and manufactures; and *Pharmaceutical C.*, which takes cognizance of the substances used in medicine.

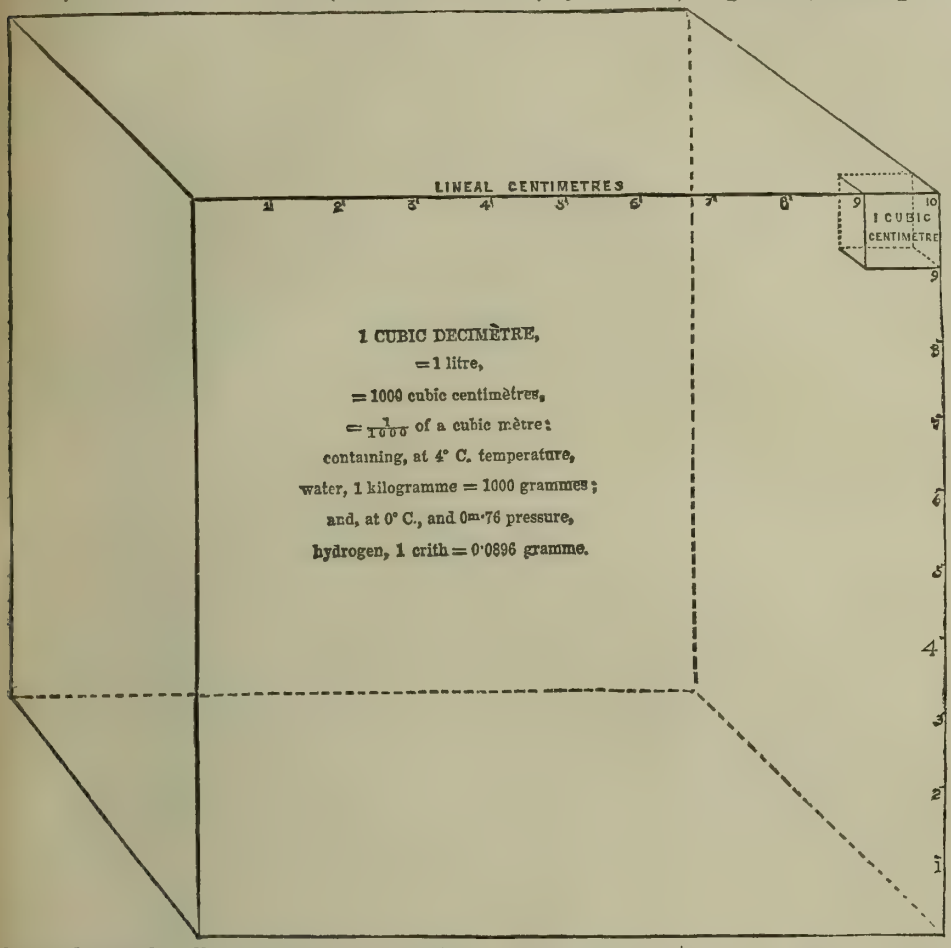
History.—The Egyptians appear to have possessed the greatest amount of chemical knowledge of all the nations of antiquity. They preserved dead bodies from decay (see MUMMY), fixed colors in silk by means of mordants, prepared many medicines and pigments, as also soap, beer, vinegar, metals and metallic alloys, common salt, vitrol, soda, sal-ammoniac, glass, enamel, tiles, and painted earthenware. The Chinese were very early acquainted with the process for dyeing, and the preparation of metallic alloys, the fabrication of nitre, sulphur, gunpowder, borax, alum, porcelain, verdigris, paper, &c. From the Egyptians, the Greeks and Romans derived what chemical knowledge they possessed; but they added little or nothing; and when the migration of the northern tribes, and overthrow of the Roman empire, took place, a stop was put for a time to the advancement of all science in Europe. The prosecution of chemical knowledge was taken up by the Arabs before the 8th c., and was carried on by them and by their European scholars the alchemists with the result described under ALCHEMY. The first germs of a real science of C. seem to appear about the end of the 17th and beginning of the 18th c., in the speculations of Becher (q. v.) and the Phlogistic theory of Stahl (q. v.). After this, C. rapidly advanced. In 1718, Geoffrey brought out the first table of *Affinities;* in 1732, Boerhaave published many original experiments on the chemical relations of heat and light; in 1724 Hales, and in 1756 Black, published researches on the air and aëriform bodies, showing that the carbonic acid evolved during fermentation, respiration, and by the action of acids on chalk, was different from atmospheric air. In 1754—1759, Margraff added to the then known earths—lime and silica—two others, alumina and magnesia; he also extracted sugar from plants. In 1770, Priestley began to announce his discoveries of oxygen, ammoniacal, hydrochloric, and sulphurous acid gases, &c. In 1773—1786, Scheele contributed chlorine, hydrofluoric, prussic, tartaric, and gallic acids; also baryta, phosphoric acid from bones, &c., and gave the first hints regarding a new doctrine of combustion. About the same time Bergman and Cavendish enlarged our knowledge of the gases. Lavoisier, between 1770 and 1794, re-organized much of the then known C., and founded a system of C. which still remains as the skeleton of the science. Barthollet, in 1787, contributed much to the doctrine of affinity, and made researches in chlorine, &c. Fourcroy and Vauquelin advanced organic C.; Klaproth gave many contributions to mineral C. Richter devoted himself to the doctrine of combining proportion, which was afterwards perfected by Dalton, as noticed under ATOMIC THEORY (q. v.). The discovery of galvanic electricity by Galvani, and its advancement by Volta, led Sir Humphry Davy and others, to important researches in the

metals and gases. Gay Lussac and Thenard advanced our knowledge regarding organic substances and the chemical relations of heat. Berzelius made laborious researches in mineral C., and gave an exactness to this department which is matter of astonishment to the chemists of the present day. He was also the author of the electro-chemical theory, which has been almost perfected by the labors of Faraday, De la Rive, Becquerel, &c. Organic C. has latterly advanced most rapidly under the researches of Liebig, Wohler, Mitscherlich, Mulder, Laurent, and others. See ATOM, ATOMIC THEORY, ATOMIC VOLUME, ATOMIC WEIGHTS, AFFINITY.

It is impossible in this article to do more than briefly describe some of the most important of the numerous changes which have been introduced into the science of chemistry within the last few years.

1. The system of measuring temperatures, lengths, weights, and volumes has been altered. The centigrade has completely superseded the Fahrenheit thermometric scale in all recent chemical works, and the French metric (which is a decimal) system has been adopted for all measurements and weights, inches and their fractions being replaced by 10ths or 100ths of a mètre, and grains by grammes. It has this advantage over all other systems, of possessing one fundamental linear unit, from which all the ramifications of linear, superficial, or solid dimensions, and of weight are derived. See MÈTRE, LITRE, GRAMME, FRANC. This unit is the 10-millionth part of a quadrant of the meridian, or of the distance from the pole to the equator. It is only to measures of weight and capacity or volume that we need here to refer. '*Multiply*,' says Dr. Hofmann in his energetic appeal in favor of the metric system, 'the cubic mètre by one million, and you have a fit measure in terms of which to express the *capacity* of the Atlantic, or its *cubical contents* of brine; *divide* the cubic mètre by one million, and you arrive at the petty volume of the gambler's ordinary die.'—*Modern Chemistry*, p. 124. This last-named volume, the millionth of a cubic mètre, taken as so much distilled water at a temperature of 4° C. (its point of greatest density), furnishes the metrical *unit of weight* called the *gramme*, which thus forms a link connecting weight with measure. Again, dividing the edge of a *mètre cube*, which is a linear mètre, into 10 parts, called *decimètres*, and cubing one of these parts, we obtain a unit of volume or capacity to which the term *litre* is applied. The various weights in use are all multiples or divisions by tens. Thus, 10 mètres form a decamètre, 100 a hectomètre, and 1000 a kilomètre; while $\frac{1}{10}$th of a mètre is called a decimètre, $\frac{1}{100}$th a centimètre, and $\frac{1}{1000}$th a millimètre, the Greek prefixes in all cases denoting multiplication, and the Latin division. The reader will do well to recollect the following rough comparisons between the chief French and English measures chiefly used in chemistry, as otherwise he can form no conception of the length, size, or weight of the substances treated of: A mètre = nearly 1·1 linear yard = 39·37 inches; a millimètre = 0·039, or nearly $\frac{1}{25}$th of an inch; a centimètre = 0·39, or nearly $\frac{2}{5}$ths of an inch; and a decimètre = 3·94, or nearly 4 inches; a gramme = 15·43 grains; and a litre = rather more than 61 cubic inches, or a pint and three-quarters.

The accompanying figure represents a cubic decimètre. Two of the edges of the front side are divided, as may be seen, into 10 linear centimètres; and the space occupied by a cubic centimètre is shown on the upper right-hand corner of the cube. Now, a cubic centimètre is employed as a unit for measures both of weight and of volume, for in the former capacity it contains, at 4° C., 1 kilogramme, or 1000 grammes of distilled water, and in the latter it loses its name of kilogramme, and receives the appellation of *litre*, which corresponds to 1000 cubic centimètres, or $\frac{1}{1000}$th of a cubic mètre. Chemists long felt the want of an appropriate *volume*, with its corresponding weight, to serve as standard units of measurement, and Professor Hofmann has selected 1 cubic decimèter=1 litre, as the most appropriate unit of volume, and the weight of this measure of pure hydrogen as the unite of weight, hydrogen being taken at 0°C. temperature, and 0m76* pressure. To this standard *weight-unit*, which = 0·0896 of a gramme, he assigns the name of *crith*, from the Greek *krithé*, a barley-corn, signifying figuratively a small weight, and the weight is now in universal acceptation amongst modern British chemists. There is no figure in chemical science more important (00·896 of a gramme) to be remembered and kept ready for calculation; for it is the standard multiple or co-efficient by means of which the weight of 1 litre of any other gas, simple or compound, is computed. 'For example, the relative volume weight of chlorine being 35·5, that of oxygen 16, and that of nitrogen 14, the actual weights of 1 litre of each of these elementary gases at 0° C. and 0m76 pressure, may be called respectively 35·5 *criths*, 16 *criths*, and 14 *criths*. So again with reference to the compound gases, the relative volume-weight of each is equal to half the weight of its product-volume. Hydrochloric acid (HCl), for example, consists of one volume of hydrogen + 1 volume of chlorine = 2 volumes, or by weight, 1 + 35·5 = 36·5 units; whence it follows that the relative value-weight of hydrochloric acid gas is $\frac{36{\cdot}5}{2}$ = 18·25 units; which last figure therefore expresses the number of *criths* which 1 litre of hydrochloric acid gas weighs at 0° C. and 0m76 pressure, 18·25 × 0·0896 = 1·6352 as the actual weight in grammes of hydrochloric acid gas. Again, as the product-volume of water-gas (H_2O),† taken at the above temperature and pressure, contains 2 volumes of hydrogen + 1 volume of oxygen, and therefore weighs 2 + 16 = 18 units, the single volume of water-gas weighs $\frac{18}{2}$ = 9 units, or substituting as before the concrete for the abstract value, 1 litre of water-gas weighs 9 *criths;* that is to say, 9 × 0·0896 gramme = 0·8064 gramme.'—*Op. cit.* p. 131. In concluding this subject we will only further remark, that when a closely approximative result suffices, the crith may be estimated at 0·09 gramme.



LINEAL CENTIMETRES
1 2 3 4 5 6 7 8 9 10
1 CUBIC CENTIMETRE
1 CUBIC DECIMÈTRE,
= 1 litre,
= 1000 cubic centimètres,
= $\frac{1}{1000}$ of a cubic mètre:
containing, at 4° C. temperature,
water, 1 kilogramme = 1000 grammes;
and, at 0° C., and 0m·76 pressure,
hydrogen, 1 crith = 0·0896 gramme.

2. Such terms as *atomic weight*, *atom*, and *molecule* are now employed in a stricter sense than formerly. Every element has been held from the time of Dalton to have a number called its atomic

* It is almost unnecessary to notice that 0m.76 signifies 0·76 of a metre, or nearly 30 inches—the ordinary atmospheric pressure at the level of the sea, and at lat. 51½°.

† The reason why the formula H_2O, instead of HO, for water is used will be presently explained.

weight. This number, according to Dr. Frankland, one of our most distinguished modern chemists, is made to represent, as far as possible : '1*st*, The smallest proportion by weight in which the element enters into or is expelled from a chemical compound—the smallest weight of hydrogen so entering or leaving a chemical compound being taken as unity. 2*d*, The weight of the element in the solid condition at any given temperature contains the same amount of heat as seven parts by weight of solid lithium at the same temperature. 3*d*, The weight of the element which, in the form of gas, or vapor, occupies, under like conditions of temperature and pressure, the same volume as one part by weight hydrogen.'—*Lectures Notes for Chemical Students*, 1866, p. 2. Recent investigations have led chemists to assign to many of the elements double the atomic weights that were previously assigned to them.* Thus, taking as formerly the atomic weight of hydrogen as the unit, the atomic weight, or as it is now often styled, the *atomic number* of oxygen is changed from 8 to 16, that of carbon from 6 to 12, that of sulphur from 16 to 32; and this doubling is by the latest writers extended to most of the elements except the halogens, nitrogen, phosphorus, boron, the metals of the alkalies, gold, and silver. The old atomic weights are still recognized as *combining* or equivalent numbers. The reason why this doubling of the number has been adopted will be presently given. The distinction between an *atom* and a *molecule* must be clearly recognized. 'We may define an *atom* of an elementary body to be the smallest proportional weight thereof which is capable of existing in *chemical combination;* and we may define the *molecule* of an elementary body to be the smallest proportional weight thereof which is capable of existing in the *free or uncombined state.*' This, which is Hofmann's definition (*Modern Chemistry*, p. 157), is now generally accepted. Thus, a molecule (or *elementary molecule*, as it is often termed) may consist either of an isolated atom, or of a group of atoms.

The bulk of a molecule, or the *molecular volume* of an element in the gaseous or vaporous state, is the same as the molecule volume of hydrogen at the same temperature and pressure, and in a large number of cases the *molecular weight* of an element is twice its atomic weight. Dr. Frankland gives the following list of the elements whose molecular volumes have as yet been determined : The molecules of mercury, cadmium and zinc contain *one* atom, and are termed *monatomic molecules;* those of hydrogen, oxygen, chlorine, bromine, iodine, fluorine, nitrogen, sulphur, and selenium contain *two* atoms, and are termed *diatomic molecules;* the molecules of oxygen, as ozone, contain three atoms, or are *triatomic;* while those of phosphorus and arsenic are *tetratomic*, and those of sulphur under certain conditions are *hexatomic*. Thus an element, as in the cases of oxygen and sulphur, may, under different conditions, have two distinct molecular weights.

3. We shall now proceed to explain the reasons why many of the atomic weights have been doubled. 'It is obvious,' says Dr. Odling, in his elaborate article on 'Atomic Weights' in Watts's *Dictionary of Chemistry*, vol. i. p. 456, 'that the atomic weights of an element and of its combinations should be selected so as to express the entire series of combinations by the simplest series of formulæ; so as best to accord with the chemical properties and metamorphoses of the bodies; so as best to illustrate their analogies with other bodies; and so as to be in relation with their physical properties, such as their specific volumes, specific heats, isomorphism, &c.' We shall endeavor to show how he applies these views to prove that, in the case of oxygen, 16 parts of that element, or the quantity thereof which unites with 2 atoms of hydrogen, is the smallest proportion of oxygen that can enter into a combination. 'We find, in the first place,' says Dr. Odling, that the quantity of oxygen contained in the great majority of definite oxidized compounds must necessarily be represented by 16, or some multiple of 16 parts. Thus, the molecules of all hydrates, double oxides, acids, oxisalts, aldehides, ketones, alcohols, oxacid-ethers, and a great number and variety of other compounds, doubtless forming together 99 per cent. of all known compounds of oxygen, cannot be represented save with 16 parts, or some multiple of 16 parts of oxygen. For example, the molecules of *hydrate of potassium*,† *benzoic aldehyde acetone*, *chloral*, *hypochlorite of sodium*,† &c., each contain 16 parts of oxygen. The molecules of *spinelle*, *brown hæmatite*, *camphor*, *benzile*, *acetate of sodium*,† *benzoic acid*, &c., each contain twice 16 parts of oxygen. The molecules of *nitric acid*, *glycerin*, *chlorate of potassium*,† *salicylic acid*, *augite*, &c., each contain three times 16 parts of oxygen.' We need not carry the quotation further, it being sufficient to remark that Dr. Odling gives similar lists of substances whose molecules each contain 4, 5, 6, 7, &c. times 16 parts of oxygen. Hence it follows that, when two bodies only differ in composition by the different proportions of oxygen which they contain, that difference amounts to 16 parts, or some multiple of 16 parts of oxygen. This is well shown in the two following series of bodies given by Odling, in the former of which the symbols are arranged according to modern views :

* The article 'Atomic Theory' in the body of the work has been rewritten in accordance with the new views.

† In these cases, one of the new forms of nomenclature is introduced.

KCl, Chloride of potassium.	C_4H_4, Ethylene.
$KClO_2$, Hypochlorite of potash.	$C_4H_4O_2$, Aldehyde.
$KClO_4$, Chlorite of potash.	$C_4H_4O_4$, Acetic acid.
$KClO_6$, Chlorate of potash.	$C_4H_4O_6$, Glycolic acid.
$KClO_8$, Perchlorate of potash.	$C_4H_4O_8$, Glyoxylic acid.

It is obvious that in both these series each term differs from the preceding one simply by O_2, or 16 parts of oxygen. Again, the quantity of oxygen which can be liberated by any reaction, and which, either alone or in the form of water, can be added to or separated from a compound, must be 16, or some multiple of 16 parts. Thus, each molecule of nitrate of soda (NaO,NO_5), when decomposed by heat, yields nitrite of soda (NaO,NO_3) and O_2 (or 16 parts of oxygen); similarly, each molecule of permanganate of potash, when decomposed by sulphuric acid, yields manganese—alum, and O_4 (or twice 16 parts of oxygen); and each molecule of chlorate of potash (KO,ClO_5) is decomposed by heat into chloride of potassium (KCl) and O_6 (or three times 16 parts of oxygen). Again, water (and consequently its main constituent, oxygen) is always eliminated in double or some higher even atoms. Thus, formic acid ($C_2H_2O_4$) yields carbonic oxide (C_2O_2) and two atoms of water (H_2O_2); alcohol ($C_4H_6O_2$) yields olefiant gas (C_4H_4) and two atoms of water (H_2O_2); oxalate of ammonia (NH_3,C_2HO_4) yields cyanogen (C_2N) and four atoms of water (H_4O_4); and innumerable additional examples might be given. On these grounds (and many additional ones might be adduced if space permitted) it becomes obvious that if the vast majority of oxidized bodies were correctly formulated, they would be represented more simply by the formulæ in which O = 16 than by formulæ in which O = 8. Reasons of a similar nature have led to the duplication of the atomic weight of carbon, sulphur, and many of the other elements. There must obviously be some means of distinguishing when O indicates 8 or 16 parts of oxygen, C indicates 6 or 12 parts of carbon, &c. Various modes of distinction have been adopted by different chemists. In Watts's *Dictionary of Chemistry* (published between 1863 and 1868), the new atomic weights are represented by the same symbols which have hitherto been adopted for the old weights; while the latter (when they are occasionally introduced) are printed in italic capitals; thus, water is represented by H_2O in the new and by *HO* in the old system, acetic by $C_2H_4O_2$ in the new and by $C_4H_4O_4$ in the old system, &c. A more common means of indicating when the value of the symbol of an element is doubled in value is by drawing a horizontal bar through it, a notation due to Berzelius; thus, $\bar{C},\bar{O},\bar{S}$, represent respectively an atom of carbon, of oxygen, and of sulphur in the new system. This system is useful in forming, as it were, a bridge to facilitate the passage from the old to the new system, and will gradually disappear when all chemists recognize the doubled atomic weights. Naquet, Miller (in the 3d edition of his *Chemistry*, 1864, and others, adopt this *barred* system, and the latter frequently gives the formulæ pertaining to both systems; for example, $FeO,SO_3.HO,6HO$, or $\bar{Fe}\bar{S}\bar{O}_4.H_2\bar{O},6H\bar{2}\bar{O}$, represents the composition of the crystallized sulphate of protoxide of iron often described as protosulphate of iron.—*Inorganic Chemistry*, 3d ed., p. 6. Some writers, as Frankland, in his *Lecture Notes for Chemical Students*, 1866, following the plan of Watts and the contributors to his Dictionary, unreservedly adopt the doubled atomic weights, and represent them by the old formulæ; thus, O, C, and S represent in these works precisely double the weight of oxygen, carbon, and sulphur that these capitals represent in the 1st and 2d editions of Miller's *Chemistry*, Fownes's *Manual of Chemistry*, and other standard works published a few years ago. It is now customary for the writers of chemical papers who object to the barred symbols as being unseemly, to insert at the commencement C = 6, O = 8, or C = 12, O = 16, in order that the reader may be able to recognize which system is adopted.

Chemical Nomenclature is still in an unsettled state. The chemists of all countries are, with one notable exception, agreed as to the names and symbols which should represent the different elements. The French chemists persist in designating nitrogen by the name of *azote*, and of using Az instead of N for its symbol; and in Italy the term *azoto* is still employed, but as it is often coupled with the symbol N, it will probably soon be exchanged for the more general term nitrogen. When the elementary bodies unite together, they form a *binary compound*. The nomenclature of the binary compounds is in a transitional state. The compounds of sulphur with metals used to form *sulphurets*, latterly they have been termed *sulphides*, and now they are denominated after a third fashion; sulphuret of potassium (for example), after having been for some years sulphide of potassium, now being termed *potassic sulphide*. In order to obtain uniformity, the following rule is adopted by the representatives of the modern school. The names of binary compounds are formed from those of their constituents, the English or Latin name of the positive constituent with the terminal *ic* preceding that of the negative constituent, which is made to end in *ide*. Thus: potassium and sulphur form potassic sulphide; sodium and oxygen form sodic oxide (formerly soda or oxide

of sodium); silver and chlorine form argentic chloride (formerly chloride of silver); lead and iodide form plumbic iodide (formerly iodide of lead); calcium and chlorine form calcic chloride (formerly chloride of calcium), &c. When the same elements form two compounds, the one which contains the smallest proportion of the negative element is distinguished by changing the terminal syllable of the name of its positive constituent into *ous*, while the terminal *ic* is retained or the compound containing the larger proportion of the negative element. Thus, 1 atom of iron and 1 atom of oxygen form *Ferrous oxide* (the old protoxide of iron); 2 atoms of iron and 3 atoms of oxygen form *Ferric oxide* (the old peroxide of iron). Sometimes the same elements form more than two compounds with one another, and then the prefixes *hypo* and *per* are employed. When a binary compound contains oxygen, and becomes an acid when made to unite with water, or becomes a salt when united to a base, it is termed an *Anhydride* (q. v.) or *anhydrous acid*. Thus 1 atom of carbon and 2 atoms of oxygen form *carbonic anhydride*, formerly known as carbonic acid gas; 1 atom of sulphur and 3 atoms of oxygen form *sulphuric anhydride*, &c. In a considerable number of cases, the trivial or common name has not been displaced by the new systematic name; thus water ammonia, hydrochloric acid, phosphuretted hydrogen, sulphuretted hydrogen, &c., are not as yet replaced by hydric oxide, hydric nitride, hydric chloride, hydric phosphide, hydric sulphide, &c.; and soda and potash are still preferred by some chemists to sodic and potassic hydrates.

The term *acid* was originally applied only to substances which, like vinegar possessed an acid taste; it is now made to include a large number of compounds which do not possess this property. The most general definition of acids is that of Gerhardt, which is adopted in Watts's *Dictionary of Chemistry*—namely, that 'acids are salts of hydrogen.' A more intelligible definition to ordinary readers is that which is adopted by Frankland, in which an acid is described 'as a compound containing one or more atoms of hydrogen, which become displaced by a metal when the latter is presented to the compound in the form of a hydrate.' Thus, using the new nomenclature and atomic weights, nitric acid and sodic hydrate yield sodic nitrate and water—

	Nitric Acid.		Sodic Hydrate.		Sodic Nitrate.		Water.
or,	NO_3H	+	NaOH	=	NO_3Na	+	H_2O,

in which reaction the hydrogen of the nitric acid is displaced by the sodium of the sodic hydrate (or soda), and as only *one* atom of hydrogen is displaced, nitric acid is said to be *monobasic*. When an acid admits of the displacement of two atoms of hydrogen, it is termed *dibasic*—as tartaric, oxalic, and, according to recent views, sulphuric acid; and when three atoms can be replaced—as in the case of common phosphoric acid, H_3PO_4, in which H_3 may be displaced by K_3 or Ag_3, the acid is termed *tribasic*. The nomenclature of the compounds of acids with bases is still unfixed. The names of the alkali-metals (potassium, sodium, and lithium) and alkaline-earth metals (barium, calcium, &c.) are now commonly substituted for those of their oxides in the nomenclature of the corresponding oxygen salts—as, for example, *carbonate of sodium* and *sulphate of caicium* for carbonate of soda and sulphate of lime. The names of these bodies are thus brought into uniformity with those of the salts of iron, copper, &c. In Watts's *Dictionary* and Frankland's *Lecture Notes* such compounds are denominated *sodic carbonate, calcic sulphate, sodic nitrate*, &c.; and these terms will doubtless soon be generally adopted for the metallic salts of the oxygen-acids generally. The nomenclature of complex inorganic bodies is founded, for the most part, on the theory of types, the names of particular compounds being obtained from the name of the type by prefixing to it adjectives which express the nature of the element by which the hydrogen of the type is replaced and the number of atoms of it contained in one molecule of the compound. By way of illustration, we give a simple and a complicated example:

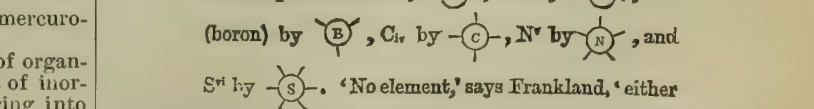
$Bi\begin{cases}Cl\\O\end{cases}$ = bismuthic oxychloride, while $\begin{matrix}Hg_4\\H_4\end{matrix}\begin{cases}Cl_2\\O_2\\N_2\end{cases}$ = tetramercuro-tetrahydric dioxi-dichloro-dinitride. The nomenclature of organic compounds is founded on the same principles as that of inorganic bodies; but our limited space prevents our entering into this subject.

Chemical Notation has been considerably altered by certain members of the recent chemical school; but on the whole, the modifications, since the time when the system of Berzelius was introduced into England in the third edition of Turner's *Elements of Chemistry*, are not numerous. The most important are the introduction of 'general formulæ' by Gerhardt, in which letters of variable value are used as coefficients instead of numbers, and Odling's method of denoting the atomicity of polyatomic elements and radicals by means of accents placed above the symbols, which are then called dashed symbols. See TRIADS. Chemists are still at variance as to whether, when two or more atoms are represented in a compound, the figure indicating the repetition should be above or below the symbol; whether, for example, water should be represented by H^2O or H_2O, and alcohol by C^2H^6O or C_2H_6O. The *ordinary* or *dualistic* system, according to which the elements combine in couples to form compounds, which similarly unite by twos, led to the division of salts into two classes—viz., into salts composed of an oxygen acid and an oxygen base, which were hence called oxygen salts, as NaO,SO_3, and KO,NO_5, which in the old notation represent sulphate of soda and nitrate of potash; and binary or haloid salts, of which chloride of sodium, NaCl, is the type, which are formed by the union of the radical in hydrogen acids with some metal. Davy considered that the former class might be made similar to the latter by regarding them as composed of a metal and a compound radical having the same electro-negative chemical relations as the radicals in the hydrogen acids. According to this view, a radical, SO_4, not yet isolated, combines with hydrogen to form sulphuric acid, and with a metal to form sulphates, sulphuric acid being represented by H,SO_4, and sulphate of lime by Ca,SO_4. In like manner, nitric acid and the nitrates were supposed to contain a radical, NO_5. Against this view Gerhardt urges that we know nothing of the proximate constitution, but are merely acquainted with the ultimate composition of compounds. Hence we now no longer use a formula for sulphuric acid indicating its supposed constitution (HO,SO_3) but regarding it as a dibasic acid, express it, either as Miller does, by H_2SO_4, or by H_2SO_4 (where S = 32 and O = 16), or by $\begin{matrix}SO_2\\H_2\end{matrix}\Big\}O_2$, if we adopt the type-notation; and we must not omit that Frankland, who may be regarded as the leading representative of the English school of modern chemistry, represents it by the formula SO_2Ho_2, when Ho is the abbreviated formula for HO, and represents a compound radical, to which he gives the name of hydroxyle, and which is commonly known as binoxide of hydrogen, being expressed, according to the old system, by HO_2. The following examples may enable the reader to pass from one system to another:

	Old System.	Barred System.
Sulphate of potassium	KO,SO_3	$K_2\overline{SO}_4$
Sulphate of zinc	$ZnO,SO_3.7HO$	$\overline{Zn}\overline{SO}_4.7H_2O$
Nitric acid	HO,NO_5	$HN\overline{O}_3$
Nitrate of sodium	NaO,NO_5	$NaN\overline{O}_3$

	New Atomic Weights.	Frankland's Notation.
Sulphate of potassium	K_2SO_4	$SO_2Ko.$
Sulphate of zinc	$ZnSO_4.7H_2O$	$SOHo_2Zno''.6OH.$
Nitric acid	HNO_3	$NO_2Ho.$
Nitrate of sodium	$NaNO_3$	$NO_2Nao.$

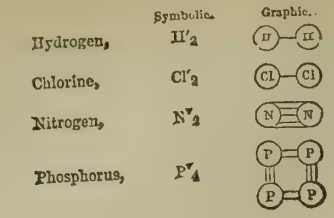
The Ko, Zno", and Nao in Frankland's notation represent compound radicals, to which he has given the names potassoxyl, zincoxyl, and sodoxyl, and which are represented in the ordinary new notation by KO,ZnO_2 and NaO. These new names will probably soon get into general use in consequence of Frankland's great influence as the teacher of chemistry in the government School of Mines, and at the Royal institution.* We must refer to the article TRIADS for a description of what is meant by *atomicity*, or, as Hofmann terms it, *quantivalence*, and the reader will do well to study Lectures 10 and 11 of his *Modern Chemistry*. In the article just mentioned, we have stated that the degree of atomicity of an element is indicated by the number of dashes with which it is furnished. In the so-called *Graphic Notation*, which, in the hands of Kekulé, Crum Brown, Naquet, Frankland, and others, has proved a most valuable aid in explanation of the constitution of chemical compounds, the degree of atomicity of an atem is



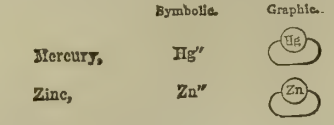
alone or in combination, can exist with any of its bonds disconnected; hence the molecules of all elements with an odd number of bonds are generally diatomic, and always polyatomic—i. e.,

* Another peculiarity of Frankland's notation is the introduction of thick letters (Egyptian capitals). His formulæ are so written as to denote that the element represented by the first symbol of a formula, and printed in this type, is directly united by points of attachment or *bonds* with the other elements or compound radicals following the first symbol. Thus, to use his own illustration and notation, the formula $SO2Ho2$ (sulphuric acid) signifies that the hexad atom of sulphur is combined with the four bonds of the two atoms of oxygen, and also with the two bonds of the two atoms of hydroxyl. (By hexad we mean an atom with six bonds, one of which is subsequently figured in the text.)

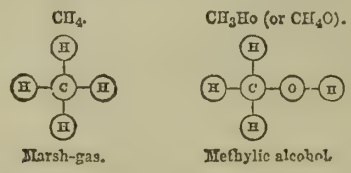
they contain two or more atoms of the element united together. Thus:



An element with an even number of bonds can exist as a monatomic molecule, its own bonds satisfying each other. Thus:



This graphic notation is most useful in fixing upon the mind the true meaning of symbolic formulæ, and in elucidating the internal arrangement of the very complex molecules which often occur in both mineral and organic compounds. It also affords an easy means of showing the causes of isomerism in organic bodies. The following example will suffice to illustrate our meaning. The simplest of the alcohol family, methylic alcohol, is derived from marsh-gas by the substitution of one atom of Frankland's hydroxyl, Ho or HO (O = 16), for one of hydrogen.



The Classification of Organic Compounds has, during the last few years, been much improved. Until a comparatively few years ago, organic compounds were arranged, according to the most obvious properties, into acids, bases, fatty bodies, &c. Now the great majority of these compounds are arranged in series, of which each group differs from the preceding one by a fixed additional number of certain atoms. Thus (see Armstrong's *Organic Chemistry*, pp. 143, 144) twelve alcohols are represented by the general formula $C_nH_{2n+2}O$ (new notation), the first being represented by CH_4O, and the others differing from it by an additional number of multiples of CH_2. Bodies of analogous properties thus united are termed *homologous*. Again, every compound in a homologous series yields other compounds differing in composition from that from which they are derived, but yet bearing a different relation to it. Thus, alcohol yields ether, aldehyde, and acetic acid, and these so-called *heterologous* bodies form collateral series.

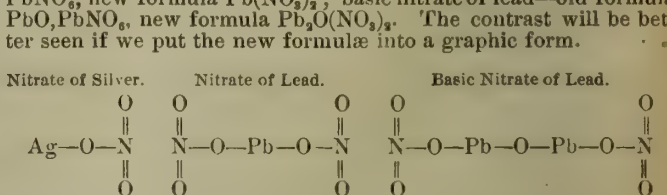
This mode of classification is daily extending. It includes *the organic radicals*, such as methyl, ethyl, allyl, phenyl, cyanogen, &c.; the *hydrides of the compound radicals*, such as methylic hydride or marsh-gas, benzol, cyanic hydride or hydrocyanic acid, &c.; the *alcohols*, which form one of the most important of the families of organic compounds; the *aldehydes* and *ethers*, both of which are specially described; the *acids*, of which the monobasic acids alone include six series, amongst which are the acetic or fatty series, represented by the general formula $C_nH_{2n}O_2$, and containing 19 or 20 distinct acids, the oleic series, the lactic series, the benzoic or aromatic series, &c.—while the dibasic acids may be divided into four series, in which occur the succinic series, containing nine acids, most of which present several modifications, and the tartaric series; the *Anhydrides* (q. v.), of which those belonging to the acetic acid group may be arranged in series; the *ketones* or *acetones*; the compounds of nitrogen containing the *amines*, *amides*, *imides*, &c.; and, in short, excepting the natural alkaloids, the protein-compounds, and their derivatives, the uric acid group, pigments, &c., there are comparatively few organic compounds which have not found a definite place in a series.

In this article we have strictly confined our remarks to the subjects, bearing on general, and for the most part on theoretical chemistry. We may, however, allude, in conclusion, to two subjects, which have undergone a great development during the last few years—viz., *Volumetric Analysis* and the *Synthesis of Organic Bodies*, both of which are discussed in special articles.

The general tenor of this article shows that chemistry is at present in altogether a transitional state. As Professor Anderson of Glasgow observes in his address to the Chemical Section of the British Association in September 1867, the atomic theory, which, at the commencement of the present century, sufficed to explain all the facts of chemistry that were then known, is now quite inadequate to that end. At that time, chemists were acquainted with comparatively few compounds, and in these, oxygen was of such preponderating importance, that the science might have been almost termed 'the chemistry of oxygen.' Oxygen is now deposed from its high place, and is supplanted by carbon to such a degree, that one of the first living chemists has actually proposed for organic chemistry the name of 'the science of the carbon-compounds.' Facts gradually accumulated in the course of time which did not admit of explanation on the Daltonian theory; and as their number increased, such terms as catalysis, allotropy, &c., were invented, under which such facts were grouped together as were supposed to depend on similar causes. Such grouping may have certain temporary advantages, provided it is understood that, to use Professor Anderson's words, it is 'the grouping of ignorance.'

It is indeed obvious that a true theory of chemistry must be a part of a general theory of dynamics, and that until we obtain some more distinct idea of how the atoms are grouped in the molecules of substances (see ATOMIC THEORY) than we at present possess, the link connecting theoretical chemistry and theoretical dynamics is wanting. The doctrine of *Atomicity* evidently points to some general truth; it has been of great use in grouping together numerous facts, and in leading to investigations which have resulted in the discovery of many new facts and new generalizations, but we now want an explanation of this doctrine, and this chemistry does not appear to be able to give us. The want of a theoretical explanation does not, however, render a generalization valueless, and much progress has been made of late years in ascertaining the 'chemical structure' of substances—that is, in obtaining graphic formulæ, which consistently represent all the reactions by which the substances are formed or transformed. Before discussing the subject of chemical structure, it will be well to consider somewhat more fully than has been done above, the reasons why certain numbers have been selected for the atomic weights of the elements rather than any multiples or submultiples of them (see ATOMIC WEIGHTS). It was pointed out by Dulong and Petit that a close relation exists between the specific heat of a solid elementary substance and its atomic weight. Thus, if we take the old system of *Atomic Weights* (q. v.), and multiply the specific heat of each solid element by its atomic weight, we find that the elements form three groups. In the first, the product of specific heat into atomic weight, or *atomic heat*, varies from 6 to 6·6. In the second it varies from 3 to 3·3. In the third group, containing the allied elements, carbon, boron, and silicon, no regularity was traced. By far the greater number of solid elements belong to the first or second group. Now it is plain that the atomic heat of a member of the first group is approximately double that of a member of the second group. But as the atomic weights are to a certain extent arbitrary, we can make the atomic heats of the two groups agree by doubling the atomic weights of the members of the second group. This was first proposed by the eminent Italian chemist, Cannizzaro, and has now been accepted by most chemists. These new atomic weights not only greatly simplify Dulong and Petit's law, but are also in harmony with many other facts, most of which were observed after the change had been made. Thus the formulæ of corrosive sublimate, bichloride of tin, and zinc methyl are, according to the old system, HgCl; $SnCl_2$; and ZnC_2H_3 and H = 1. According to the new system they are $HgCl_2$; $SnCl_4$; and ZnC_2H_6.

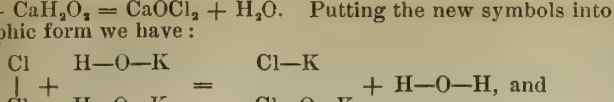
It will be at once observed that the second set of formulæ represent just twice the quantity represented by the first; now the second formulæ express the *molecular weights* of the substances according to Avogadro's law (see ATOMIC THEORY). Further, if we adopt the old atomic weights, we see no reason why oxide of lead should readily form basic salts, while oxide of silver does not. This peculiarity is to some extent explained by the new atomic weights; thus we have nitrate of silver—old formula $AgNO_6$, new formula $AgNO_3$; nitrate of lead—old formula $PbNO_6$, new formula $Pb(NO_3)_2$; basic nitrate of lead—old formula $PbO,PbNO_6$, new formula $Pb_2O(NO_3)_2$. The contrast will be better seen if we put the new formulæ into a graphic form.

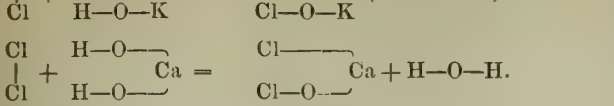


We at once see the connection between the dyad character of lead (—Pb—), and the occurrence of basic salts.

Similarly we know that if we pass a current of chlorine gas into a cold solution of caustic potash, we obtain a *mixture* of chloride of potassium and hypochlorite of potash—$Cl_2 + 2KHO = KCl + KClO + H_2O$. But that if, instead of caustic potash, we take slaked lime, we obtain, not a *mixture*, but a single substance:

$Cl_2 + CaH_2O_2 = CaOCl_2 + H_2O$. Putting the new symbols into a graphic form we have:





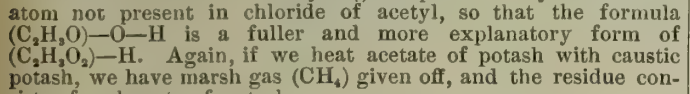
Where we see why we have a mixture in the first case, and a single substance in the second, the reason being that calcium being a dyad, one atom of it represents two atoms of potassium. Many other examples might be given, but these may suffice as an indication of the reasons which have induced chemists to prefer the atomic weights given in the second column in the table in the article ATOMIC WEIGHTS.

Assuming, then, these atomic weights, let us return to the subject of *Chemical Structure*. This may be defined in various ways, but most conveniently as the indication by a graphic formula, or something equivalent to it, of all the chemical changes by which the substance can be formed or decomposed. This will best be illustrated by means of a few examples, and we shall select these from among organic compounds—that is, compounds of carbon, because the structure of these compounds has been most fully investigated.

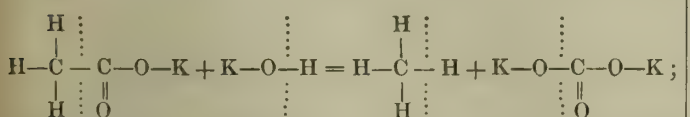
Acetic acid has (on the new system, which will be exclusively used in the remainder of this article) the formula $C_2H_4O_2$. If it is treated with caustic potash, it yields acetate of potash according to the equation $C_2H_4O_2 + KHO = C_2H_3KO_2 + H_2O$. Here one atom of hydrogen has been replaced by one atom of potassium, and we find that further treatment with caustic potash does not cause any further replacement of hydrogen by potassium. We may therefore write the formula of acetic acid thus: $H—(C_2H_3O_2)$, and this formula indicates the replaceability of one atom of hydrogen by metal, and explains (as far as such formulæ can *explain* anything) the occurrence of such compounds as acetate of lead $(C_2H_3O_2)—Pb—(C_2H_3O_2)$, and all the other acetates. The question now remains, what is the structure of the group $(C_2H_3O_2)$, which is united in acetic acid to hydrogen, and in the acetates to metal?

To answer it we must examine some other reactions of acetic acid. When treated with pentachloride of phosphorus, it loses an atom of oxygen, the place of which is taken by two atoms of chlorine—the pentachloride of phosphorus taking the oxygen in exchange for the chlorine; but instead of obtaining a compound $(C_2H_4OCl_2)$, we find that the result is expressed by the equation: $C_2H_4O_2 + PCl_5 = C_2H_3OCl + HCl + POCl_3$. We thence conclude that in acetic acid the atom of dyad oxygen removed in the action given above was united to an atom of hydrogen, and to the group (C_2H_3O), and represent the change thus:

the replacement of the dyad oxygen by two atoms of the monad chlorine necessitating the falling asunder of the compound. The reactions of chloride of acetyl (C_2H_3OCl) lead us to the further conclusion that the atom of hydrogen replaceable by metal is the atom not present in chloride of acetyl, so that the formula $(C_2H_3O)—O—H$ is a fuller and more explanatory form of $(C_2H_3O_2)—H$. Again, if we heat acetate of potash with caustic potash, we have marsh gas (CH_4) given off, and the residue consists of carbonate of potash



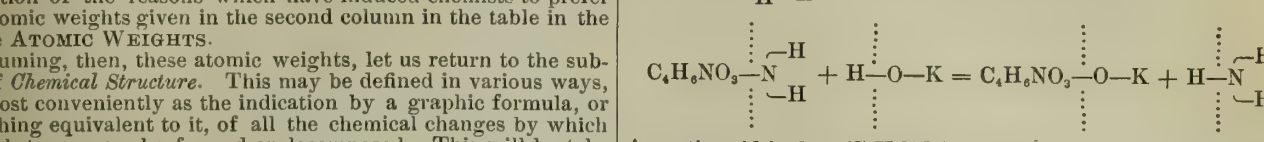
and this decomposition can only be represented if we give acetic acid the formula  ; when we have



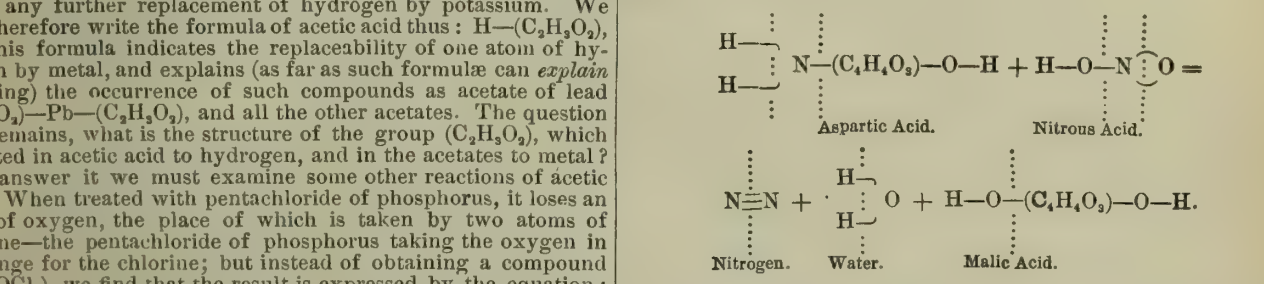
the dotted lines separating in the diagram the symbols of the parts of the molecules which change places.

We have considered only a few of the reactions of acetic acid, but the formula just given is equally consistent with all the others. It is therefore said to exhibit the *structure* of acetic acid. This word 'structure' is perhaps a little misleading—we must recollect the precise sense in which it is used, as a concise representation of many reactions. It is conceivable that it may have some relation to the actual relative position of the atoms in a molecule of acetic acid, but we have not as yet any means of ascertaining whether this is so or not.

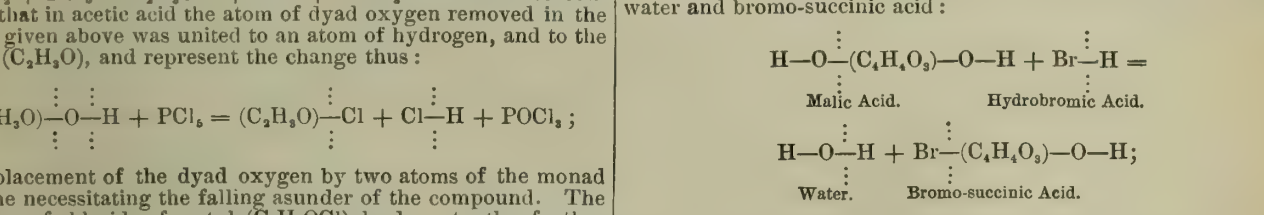
We may illustrate the meaning of chemical structure further by a somewhat more complex case. Asparagine, a colorless crystalline substance extracted from asparagus, and also from the blanched shoots of other plants, has the composition expressed by the formula $C_4H_8N_2O_3$. When treated with caustic potash it yields ammonia and a body called aspartate of potash—the potash salt of aspartic acid. The change is obviously an exchange of  and may be thus indicated:



Aspartic acid is then $(C_4H_6NO_3)—O—H$, and we have to study its decompositions in order to discover the structure of the group $(C_4H_4NO_3)$. Now, aspartic acid is attacked by nitrous acid, and the products are nitrogen gas, water, and malic acid, thus: $C_4H_7NO_4 + HNO_2 = C_4H_6O_5 + N_2 + H_2O$. Here we have the triad nitrogen of the aspartic acid replaced by the dyad O, and the monad group —O—H of the nitrous acid, and this leads to the formula  for aspartic acid. The equation above thus becomes:

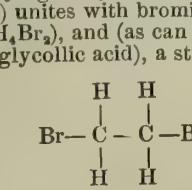


When malic acid is treated with hydrobromic acid, we obtain water and bromo-succinic acid:



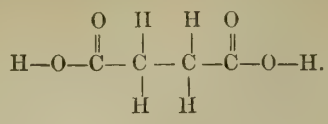
and we can prove that the group H—O—, here replaced by Br, is that one which in aspartic acid is represented by . Bromo-succinic acid, when treated with nascent hydrogen, has its bromine removed and hydrogen put in its place, thus yielding succinic acid $(C_4H_6O_4)$. We shall most easily arrive at the structure of succinic acid by studying its synthesis.

Olefiant gas (C_2H_4) unites with bromine to form a liquid having the composition $(C_2H_4Br_2)$, and (as can easily be proved by its relation to glycol and glycollic acid), a structure represented thus:

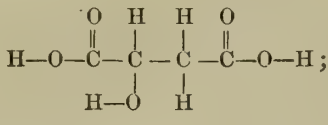


This bromide of ethylene, as it is called, when treated with cyanide of potassium, gives bromide of potassium, and a substance which may be called cyanide of ethylene—bromine and cyanogen changing places $(C_2H_4Br_2) + 2KCN = C_2H_4(CN)_2 + 2KBr$. As cyanide of potassium is $K—C\equiv N$, it follows that cyanide of ethylene is  ; when this product is boiled with caustic potash and water ammonia, is given off, and succinate of

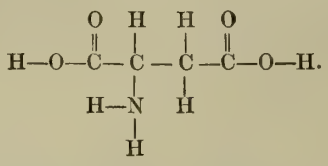
potash remains in solution. Here we have nitrogen uniting with hydrogen, while the place of the nitrogen is taken by that with which the hydrogen was united—viz., the dyad O, and the monad —O—K. We thus obtain the structural formula of succinic acid.



Here are obviously two hydrogen atoms having a different function from the rest—those, namely, which are replaceable by metal, and which, in the above formula, are represented as directly united to oxygen. That it is not one of these that is replaced by bromine follows from the fact that bromo-succinic acid has also two atoms of hydrogen replaceable by metals in exactly the same way as in succinic acid itself, and as the other four atoms of hydrogen do not differ in position in the diagram from one another, we have only one possible formula for bromo-succinic acid; and therefore, for malic acid:



and for aspartic acid:



We have, however, two possible structural formulæ for asparagine, as it is plain that the two groups H—O— in aspartic acid are not similar to one another, and we have not as yet any means of deciding between them. The reader will see that they are different, and from the way in which structure has been proved, will also see that reactions may be obtained which would decide between the two.

It is not necessary to give any further examples of chemical structure—the two we have treated in some detail may suffice to show how the principle is applied, and what is the nature of the evidence in favor of particular structural formulæ.

CHE'MISTS AND DRU'GGISTS, LAWS RELATING TO. Under the head APOTHECARY (q. v.) will be found the distinction between that profession and the kindred one of Pharmaceutical Chemist. The Pharmaceutical Society of Great Britain, founded in 1841 for raising the standard of efficiency in the practice of dispensing and compounding drugs, was incorporated by royal charter in 1843. An act was passed in 1852 defining the qualifications of pharmaceutical chemists, and the society's powers for examining and granting qualifying certificates. The Pharmacy Act of 1868, referred to below, still further defines its duties and privileges. As in the case of medical practitioners, there is no penalty for mere practice; but the assumption of the specific title named in the act is punishable by fine. The legislature presumes that certificates obtained by examination are evidence of efficient education, but that the freedom of engaging in business ought not to be interfered with; and that the right of the subject to consult whom he chooses, or to buy drugs from whom he will, must be respected. This seems a sound view. Serious mistakes, such as the substitution of one medicine for another, to the injury of the purchaser, are punishable by law, both in the unqualified and in the case of those qualified under the act. The public also derives great and increasing security in this and in all other departments of human enterprise, from the improving effect of free competition. The operation of the act was simply that of indicating to the public, by a name or title, a class of druggist possessing a higher education. In 1868, it was deemed necessary, owing to the frequent evils arising from the facility of obtaining poisons, to enact that no person should sell, or keep open shop for selling poisons, or assume or use the title of chemist or druggist or pharmacist, unless he be registered under the Act 31 and 32 Vict. c. 121, amended by 32 and 33 Vict. c. 117, and conform to the regulations as to sale of poisons. All persons who in 1868, carried on the business of chemists and druggists, and their apprentices and assistants, were entitled to be registered. The register of chemists and druggists under this act now contains the names of all qualified persons in Great Britain.

CHE'MITYPE is the name given by its inventor, C. Pül, a Dane, to the art of producing on a metal plate, by a chemical process, an engraving in relief. The outline of the process is this: On a polished plate of zinc an etching or an engraving is made in the usual way. The depressions of this design are then filled up with a melted metal—the nature of which is not revealed—and this super-added metal is then reduced to the exact level of the zinc, so that the design now appears as if inlaid.

An acid is next applied to the surface, which attacks the zinc, without affecting the inlaid metal; and thus there results an exact copy in relief of the original intaglio engraving. In competition with wood-cuts, relief-lithographs, and copperplates, C. does not seem as yet to evince any great superiority; it fails especially in that character of strength and softness which wood-cuts express so well. The prints produced by this art look more like engravings than like wood-cuts. They have this advantage, however, that they give an exact copy of the original design made by the artists on the metal; whereas in wood-cutting the drawing made on the block may be impaired in its effect by the engraver. C. is particularly adapted for producing maps by the common printing-press. Pül practised his invention at first on a small scale in Copenhagen, from 1843 to 1846, and then extensively in Leipsic. In 1850, he went to Vienna, where he was employed in the imperial printing-establishment.

CHE'MNITZ, a town of Saxony, is situated at the base of the Erzgebirge, and at the confluence of the river Chemnitz with three other rivers, in lat. 50° 50′ N., and long. 17° 55′ E. It is the principal manufacturing town of Saxony—its industry consisting in weaving cottons, woollens, and silks, and in printing calicoes, chiefly for German consumption. Cotton stockings are a most extensive manufacture, and rival the British in quality and cheapness. The American markets are chiefly supplied from this place. It has several extensive machine-factories, producing machinery for flax and wool spinning, weaving, and mining industry. Amongst the numerous educational institutes of C. are schools of weaving, mining, and tailoring. For four centuries, C. was a free imperial city. Traces of its antiquity are seen in many of the buildings. Pop. (1880) 95,123.

CHEMNITZ, MARTIN, next to Luther and Melancthon the most distinguished German Protestant theologian of the 16th c., was born at Treuenbrietzen, in Brandenburg, 9th November 1522; studied at Frankfurt and Wittenberg; and, in 1548, became rector of the cathedral-school of Königsberg. About 1550, he began to devote himself seriously to theology, and in 1553 went back to Wittenberg, where he delivered prelections on Melancthon's *Loci Communes*, from which sprang his own *Loci Theologici*, which, for method and learning, excels all similar books of the same age. In 1554, he was made a preacher in Brunswick, where he wrote his *Repetitio Sanæ Doctrinæ de Vera Presentia Corporis et Sanguinis Domini in Cœna Sacra* (Leip. 1561), in which he defended Luther's view of the Lord's Supper against that of the Swiss reformers; the *Theologiæ Jesuitorum Præcipua Capita* (Leip. 1562); and the *Examen Concilii Tridentini* (Leip. 1565), a work in which he has argued with remarkable acuteness and learning against the dogmas of the Church of Rome. His *Corpus Doctrinæ Prutenicæ* (1566), written in conjunction with Mörlin, became a standard work of divinity among the Prusian Protestants. But his greatest ecclesiastical achievements was inducing the Saxon and Swabian churches to adopt as their confession of faith the *Concordienformel*, and thus extending and consolidating the creed of Luther. He died at Brunswick, 8th April 1586.

CHEMNI'TZIA, a genus of gasteropodous-mollusca. It has a slender, elongated, many-whorled shell; the whorls striated; a simple semi-oval aperture; and a horny operculum. There are many recent species scattered all over the world. The discriminating characters of the fossil species being taken from the form of the shell, it is more than probable that the remains of very different animals are classed under this generic name. No less than 180 species have been described, occurring throughout all the divisions of the fossiliferous strata from the Lower Silurian upwards.

CHENA'B, the largest, according to general opinion, of the five rivers which give name to the Punjab. Like most of the principal streams of India, it rises to the north of the Himalayas, making its way through the Ritanka Pass at the height of 13,000 feet above the sea, and having its source about lat. 32° 48′ N., and long. 77° 27′ E. After a descent of 300 miles, the C. reaches the level country. At the close of a course of the same length, it receives, on its right, the Jhelum in lat. 31° 12′ N., and long. 72° 12′ E.; 50 miles further down, it is joined, on its left, by the Ravee; and 110 miles lower, it absorbs, through the Ghara on its left, the mingled waters of the Beas and the Sutlej. Lastly, at a distance of 60 miles, the accumulated floods, under the designation of Punjnud, lose themselves in the Indus in lat. 28° 55′ N., and long. 70° 28′ E.—being still 470 miles from the ocean.

CHENOPODIA'CEÆ, or SALSOLA'CEÆ, a natural order of exogenous plants, consisting of herbaceous and half-shrubby plants, with leaves entire or divided, and destitute of stipules. The flowers are inconspicuous, hermaphrodite, or unisexual; the perianth deeply divided, persistent; the stamens inserted into its base, opposite to its segments, and equal to them in number, or fewer; the ovary single, free, or occasionally adhering to the tube of the perianth, with a single ovule attached to the base of the cavity; the style generally with 2—4 divisions. The fruit is membranous, enclosed in the perianth, which sometimes becomes fleshy. The seed has a curved or spiral embryo.—There are about 360 known species, most of which have a weed-like appearance, and grow in waste places. They are widely diffused over the world, but are particularly abundant in the northern parts of Europe and Asia. Beet and spinage are among the best known and most useful plants of the order. Many are occasionally used as pot-herbs, as some species of *Chenopodium* and of orache. The fruit of Strawberry Blite (*Blitum capitatum* and *B. virgatum*), a common weed in the south of Europe, has some resemblance in appearance to a strawberry, from the coherence of the fleshy perianths of a whole spike or head of flowers, and a sweetish, insipid taste. The seed of Quinoa (q. v.) is used for food as a kind of grain. Some of the C. are aromatic (see CHENOPODIUM). Some inhabit salt-marshes, and abound in soda, as the Saltworts (q. v.).

Blitum Capitatum.
a, whole plant, reduced; *b*, a single flower; *c*, the same, after flowering.

CHENOPO'DIUM, a genus of plants of the natural order *Chenopodiaceæ*, of which some of the native British species are well known by the name of GOOSEFOOT, as weeds growing in gardens, on heaps of rubbish, and in waste places. The species are mostly annuals, with entire or toothed leaves, which, in some of them, have a sort of mealy hoariness. They are mostly natives of Europe, and of the temperate parts of Asia; but some are natives of America, into which, however, some of the common European species have found their way, and are naturalized as weeds. The genus has hermaphrodite flowers, with perianth of five small green scales, five stamens, and solitary flat seeds. The leaves of many species are used as a substitute for spinage, particularly those of the GOOD HENRY, WILD SPINAGE, or ENGLISH MERCURY (*C. Bonus Henricus*), a perennial plant, native of Britain and other parts of Europe, often found growing by waysides, with stem more than a foot high, powdered with minute transparent globules, and large, alternate, triangular, arrow-shaped, entire leaves. It is cultivated in some places, particularly in Lincolnshire, chiefly for the leaves, but the young shoots are also used as asparagus. *C. intermedium*, *C. album*, &c., annuals, common in waste places, are also excellent substitutes for spinage. *C. olidum* or *vulvaria* (STINKING GOOSEFOOT), an annual with an extremely nauseous odor, growing in waste places in Britain, &c., especially near the sea, is a popular medicine, in much repute as an antispasmodic and emmenagogue. *C. Botrys*, a native of the south of Europe, with pinnatifid leaves resembling those of the oak, and hence called JERUSALEM OAK, is in use as an expectorant and anthelmintic. It is not fetid like the species last named, but agreeably fragrant. *C. Ambrosioides* has a strong aromatic odor, is used in Mexico instead of tea, and is much cultivated in France, an infusion of it being deemed useful in nervous disorders. *C. anthelminticum*, the WORM-SEED of the United States, has a strong and somewhat aromatic odor, and a high reputation as a vermifuge. Its seeds are chiefly used, or the essential oil extracted from them, called *Oil of Worm-seed*. More important than any of these species, as affording a principal article of food in the countries of which it is a native, is QUINOA (q. v.).

Chenopodium Bonus Henricus:
a, upper part of stem, with flowers, reduced; *b*, *c*, *d*, separate flowers, with two, three, and four stamens.

CHE'PSTOW, a river-port in the south-east of Monmouthshire, on the right bank of the Wye, 2½ miles from its junction with the estuary of the Severn, and 14½ miles east-north-east of Newport. It lies between bold cliffs, on a slope rising from the river, in the midst of beautiful and grand scenery. There is a fine view from a rock called Windcliff, 970 feet high, three miles and a half up the river. The streets are broad. Here occurs the highest tide in Europe, rising suddenly, with a fierce current, often 50, and on rare occasions even 70 feet. Large vessels reach the town. One of the wells of the town ebbs and flows with the tide. Over the Wye is a railway bridge combining the suspension and tubular principles of construction. C. has a magnificent castle, built in the 11th c., and a fine Benedictine priory recently restored. It has few manufactures, but exports corn, cider, bark, iron, millstones, timber, and salmon. Pop. (1871) 3347; (1881) 3585. In 1880, 918 vessels, of 25,071 tons, entered and cleared the port.

CHEQUE, is a money order on a banker or other party having funds of the drawer. It must bear a penny stamp, and is payable to bearer on demand. If not presented within a reasonable time the holder shall have no claim against the drawer should the banker fail. The banker bears the risk of forgery, unless facilitated by carelessness in drawing. A C. is held as payment of a debt until dishonored on presentation; it is not payable after the drawer's death.

CROSSED CHEQUE is an ordinary C. with two transverse lines drawn across it, which has the effect of making it payable only through a banker. When a particular banker's name is written between the lines the C. is said to be *specially* crossed, and is only payable by the banker whose name it bears. Wanting a particular name, it is said to be *generally* crossed, and is payable through any banker. An ordinary C. may be crossed either generally or specially by the holder. Obliteration of the crossing or any alteration of the cheque, except as provided for by the Crossed Cheques Act (1876) is felony.

CHER, a tributary on the left side of the river Loire, rising near Crocq, in the department of Creuse; flows first north by Auzances, Evaux, Montluçon, and St. Amand; then north-west through the department of Cher by Vierzon; then westward by Selles, Montrichard, and Bléré, to the Loire, which it joins below Tours. Its whole length is about 200 miles; and it is navigable for the last 47 of its course.—CHER, the central department of France, to which the above river gives its name, is situated in lat. 46° 25′—47° 39′ N., and in long. 1° 55′—3° 10′ E. The surface is mostly level, traversed by well-wooded elevations, and produces corn, fruits, wine, hemp, flax, &c. The climate is mild and pleasant. Agriculture and pasturage of cattle are both capable of improvement. Area, upwards of 2700 square miles. Pop. (1876) 345,613. C. is divided into the three arrondissements—Bourges, St. Amand, and Sancerre. Bourges is the chief town.

CHERA'SCO, a town in the province of Cuneo, N. Italy, situated on the Tanaro, 30 m. S.E. of Turin. It has manufactures of silk, and a pop. of (1871) 4694. A peace was concluded here between Louis XIII. of France and the Duke of Savoy in 1631. On April 26, 1796, the place was taken by the French; and here, three days after, the 'Armistice of Cherasco,' was concluded between the Sardinian commissioners and Napoleon, by which the latter obtained the right of free passage for his troops through the Sardinian States; and the treaty that followed gave to the French republic Savoy, Nice, and the possessions of Piedmont to the westward of the Alps' highest ridge.

CHERBOURG, a fortified seaport town and arsenal of France in the department of Manche, is situated at the head of a deep bay on the northern extremity of the peninsula of Cotentin, on the English Channel, and opposite the west coast of the Isle of Wight, in lat. 49° 40′ N., and long. 1° 35′ W. Napoleon I. began to build the great defences of this northern stronghold of France. His nephew, Napoleon III. developed his plans, but not with the original view of an invasion of England. Occupying a prominent position on the French coast, only some 60 miles removed from the south shore of England, the harbor-works have been extended strengthened, fortified, and provisioned with cannon—the dockyards improved, and facilities of embarkation afforded, to a degree that, as it is unparalleled in ancient or modern times, not unnaturally excites the lively apprehension of Englishmen. A description of the stupendous breakwater of C., enclosing a space of nearly 2000 acres, will be found in the article BREAKWATER. In connection with its fortifications, this breakwater assumes an importance that attaches to no other work of this kind in existence. At the apex of the angle formed by the meeting of the two branches of the breakwater or *digue*, there is a center fort or battery, measuring 509 feet on the inner line of the parapet, which forms a flat semi-ellipse. The circular forts at the extremities of the breakwater are remarkably well placed for purposes of defence.

Behind the center battery there is to be an elliptical tower, measuring 225 feet on the major, and 123 feet on the minor axis. Altogether there are six large batteries on the mole. The entrances to the harbor are round the ends of the mole; and the passages are further defended by the fortifications of the Ile Pélée, and by the batteries of La Roche Chavaignac and Fort Querqueville. A series of coast redoubts, and the two large fortifications of Les Roches des Flamands and du Homet, are situated behind this outer zone of defence. 'The arsenal,' says Mr. W. H. Russell, who visited C. during the summer of 1860, 'is enclosed by a continuous line of bastion and curtain of a very elevated profile, defended by outworks, wet and dry ditches, and by profuse batteries of the heaviest guns, either in casement or *en barbette*. Wherever you look, you fancy that on the spot you occupy are specially pointed dozens of the dull black eyes from their rigid lids of stone. Altogether, besides the batteries on the mole, C. is defended by 24 regular forts and redoubts. The town itself is commanded by La Roule (an exceedingly strong fort) and Fort d'Octeville on the heights behind. The military port of C. consists of an outer harbor of 776 feet in length by 663 feet wide, its minimum depth being 58 feet, and the entrance to which is 206 feet wide at its narrowest point. This harbor communicates by means of a lock with a floating basin, 957 feet long by 712 wide.

The outer harbor has four building-slips for 120-gun ships, besides some smaller slips, and a fine graving dock. In August 1858, an inner floating harbor was inaugurated by the Emperor of the French, in the presence of the Queen and many of the Lords and Commons of Great Britain. This harbor, entirely cut out of the solid rock, has a length of about 930 yards, and a breadth of 437 yards, and is surrounded by beautiful building-slips and capacious graving docks. It is calculated that the roads of C. cannot, on account of the small depth of the greater portion, shelter more than 25 or 30 sail of the line, and about as many frigates, at one time. C. has a commercial port quite distinct from the other, situated on the south-east; but it displays little activity, the principal exports being eggs, butter, and cattle. The town itself is insignificant, the streets being narrow and dirty; and there are no public buildings of note. There are some manufactures of hoisery, chemicals, lace, and leather, and sugar and salt refineries; but the industrial energies of the great bulk of the population are absorbed in the arsenal and dock-yards. C. is a very ancient place; in the 10th c. it was known under the name of *Carusburg*. In 1758, C. was taken by the English, who destroyed the naval and military works, and levied a contribution on the town. Pop., exclusive of naval and military forces, (1876) 36,338; (1881) 35,333.

CHE'RIBON, or SHERIBON, a seaport town of Java, situated on the north coast, 125 miles east-south-east of Batavia. It has a considerable trade in coffee, indigo, and teak-wood, and is the residence of a Dutch governor. Pop. 11,000.

CHERIMOY'ER, or CHIRIMOYA (*Anona Cherimolia*), the most esteemed fruit of Brazil and Peru, now common, and even naturalized in some parts of the East Indies, and other tropical countries of the Old World. It is a fruit of most delicious flavor, is sometimes described as the finest of all fruits, and sometimes as inferior only to the mangosteen. It belongs to the same genus with the Custard Apple (q. v.). Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with blossom, the odor is so strong as to be almost overpowering. The fruit varies from the size of an orange to 16 lbs. or upwards in weight. It is roundish, or heart-shaped. Externally, it is greenish, covered with small knobs and scales. The skin is rather thick and tough. Internally, the fruit is snow-white and juicy, and contains a number of small brown seeds. The eatable part is soft like a custard, and forms almost the entire mass of the fruit. The C. attains its highest excellence only in particular soils and situations, and some varieties are much finer than others. No tropical fruit seems better to deserve a higher degree of attention than it has yet received in our hot-houses.

Cherimoyer: Branchlet with leaves, and section of fruit.

CHERKA'SK. See TCHERKASK.

CHE'RRY (*Cerasus*), a genus or sub-genus of plants, of which the best known yields one of our most esteemed stone fruits. This is usually regarded as a sub-genus of *Prunus* (see PLUM), but is erected by some botanists into a distinct genus on very slender grounds, the most obvious distinction between the species of *Cerasus* and the true species of *Prunus* being that, in the former, the young leaves are conduplicate, or folded up, and in the latter they are convolute, or rolled together. Two species are pretty generally regarded as the parents of the garden cherries usually cultivated, *Prunus* or *Cerasus Avium*, and *P. cerasus*, or *C. vulgaris*—the former having the underside of the leaves hairy and a small austere fruit; the latter having smooth shining leaves and a more juicy fruit *C. Avium* attains a height of 40—50 feet. *C. vulgaris* is a smaller tree. Both have white flowers in clusters or nearly sessile umbels, and both are generally regarded as natives of Britain, and of the middle and south of Europe. In a wild state, they are usually called GEAN (*guigne*), and *C. Avium* is frequently planted—not only because it is exceeding ornamental when in flower, but also as a timber-tree, being of rapid growth, with firm, strong, close-grained wood, suitable for the purposes of cabinet-makers, turners, and musical-instrument makers. But according to some botanists, there is only one species, of which these are varieties; and according to others, *C. vulgaris* is a native of Syria and other parts of Western Asia, and is only naturalized in Europe, having been first brought to Italy by Lucullus, after his victory over Mithridates (74 B.C.), from Kerasunt, on the coast of the Black Sea, from whence it derives its name. The cultivated varieties of the C. are very numerous, and differ very considerably in size, color, and flavor.

Common Cherry (*Ce'rasus dura'cina*): *a*, branchlet with leaves and fruit; *b*, flower.

The fruit of the C. supplies the inhabitants of some parts of France with a principal article of food, especially the wood-cutters and charcoal-burners of the forests; and among their modes of preparing it is that of making it a principal ingredient in soups. It ripens in Norway and East Bothnia as far north as lat. 63°. In some parts of Germany, the public roads are lined for many miles together with avenues of C. trees. Besides its use for the dessert and for preserves, the C. is extensively used for making liqueurs. See KIRSCHWASSER and MARASCHINO. Varieties of C. with double flowers, and with pendulous branches, are frequently planted for ornament in shrubberies, and few trees or shrubs are more beautiful. The *All-saints C.* produces flowers almost all summer, and even in autumn. Its fruit is small and rather acid.—The other species of C. are numerous. Some species are low, or even prostrate shrubs, as *C.* or *P. chamæcerasus*, the GROUND C. of the south of Europe and Siberia; and *C.* or *P. pumila*, the SAND C. of North America.—The genus or sub-genus *Cerasus* contains also the different kinds of Bird C. (q. v.) and Choke C. (q. v.), including the American WILD C., famous for its medicinal bark; the MAHALEB (*C.* or *P. Mahaleb*) of the south of Europe, and the CAPOLLIM (*C.* or *P. capollim*) of Mexico and Peru—the first famous for the fragrance of its flowers, and the second for the fragrance of its fruit; and the CHERRY-LAUREL (q. v.).

CHE'RRY-LAUREL, or LAU'REL-CHERRY, a name given to those species of *Prunus* or *Cerasus* (see CHERRY) which have evergreen leaves. They are also often called LAUREL. They have small flowers in long racemes, and small fruit; the fruit of a nauseous taste; and most parts of the plant, but particularly the leaves and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous.—The COMMON C., sometimes called the BAY-LAUREL or LAUREL-BAY, very often spoken of simply as the LAUREL or COMMON LAUREL (*Prunus* or *Cerasus Lauro-cerasus*), is a shrub, sometimes of a very large size, with ovato-lanceolate, convex, smooth, remotely serrated, shining, yellowish green leaves, and erect racemes of flowers. It is originally from Asia, but is now naturalized throughout the south of Europe, and is one one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and contain in great abundance the same essential oil (see ALMONDS, VOLATILE OIL OF), rich in hydrocyanic acid. From these leaves, by maceration in water for 24 hours, and subsequent distillation, is obtained the *Laurel-water* (q. v.), or *Cherry-laurel water*, sometimes employed in medicine as a substitute for hydrocyanic acid, and which formerly was so much used as a poison. The leaves are sometimes

employed also for flavoring puddings, sauces, &c., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution.

Another species, also very common as an ornamental shrub in Britain, but not quite so hardy as the common C. is the PORTUGAL LAUREL (*Prunus* or *Cerasus Lusitanica*), a native of Portugal, a large shrub—sometimes a tree—with dark-green leaves and lateral racemes. It does not grow so well under the shade of trees as the common cherry-laurel. From the dissimilarity of form and color of their leaves, these species present a pleasant appearance when mixed, as they usually are, in the shrubbery.

CHE'RSO, an island of Illyria, belonging to Austria, in the Adriatic, 12 miles south-south-west of Fiume. A bridge unites it with the adjoining isle of Lossini. It has an area of about 105 square miles, with a population of about 15,000. Its surface is generally hilly and rugged, with forests in the north. The chief town is Cherso, at the head of a bay on the west side. Pop. (1880) 4670.

CHERSO'N. See KHERSON.

CHERSONE'SUS, the ancient name of several peninsulas and promontories in Europe, the most important of which are the Crimea (q. v.), *C. Taurica;* Gallipoli (q. v.), *C. Thracia;* and Jutland (q. v.), *C. Cimbrica.*

CHERT, or HO'RNSTONE, a variety of quartz, always massive, and having a kind of granular appearance and structure. It is common in the Mountain Limestone, Oolite, and Green-sand formations; sometimes forms rocks; and often contains petrifactions. It passes into common quartz and chalcedony, also into flint and flinty slate. Its colors are gray, white, red, yellow, green, or brown. The name C. is sometimes limited to the finer varieties, and the coarser are called Hornstone.—The name C. is very commonly given to the silicious concretions which occur as nodules and layers in limestone rocks, like flints in the chalk. When these materials exist to such an extent as to render the limestone useless for economical purposes, it is said to be 'cherty.'

CHE'RTSEY (Anglo-Saxon, Ceort's Eye or Island) a town in the county of Surrey, on a low strip of land between the right bank of the Thames, here crossed by a stone bridge, and the brook from Virginia Water, 20 miles west-south-west of London. It is irregularly built, chiefly consisting of two long cross-streets, and is surrounded by villas. The chief trade is in malt and flour. Many vegetables are raised for the London market. Pop. (1871) 3146. C. arose in a monastery founded in 666, and rebuilt in 964 by Edgar and the Benedictine monks. The South Saxon kings had a seat here during the heptarchy. Charles James Fox lived on St. Anne's Hill, an abrupt elevation about a mile from the town. Cowley the poet resided in Chertsey.

CHE'RUB, in the plural *Cherubim* or *Cherubs*, is the Hebrew name of a winged creature with a human countenance, which in the Scriptures is almost always represented in connection with Jehovah, and especially as drawing his chariot-throne. Cherubim are first mentioned in the Old Testament as guards of paradise; a C. with a flaming sword hindered the return of the expelled human pair. In the Holy of Holies in the tabernacle, and afterwards in the temple, cherubim wrought in embossed metal were represented above the mercy-seat, or covering of the Ark of the Covenant, so that they appeared to rise out of it. Figures of cherubim are also wrought into the hangings of the Holy of Holies. The cherubim that appear in the visions of Ezekiel and the revelations of John depart much from the early representations. In Ezekiel they have the body of a man, whose head, besides a human countenance, has also that of a lion, an ox, and an eagle; they are provided with four wings, two of which support the charoit of Jehovah, and serve to fly, while the other two cover the body; the hands are under the wings, and the whole body is spangled with innumerable eyes. In the Revelation, four cherubim, covered with eyes, and having six wings, surround the throne of Jehovah; the first has the face of a lion, the second of an ox, the third of a man, and the fourth of an eagle. This gave rise at a very early period to the symbolical figures of the four evangelists, the human countenance being associated with Matthew, that of the lion with Mark, of the ox with Luke, and of the eagle with John. Most Jewish writers and Christian Fathers conceived the cherubim as angels; and Dionysius the Areopagite, in his *Celestial Hierarchy*, makes them a separate class in the first hierarchy. Most theologians also considered them as angels, until Michaelis showed them to be a political creation; and Herder, in his *Spirit of Hebrew Poetry*, compared them to the griffins that watch treasures and other fabulous figures. In Christian art, they are generally represented as sexless figures, with wings from the shoulders, the legs also being either covered by wings, or having wings substituted for them. Very often they have also a glory round the head.

Cherub.

CHERUBINI, LUIGI-CARLO-ZENOBIO-SALVATORE-MARIA, an eminent musical composer, was born at Florence in 1760, and received his early musical training there under the Felici (father and son), P. Bizzari, and C. Castrucci. He afterwards studied for a year at Bologna under Sarti, to whom he owed his thorough knowledge of counterpoint and fugue. He visited London in 1784, where he brought out two operas, *La Finta Principessa* and *Giulio Sabino*, and afterwards settled in Paris for the remainder of his life, paying occasional visits to Italy. His *Ifigenia in Aulide* appeared in 1788; and in 1791 his *Lodosika*, which work first secured proper appreciation for his genius, and effected a change in the whole character of the French school of composition. These operas were followed in succession by *Elisa*, *Medea*, *Les Deux Journées* (also known as *Die Wasserträger*), *Anacreon*, and *L'Hôtellerie Portugaise*. His latest opera, *Ali Baba*, was produced, after a long interval, in 1833. Besides operas, C. wrote numerous masses, motets, and other sacred compositions of so great merit, that Beethoven regarded him as the greatest living master of sacred music; also quartets for the violin, viola, and violoncello, and symphonies. His latest work, *Cours de Contrepoint et de Fugue*, appeared in 1835. C. died at Paris in 1842, and his *Requiem*, the last of his masses, was performed at his funeral service.

CHERU'SCI, a German tribe first mentioned by Cæsar. They dwelt north of the Silver Bacencis, or Harz Forest, but the exact boundaries of their territory cannot be ascertained. They are chiefly memorable in connection with their great leader Arminius, or Hermann, who, having formed an alliance with other German tribes, attacked and annihilated the Roman legions under Varus, in the forest of Teutoburg, 9 A.D. After the death of Arminius, internal strifes broke out among the C., and Tacitus says that they were subjugated by the Chatti, a neighboring tribe. Notwithstanding this they again appear as the chief tribe in the military league of the Saxons about the end of the 3d century. In the beginning of the 4th c., they are included among the peoples who had leagued against Constantine, and towards the close of the same are still mentioned distinctively by Claudian.

CHE'RVIL (*Anthriscus Cerefolium*), an umbelliferous plant which has been long cultivated as a pot-herb, and used in soups and for a garnish, &c., in the same manner as parsley. It is much more used in some parts of the continent of Europe than in Britain. It is a native of Europe, naturalized in some parts of England. The leaves have a peculiar, somewhat sweetish, pleasantly aromatic smell and taste, by which the plant may be known from its congener *Anthriscus vulgaris* or *Scandix Anthriscus*, a poisonous weed, whose leaves have a disagreeable smell, and which is also distinguished by its hispid fruit.

There is a variety of C. with large roots, for the sake of which it is cultivated.—The umbelliferous plant called VENUS' COMB or SHEPHERD'S NEEDLE (*Scandix pecten* or *S. Pecten Veneris*), a native of Britain and of the continent of Europe, often found in cornfields, and remarkable for the appearance and large size of its fruit, and another species (*S. australis*) which grows in the south of Europe, have a taste and smell resembling C., and are used in the same way on the continent. SWEET C. or SWEET CICELY (*Myrrhis odorata; Scandix odorata* of the older botanists), a native of the south of Europe and of some parts of Asia, common in the neighborhood of houses in Britain, although probably not a true native, is frequently cultivated in Germany under the name of *Spanish C.* or *Anise Chervil.* In Scotland, the plant is commonly called *Myrrh* by the peasantry. Its smell is peculiarly attractive to bees; and the insides of empty hives are sometimes rubbed with its leaves, to induce swarms to enter.—The species of *Chærophyllum*, coarse weeds, are also called chervil.

CHE'SAPEAKE BAY, the largest inlet on the Atlantic coast of the United States, being 200 miles long, and from 4 to 40 broad. Its entrance, 12 miles wide, has, on the north, Cape Charles, in lat. 37° 3′ N., and long. 76° 2′ W.; and on the south, Cape Henry, in lat. 36° 56′ N., and long. 76° 4′ W., both promontories being in Virginia. C. B. has numerous arms, which receive many navigable rivers, such as the Susquehanna and the Patapsco on the north, through Maryland; the James on the south-west, from Virginia; and the Potomac on the west, between these two states. Unlike the shallow sounds towards the south (see CAROLINA), this network of gulfs and estuaries, to say nothing of its noble feeders, afford depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenals of Washington.

CHE'SELDEN, WILLIAM, an English surgeon and anatomist, was born in 1688, at Burrow-on-the-Hill, in Leicestershire. He commenced his medical studies at fifteen, at twenty-three established himself as a lecturer on anatomy, and in the following year was elected a fellow of the Royal Society. He was afterwards appointed surgeon to St. Thomas's, St. George's, and Westminster hospitals, where he acquired great reputation as an operator. In this respect, few surgeons, if any, ever surpassed him. He died at Bath, 11th April 1752. C.'s principal works are—the *Anatomy of the Human Body* (1713), long a text-book on the subject in England; a *Treatise on the Operation for the Stone* (1723); and *Osteology, or Anatomy of the Bones* (1733). He also contributed several valuable papers to the Philosophical Transactions of the Royal Society.

CHE'SHIRE, a maritime county in the west of England, bounded north by the river Mersey, and partly also by the Irish Sea, in lat. 52° 56′—53° 54′ N., long. 1° 47′—3° 11′ W. Its greatest length from north-east to south-west is 58 miles; greatest breadth, 32; area, 1052 square miles, of which only $\frac{1}{18}$ is uncultivated; circuit, 200 miles, of which 8 are coast. The surface forms an extensive nearly level plain between the Derbyshire and Welsh mountains, well wooded, and studded with small lakes or meres, and chiefly occupied by grazing and dairy tracts, which are among the most important in England. This plain, comprising four-fifths of the surface, rests on new red sandstone, and is crossed, near the middle, by a tract of high ground running south-west from a promontory overlooking the Mersey, near the mouth of the Weaver, to Beeston Castle rock, 366 feet high. On the east border of the county is a line of new red sandstone hills. In the north-east is part of the Lancashire coal-field. In the east are large tracts of peat, and much of the county is wet and rushy. The north-west part of C. forms a hammer-headed peninsula called Wirral, about 8 miles broad, between the estuaries of the Dee and Mersey. Coal measures appear on the west side of this peninsula, as well as on the west border of the main part of the county. The chief rivers are the Dee, Mersey, and Weaver, which are navigable. The Dee skirts the county on the west 55 miles, and the Mersey on the north for 40 miles. The Weaver rises in the east part of the county, and runs 40 miles west-north-west into the Mersey. The county contains an almost unrivalled system of canals, including the celebrated Bridgewater Canal, and is traversed by the main line of the London and Liverpool Railway, and the Crewe, Chester, and Holyhead Railway. The chief mineral products are rock-salt and coal. The rock-salt, discovered in 1670, and mined by gunpowder, is found near the Weaver and its branches, especially near Northwich, at the depth of 28 to 48 yards, in two beds, the upper one being 15 to 25 yards, and the lower one about 40 yards thick, under a stratum of hard rock, 25 to 35 yards thick. The mines, one occupying 35 acres, when lighted up, resemble a fairy palace sparkling with gems and crystal. Much salt is also made from brine-springs 20 to 40 yards deep. Coal is worked in the north-east part of the county. There are also lead (with cobalt) and copper-mines, and in almost every part of the county free-stone, limestone, millstone, and marl are found. The climate is moist. The soil is mostly a clayey or sandy loam, with marl and peat, and very fertile. The soil and climate are well fitted for pasturing, dairy-farming, and cheese-making, which are the chief agricultural occupations. About 90,000 cows are kept in C., capable of producing about 15,000 tons of cheese. In the cattle-plague of 1855–6 upwards of 70,000 cows perished, 36,000 of these being slaughtered as a preventative. Pop. (1871) 561,131; (1881) 643,237.

There are extensive manufactures in the towns of the county, of which the chief are Chester (the county-town), Macclesfield, Stockport, Congleton, Knutsford, and Birkenhead. The county of C. returns 6 members to parliament. C. has some Roman roads, tumuli, barrows, remains of religious houses, and many old castles and halls. The 12th Roman legion occupied Chester till the 3d century. Egbert, in 828, added C. to the Anglo-Saxon kingdom of Mercia. William the Conqueror erected C. into a county palatine, under Hugh Lupus, with an independent parliament and 8 barons. Henry VIII. subordinated it to the English crown; but C. did not send representatives to the English parliament till 1549, and the separate jurisdiction ceased entirely only in 1831.

CHE'SNUT, or CHESTNUT (*Castanea*), a genus of plants of the natural order *Cupuliferæ*, closely allied to the Beech (*Fagus*), and distinguished from it by long male catkins, longitudinally set with groups of flowers, a 5—8-celled ovary, and compressed rounded nuts. The name is derived from the town of Castanum, near Magnesia, in Asia Minor. The COMMON C., SPANISH C., or SWEET C. (*C. vulgaris*), is said to have been first brought from Asia Minor to Sardinia, and from thence to have gradually extended over the south of Europe, where it has long been naturalized, and forms extensive woods. It is an ornamental, stately, or, in exposed situations, a very spreading tree, of great size and longevity, the still surviving C. of Totworth in England was known as a boundary-mark in the reign of King John. A celebrated C. tree on Mount Etna measured 204 feet in circumference of trunk. The C. has oblongo-lanceolate, accuminate, serrated, smooth leaves. The timber is durable and hard, and is used in house-building, for making furniture, and for many other purposes. The timber of the C. so much resembles that of the oak, as in old buildings to be distinguished with difficulty. The bark is used for tanning, but is worth only about half the price of oak-bark. Young C. trees are much esteemed for hop and espalier poles. The C. is therefore frequently grown in England as coppice-wood; but it succeeds well as a timber-tree even in Scotland, although it does not generally ripen its fruit. In Devonshire,

Branchlet, Leaves and Catkins of Sweet Chestnut.

however, and in some other parts of England, it is planted to a considerable extent as a fruit-tree. It succeeds throughout all the middle latitudes of Germany, but dislikes a damp foggy atmosphere. It prefers a dry light soil, and succeeds only where there is a dry subsoil.

The nuts are generally two in each husk. They form a principal part of the food of the poor in the south of Europe, being used either roasted or boiled, and often ground into flour, and made into a kind of bread. They contain 15 per cent. of sugar, and by pressure yield a sugary juice, which readily undergoes the vinous fermentation, and from which a crumb-like kind of sugar may be obtained. The best kinds of chestnuts are called by the French *Marrons*. When cultivated as a fruit-tree, the C. is generally grafted, by which means the better varieties are secured.—Other species of C. also bear eatable fruits: those of the AMERICAN C. (*C. Americana*), a tree much resembling the common C., and of the DWARF C., or CHINQUAPIN (*C. pumila*), a low tree, or more generally a shrub of 7—8 feet high, are used in America. The fruit of the Dwarf C. is of the size of a common hazel-nut; the nut is convex on both sides. The plant reaches its southern limit on the banks of the Delaware.—A number of species are natives of the East. The inhabitants of the mountains of Java eat the fruit of the SILVERY C. (*C. argentea*), and the TUNGURRUT (*C. Tungurrut*), boiled or roasted, like the common chestnut. Both of these are large trees, the Tungurrut reaching a height of 150 feet.—The HORSE C. (q. v.) is entirely different from the true chestnut.

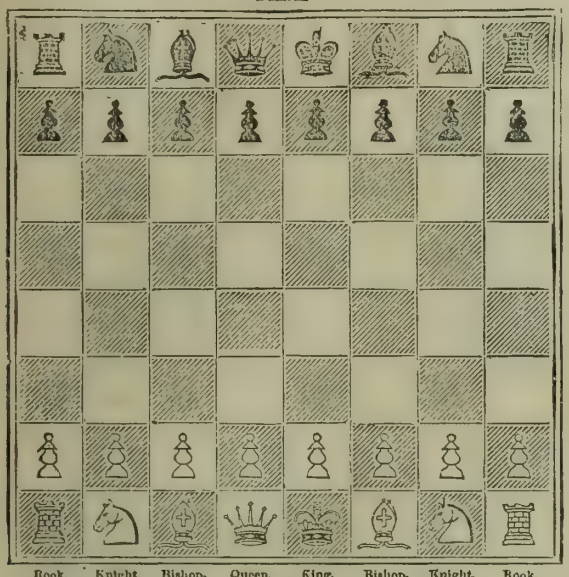
CHESS (Fr. *échecs*, Ger. *schach*). The origin of this, the most purely intellectual of all games of skill, has been much disputed; thus much may now be considered as certain, that, under the Sanscrit name of *Chaturanga*, a game, essentially the same as modern C., was played in Hindustan nearly 5000 years ago. In its gradual diffusion through the world in succeeding ages, the game has undergone many alterations and modifications, both in nature and in name; but marked traces of its early Asiatic origin and descent are still discerned by the learned in its nomenclature and other characteristics. From Hindustan, C. spread into Persia, and thence into Arabia. The Arabs, it would appear, in the 8th c., introduced the game into Spain and the rest of Western Europe; and in England, chess-play seems to have been known prior to the Norman Conquest. Into Constantinople, and probably some other cities of Eastern Europe, the game may have been imported from Persia at a period earlier than its Moorish conveyance into Spain.

The original Hindu game was played on a board of sixty-four squares, as now, but by *four persons*, two being allied against two, as in whist. Hence the name *Chaturanga*, from *chatur*, 'four,' and *anga*, 'a member' or 'component part.' The name *Shatranj*, used by the Persians and Arabs, is a corruption of the Sanscrit. The English, French, and other European names are derived from the Persian term *shah*, 'king.' *Check*, the warning when the king is in danger, is but another form of *shah*; in fact, 'king' is sometimes used for 'check,' and in German *schach* is both the name of the game and the term of warning. The term *rook* is from the Sans. *roka*, Pers. *rukh*, meaning a ship or chariot; *pawn* is said to be from *peon*, an attendant, or foot-soldier.

The books written upon C. 'would form a tolerably large library.' Of works on the antiquities of the subject, we may

mention Dr. D. Forbes's *History of Chess* (Lond. 1860). The best modern practical works on the art of chess-play are the *Chess-Player's Hand-book, C. Praxis,* and *Chess: Theory and Practice,* by Staunton; Morphy's *Games at C.*, edited by Lowenthal; Jaenisch's *Treatise on the Openings,* translated by Walker; and Horwitz and Kling's *Collection of End-games.* The subject is also pretty fully treated in Chambers's *Information for the People,* 'In-door Amusements.'

The game of C. is played upon a square board marked out into sixty-four square divisions, which are colored alternately black and white, in order the more clearly to determine and denote the respective movements of the several pieces. In placing the board for play, each player must always have a *white* corner square at his right hand. There are two sets of pieces, of opposite colors,



of sixteen men each, and of various powers according to their rank. These sets of men are arrayed opposite to each other, and attack, defend, and capture, like hostile armies. The accompanying diagram will best explain the name, form, and place of each man at the commencement of the game:

The superior officers occupying the first row on each side are called *pieces;* the inferior men, all alike, standing on the row immediately in front of the pieces, are called *pawns.* Their moves and powers, along with the peculiar terms used in C., may be briefly described as follows:

A *Pawn,* at his *first* move, may advance either one or two squares, straightforward; but after having once moved, he can only advance a single square at a time. In capturing* an adverse piece, however, a pawn moves one square diagonally either right or left; but the pawn never moves backward. On arriving at an 8th square, or the extreme line of the board, a pawn may be exchanged for any piece his owner chooses to call for, except a king; so that a player may have several queens on the board at once. If, on moving two squares, a pawn pass by an adverse pawn which has arrived at the 5th line, the advanced adverse pawn may take the other *in passing* in exactly the same manner as if the latter had moved but one square.

A Bishop moves any number of squares diagonally, but diagonally only; therefore a bishop can never change the color of his square.

A Knight moves two squares, so as always to change color—that is, he moves one square forward or backward, and one diagonally. On account of this crooked movement, he can leap over or between any surrounding pieces; and therefore a knight's check—unless he can be taken—always compels the king to move.

The Rook, or Castle, moves any number of squares forward, backward, or sidewise, but not diagonally.

The Queen is by far the most powerful of the pieces, and moves over any number of squares, either in straight lines or diagonals, forward, backward, or sidewise; so that her action is a union of that of the rook and bishop. At starting, the queen always stands on a square of her own color.

The King is the most important piece on the board, as the game depends upon his safety. He moves only one square at once, in any direction, except when he *castles*—a term to be explained presently. The king cannot be taken; but when any other piece attacks him, he is said to be in *check,* and must either move out of check or interpose some one of his subjects, unless the checking piece can be captured. When there is no means of rescuing the king from check, he is said to be checkmated, and the game is over. Of course, the two kings can never meet, as they would be in check to each other. *Double-check* is when a piece, by being moved, not only gives check itself, but also discovers a previously masked attack from another.

Castling is a privilege allowed to the king once in a game. The move is performed either with the king's rook or queen's rook—in the former case, the king is moved to the king's knight's square, and the king's rook is placed on the king's bishop's square: in the latter case, the king is played to the queen's bishop's square, and the queen's rook is played to the queen's square. But the king cannot castle after having once moved, nor at a moment when he is actually in check, nor with a rook that has moved, nor when he passes over a square attacked or checked by an adverse piece, nor when any piece stands between him and the rook with which he would castle, nor when in the act of castling either the king or rook would have to capture an adverse piece.

A *drawn* game results from neither player being able to checkmate the other; thus, a king left alone on each side must of course produce a draw, as do also a king with a bishop, or a knight, against a king.

Stalemate, or the not being able to move either the king or any other piece, also constitutes a drawn game.

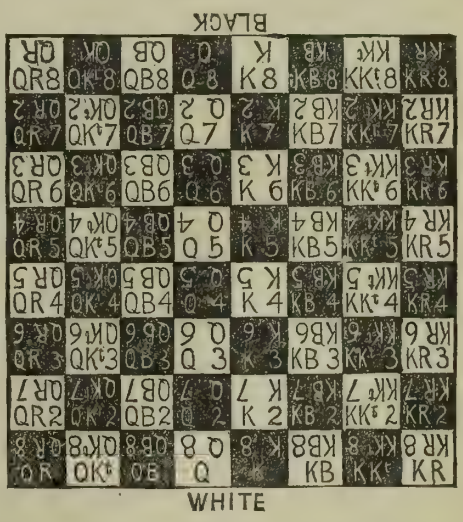
Odds is a term applied to the advantage which a stronger player should give to a weaker: thus, the removal of a rook or knight from the better player's forces may be fair odds; or if the players are more nearly matched, the one may give a pawn. When the odds of a pawn are given, it is always understood to be the king's bishop's pawn.

Gambit is a technical word implying the sacrifice of a pawn early in the game, for the purpose of taking up an attacking position with the pieces.

Supposing the worth of a pawn to be represented by unity, the following is a tolerable average estimate of the comparative value of the pieces: Pawn 1, bishop 3, knight 3, king 4, rook 5, queen 9.

The chess-men being placed, the players begin the engagement by moving alternately; each aiming to gain a numerical superiority by capturing his opponent's men, as well as such advantages of position as may conduce to victory.

The rows of squares running straight up and down the board



are called *files,* those running from side to side are called *lines,* and those running obliquely across are termed *diagonals.*

The accompanying diagram will show at once to the learner how each square is named; and by its aid he will speedily be enabled either to play over printed games, or to record his own. The playing over the following short game will serve him as a little initiatory practice.

WHITE.	BLACK.
1. King's Pawn two.	1. King's Pawn two.
2. King's Bishop to Queen's Bishop's 4th.	2. King's Bishop to Q Bishop's 4th.
3. Queen to King's Rook's 5th.	3. King's Knight to K Bishop's 3d.
4. Queen takes King's Bishop's Pawn, giving Black checkmate.	

The foregoing brief mode of giving a checkmate is called the

* Taking is always performed by lifting the captured man from the board, and placing the captor on his square. The pawn is the only man whose mode of taking differs from his ordinary move.

Scholar's mate, and is often practised upon young and unwary players. Any contractions used, such as 'K' for king, or 'B' for bishop, &c., will readily be understood by the use of the diagrams.

In the conduct of the game, and in the practice of C., the following rules, precepts, and hints will be found very generally useful:

Play forth your minor pieces early, and castle your king in good time. You may sometimes delay castling with advantage, but not often.

Do not expect to be able to establish an enduring attack with half your forces at home.

Seek to let your style of play be attacking; and remember the gaining or losing of time in your measures is the element of winning or losing the game.

Never touch a piece without moving it, nor suffer yourself or your opponent to infringe any other of the laws of the game.

You will find, when first player, that the opening, springing from your playing 1st King's pawn two, and then your King's Knight to the Bishop's 3d, is one of the best that you can adopt; but do not adhere to any one opening only.

If you wish to adopt a purely defensive opening, you may play 1st King's pawn one, and follow up with Q P 2, and Q B P 2.

Next to playing with good players, nothing will conduce to improvement more than looking on at two expert players whilst they play. Wanting these advantages, it is best to play over openings, and actual games, from books or journals.

To prevent blunders and oversights, always endeavor to perceive the motive of your adversary's move before you play; and look often round the board to see that you are not losing sight of any better move than the one you intended, or that you are not suffering yourself to be tempted by a bait.

When an onlooker, never interfere.

Always endeavor to lose with good temper, and to bear your adversary's faults with a good grace.

THE LAWS of CHESS.

The laws of C. are at present in a somewhat unsettled, unsatisfactory condition; but the following are the principal prevailing regulations of the game:

1. If any error have been committed in the placing of the board or men, either player may claim that the game shall be finished as it stands, after four moves have been completed on each side, but not else.

2. A move once made, by your having moved a piece and left hold of it, cannot be retracted.

3. If you touch a piece, you must play that piece; but as long as you retain your hold, you can play it where you like. If you touch a piece that cannot move, your opponent may compel you to play your king, unless the king be unable to move. When you touch your pieces for the mere purpose of adjusting them, you are bound to say so.

4. If you make a false move, your opponent may either cause you to retract it and move your king, or he may claim that the false move shall stand, or that you shall make a legal move with the same piece, at his pleasure.

5. If you touch one of your opponent's men, he may compel you to take that man; or if that be impossible, to move your king, provided he can move without going into check.

6. If on the king being checked, due notice is not given, the player whose king is attacked is not bound to notice it.

7. In every fresh game, except when one is drawn, the first move alternates.

8. Drawn games counting as no games at all, the player who had the first move in a drawn game is also entitled to it in the next. (This absurd regulation is fast becoming obsolete; and it is now a common agreement in playing a series of games, that the move shall invariably alternate).

9. A player who gives the odds of a piece, is entitled to the first move.

10. The time for consideration of a move is not limited; but a player leaving a game unfinished without his opponent's permission, loses such game.

11. When at the end of a game one player is left with just sufficient superiority of force to win—such as a king and rook against king, king and two bishops, or king, knight, and bishop against king—he who has the greater force must give checkmate within fifty moves on each side, or else the game is adjudged to be drawn. This law is framed to prevent unskilful players from wearying their opponents by persisting in the attempt to accomplish what they are too untutored to effect; and it is perfectly just since the allotted number of moves is amply large enough and to spare.

12. In case of any dispute about the laws, both players are to agree as to an umpire, whose decision is to be considered final.

As there is no branch of chess-study better calculated to advance the skill of a learner than the attentively playing over recorded games between first-rate players, we have given an example of a game played blindfold, simultaneously with five other games, by the celebrated American chess-player, Paul Morphy. This gentleman visited England and the continent of Europe in 1858, and in his contests with the best players fairly carried all before him, so that he soon ranked as the greatest chess-player living.

White—Mr. Morphy.	Black—Mr. C——

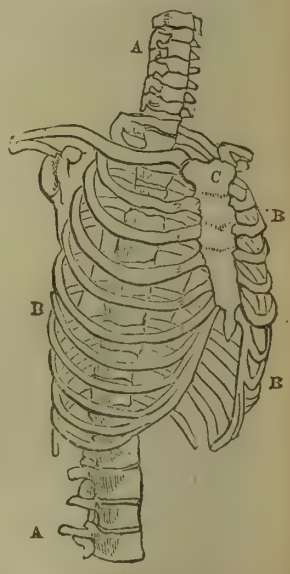
CHEST, or THORAX, in Anatomy, is the part of the body which lies beneath the neck and above the Abdomen (q. v.), constituting the uppermost of the two divisions of the trunk, or that which contains the heart and lungs, and is bounded externally by the ribs. The C. is somewhat conical in form, the broad or lower end of the cone being shut in by the diaphragm, a large muscular partition which projects upwards from the lower ribs, being convex towards the C., and concave towards the abdomen. In Respiration (q. v.), the diaphragm descends by its own muscular contraction, while at the same time the ribs are drawn upwards and outwards by the intercostal muscles. The cavity of the C. is thus enlarged, the lungs are expanded, and air is drawn into them through the trachea or windpipe and bronchi. See LUNGS. The combination of bone, cartilage, muscle, and tendon entering into the composition of the C. is such as to permit of expansion-movement to the extent required, and yet to guard against over-expansion, which would be fatal to the delicate textures within. The bones of the C. are at the same time a powerful protection against external injury.

The structures forming the walls of the C. are: 1. The backbone or spinal column, AA, divided into 24 vertebræ, 12 of which, called the dorsal vertebræ, form the thoracic portion. 2. Twelve ribs, B, B, B, attached to the transverse processes or projecting portions of the dorsal vertebræ, and ending in front in the costal cartilages, by which the ribs are connected with 3. The sternum or breast-bone, C, which occupies the middle line. 4. The Diaphragm (q. v.). See also SKELETON.



Chest.

The contents of the C. are the heart, the great arteries and veins, the lungs, the trachea or windpipe, the bronchi or branches of the trachea, leading to the lungs, the œsophagus or gullet, and the Thoracic Duct (q. v.), or general terminus of the lymphatic system of vessels, by which the chyle and lymph are discharged into the blood. The very great importance of these parts to life, and their great liability to deranged action, renders the C. the seat of a large proportion of the diseases which afflict humanity, and especially of those which end in death. Indeed, of the three organs which the great physiologist, Bichat, called the 'tripod of life'—viz., the brain, heart, and lungs—the C. contains two; hence its condition in almost all diseases, and

especially in fatal diseases, is an object of the utmost solicitude to the physician.

The diseases of the C. depend in some cases on alterations in its form, as by Rickets (q. v.) and other diseases affecting the bones in early childhood or in youth, as by too tight lacing in girls. The lungs and air-tubes are subject to a great variety of diseases, among which the principal are consumption or phthisis pulmonalis, pneumonia, pleurisy, bronchitis or pulmonary catarrh. The heart is subject to pericarditis, endocarditis, and chronic organic disease of the valves, as well as to enlargement (hypertrophy), dilatation, and degenerations of its muscular texture. The aorta, or great artery, is often affected with degeneration of its walls, and occasionally with aneurism. The great veins are liable to over-distension, and to obstruction by tumors or by coagulation of the contained blood. The thoracic duct is also sometimes obstructed by external pressure; and the œsophagus has a number of diseases usually described in connection with the alimentary canal. Most of the diseases here referred to are described either under special articles, or under LUNGS and HEART.

The examination of the C. by physicians is now conducted not only by an investigation of the symptoms or obvious characters of the disease, but by a minute and elaborate examination into the physical condition of the contained organs by means of Auscultation (q. v.), Percussion (q. v.), Measurement, &c. The application of these methods is too complicated and technical for explanation in detail, but their results will be shortly alluded to incidentally in the articles above referred to on the diseases of the chest. The name of Laennec (q. v.) will be long remembered in medicine as that of a great original observer, who has contributed more than any other to the progress of knowledge in this department.

CHEST, MILITARY, is a technical name for the money and negotiable securities carried with an army, and intended to defray the current expenses. In the English military system, this department is managed by the commissariat.

CHEST, NAVAL. The name of C. has been given to certain funds, maintained for the benefit of seamen belonging to the royal navy. A fund, called the *Chest at Chatham*, was suggested so long ago as the days of Drake and Hawkins, for the relief of wounded and superannuated seamen. In 1590, all seafaring men in Queen Elizabeth's service consented to a stoppage out of their pay of 2*d*. to 6*d*. per month, to support this fund. The money was not in those days, as it would be now, put out to interest; it was kept in a C., and hence the name given to the fund itself. During the 18th c., the system became organized in a better manner; but still the fund retained the name of C.; insomuch that when the office was removed from Chatham to Greenwich, in 1803, it became the *Chest at Greenwich*. The C. is managed *ex officio*, and the accounts are annually laid before parliament. Handsome gifts are occasionally made to the fund by individuals. Disabled sailors receive a present sum of money, if not deprived of the power of earning a living; but if their injuries are more permanent, they receive a pension from the C., for one year, or for several years, or for life, paid half-yearly.

CHE'STER, an ancient and episcopal city, municipal and parliamentary borough, and river-port, the capital of Cheshire, on the right bank of the Dee, 22 miles from the north of its estuary, 16 miles south-east of Liverpool. It stands on a rocky sandstone height, and is mostly enclosed in an oblong quadrangle of ancient walls, 7 or 8 feet thick, nearly 2 miles in circuit, and with 4 gates, and now forming a promenade with parapets, where two persons can walk abreast. The two main streets cross each other at right angles, and were cut out of the rock by the Romans 4 to 10 feet below the level of the houses. The houses in these streets are curiously arranged: the front parts of their second stories, as far back as 16 feet, form a continuous paved promenade or covered gallery, open in front where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. This arrangement, called the 'rows' together with the ancient walls, and the half-timbered construction of many of the houses, with quaintly carved ornamented gables of the 16th c., render C. perhaps the most picturesque city in England. C. cathedral is an irregular massive structure of crumbling sandstone, 375 by 200 feet, with a tower of 127 feet. It was formerly the church of the abbey of St. Werburgh, and for 650 years was one of the richest in England. St. John's Church, now partially in ruins, is supposed to have been founded by Ethelred in 698. The Dee is crossed by a superb stone arch of 200 feet span. Suburbs of villas have recently arisen outside the walls; and a public park was opened in 1867. The C. railway station is the center of several important railways. C. has manufactures of lead, iron-foundries, chemical works, and an iron-shipbuilding yard. The chief exports are cheese, copper, cast-iron, and coal. C. has many charitable and religious institutions, and is the abode of many wealthy families. Pop. (1871) 35,257; (1881) 36,788. The city is a county in itself, and till of late returned two members to parliament; but it was disfranchised for seven years from 1883 for bribery and corruption. In 1880, 2434 vessels of 179,124 tons entered the port in spite of the silting up of the mouth of the Dee.

C. was *Devana Castra*, or Colonia Devana, an important Roman station, and has yielded many Roman remains—as masonry, coins, inscriptions, fibulæ, altars, a hypocaust, and a statue of Pallas. C. was only in 828 taken by the Saxons from the Britons. Its strength made it a refuge against the descents of the Danes and Northmen, but the Danes took it in 894. Ethelfrida retook it in 904, and rebuilt the walls. From the Norman Conquest to the time of Henry III., the Earls of Chester had their own courts and parliaments at C., with 8 subfeudatories and the superiors of the great religious houses, Cheshire being then a county palatine. Henry III. made his eldest son Earl of Chester, a title held since by the Prince of Wales. Llewelyn ravaged C. in 1255. The 25 famous C. mysteries or religious plays by Randle a monk (1250—1260), were acted in the church. After a long siege the parliamentary forces defeated those of Charles I. at C., and took the city. Pearson and Porteus were bishops of Chester. Trinity Church contains the remains of Matthew Henry, the biblical commentator. The commerce of C. has steadily declined since the rise of Liverpool.

CHESTERFIELD, a municipal borough in Derbyshire, near the Hipper and Rother rivulets, 24 miles north-north-east of Derby by rail. There are manufactures of leather, silk, lace, earthenware, and machinery, and there are several blasting-furnaces in the neighborhood. The manufactures are increasing rapidly, and the minerals in the neighborhood, including coal, iron, potters' and brick clay, slates, and lead are being greatly developed. Population (1851) 7100; (1871) 11,427; (1881) 12,221. Trade is facilitated by a canal connecting C. with the Trent, and by the main line of the Midland Railway.

CHE'STERFIELD, EARL OF (PHILIP DORMER STANHOPE), an English statesman and author, eldest son of the third Earl of Chesterfield, was born in London, September 22, 1694, and studied at Cambridge. In 1714, he made the tour of Europe, and the following year was appointed a gentleman of the bedchamber to the Prince of Wales. About the same time, he was elected M.P. for St. Germains, in Cornwall. In 1726, on his father's death, he became Earl of C., and in 1727 was sworn a privy councillor. In 1728, he was appointed ambassador extraordinary to Holland, and in 1730 was made a knight of the Garter and Lord Steward of the Household, but soon resigned that office. An eloquent and frequent speaker, he took an active part in the important business in the House of Lords, and was for several years the strenuous opponent of Sir Robert Walpole, then premier. In 1744, he connected himself with the administration, and in 1745 was re-appointed ambassador to the Hague, but was soon nominated Lord-lieutenant of Ireland, where he rendered himself exceedingly popular. In October 1746, he became one of the principal secretaries of state, but two years after, declining health caused him to resign office, and in 1752 he was seized with deafness.

Distinguished by brilliancy of wit, polished grace of manners, and elegance of conversation, he lived in intimacy with Pope, Swift, Bolingbroke, and other eminent men of the day. Dr. Johnson, whose Dictionary, on its appearance, he affected to recommend, called him 'a wit among lords, and a lord among wits.' He wrote several papers, on temporary subjects, in *The Craftsman*, *The World*, periodicals of the time; but he is now best known by his *Letters to his Son*, Philip Dormer, written for the improvement of his manners. These letters have been often republished, and they afford a good idea of the mental and moral calibre of the author. Lord C. died March 24, 1773.

CHESTERFIELD INLET, a long and narrow gulf, penetrating to the westward from the north-west of Hudson's Bay. Its extreme dimensions are 250 and 25 miles; and the lat. and long. of its mouth are 63° 30′ N., and 90° 40′ W. C. I. is studded nearly throughout with islands.

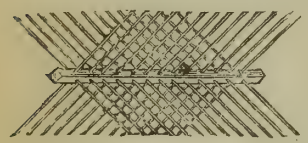
CHEVALIE'R (Fr. *cheval*, a horse), in Heraldry, a horseman armed at all points. In its more general acceptation it signifies a Knight (q. v.). See also BANNERET and CHIVALRY.

CHEVALIER, MICHEL, an eminent French economist, born at Limoges, January 13, 1806, was, at the age of 18, admitted a pupil of the Polytechnic School. Thence he went to the School of Mines, and some days before the revolution of July, he was attached as an engineer to the department du Nord. Led away by the theories of the St. Simonians, he was for two years editor of the *Globe*, the organ of that sect. Joining the schism of M. Enfantin he took an active part in the compilation of the *Livre Nouveau*, the standard of their doctrines, and in 1832 suffered six months' imprisonment, on account of his free speculations in regard to religious and social questions, being regarded as an outrage on public morals. On his liberation, he at once retracted all that he had written in the *Globe* contrary to Christianity, and against marriage, and obtained from M. Thiers a special mission to the United States, to inquire into the systems of water and

railway communication there. The results were published in his *Letters from North America* (1836, 2 vols. 8vo). After a visit to England, he issued a work, entitled *Material Interests in France; Public Works, Roads, Canals, Railways* (1838, 8vo). He was named, successively, Chevalier of the Legion of Honor, Councillor of State (1838), a member of the Superior Council of Commerce, and of the Royal Council of the University; and, in 1840, Professor of Political Economy in the College of France. In 1840, he was re-established in the Corps of Mines as engineer of the first-class; and in 1846, elected a member of the Chamber of Deputies.

Under the Republic, he lost his various employments. He published, in 1848, *Letters on the Organization of Labor and the Question of the Laborers;* and after the *coup d'état* of December 2, was restored to his professorship, and named councillor of state. In 1860, C. assisted Mr. Cobden in carrying into effect the commercial treaty between France and England, and was created a senator. He became a Grand Officer of the Legion of Honor, 1861. He died 28th Nov. 1879. W. wrote also *Political Economy* (1842—1850); *Probable Fall of the Value of Gold* (1859—translated by Cobden); *Mexico, Ancient and Modern* (1863); &c.

CHEVAUX-DE-FRISE, in Fortification, is a hastily constructed substitute for a regular abattis, to stay the progress of an advancing enemy. It may be constructed in any way of wood or iron, provided it presents an array of sharp or ragged points towards the enemy. Sometimes it is made of barrels or centers of timber, with spears springing out from all sides, in such a way as to constitute both a support and a defence. Among the *matériel* of an army under the care of the engineers, are sometimes comprised C. formed of cylindrical iron barrels, about 6 feet long, each having 12 holes to receive as many spears; the spears can be packed away in the barrel, when not in use. Each such piece constitutes a *cheval;* and many such, ranged end to end, form *chevaux,* to be used in ditches around a fortification, on the berme beneath the parapet, behind the glacis, across a breach in the rampart, or in any spot where a check to the storming-party is needed. At Badajoz, during the Peninsular war, great service was rendered by a C. formed of sword-blades fixed into beams of wood. The name is said to have been derived from 'Friesland horse,' and to have been first applied by the French during the wars of the 17th century.



Cheval-de-Frise.

CHE'VIOT HILLS, a mountain-range, occupying contiguous parts of the counties of Northumberland and Roxburgh, on the English and Scotch borders, and running 35 miles from near the junction of the Till and Tweed, in the north-east, to the sources of the Liddel, in the south-west. The highest points are C. Hill, 2658 feet, and Carter Fell, 1850. West of Carter Fell, these hills chiefly consist of carboniferous sandstone and limestone, with protrusions of trap. The east portion of the range is porphyritic, and includes higher and more or less conical hills. In the C. H. are the sources of the Liddel, Tyne, Coquet, and some of the branches of the Tweed. Grouse abound, and the golden eagle is seen. These hills afford pasture for the Cheviots, a superior breed of sheep. They have been the scene of many bloody contests between the English and Scotch.

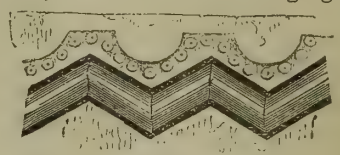
CHEVRE'TTE. See GYN.

CHEVREUL, MICHEL EUGENE, a distinguished French chemist, born August 31, 1786, at Angers, in the department of Maine-et-Loire. In 1820, he was made an examiner in the Polytechnic School; and in 1824, director of the dyeing department in the manufactory of the Gobelins. This last position led him to institute a series of accurate researches on colors, the results of which he made known in a series of *Mémoires* of the Academy of Sciences. Previous to this, C. had made himself known in the scientific world by a variety of researches and writings. In 1826, he was made a member of the Academy; and in 1830, Professor of Applied Chemistry in the Museum of Natural History. Besides a great number of articles in the *Journal des Savants,* beginning with 1820, the following works of C. deserve mention: *Leçons de Chimie appliquée à la Teinture* (1828—1831); *De la Loi du contraste simultané des Couleurs et de l'Assortiment des Objets coloriés* (1839); *Théorie des Effets Optiques que présentent les Etoffes de Soie* (1846); *De la Baguette divinatoire, du Pendule, et des Tables tournantes* (1854); *Des Couleurs et de leur Application aux Arts Industriels* (1864); and a work on a new organic acid, *L'Acide Avique* (1871). C. is a Fellow of the Royal Society of London, and a Commander of the Legion of Honor.

CHE'VRON, in Heraldry, an ordinary representing the couples or rafters of a house, and supposed to betoken the accomplishment of some memorable work, or the completion of some business of importance, generally the foundation of his own family by the bearer. The C. is formed of two lines placed pyramidically, i. e., joined together at the top, and descending to the extremities of the shield in the form of a pair of compasses. *Chevronel,* a diminutive—half the size—of the chevron. *Per chevron,* or *party per chevron,* is where the shield is divided by a line in the form of the chevron.

Chevron. Chevronel. Per Chevron.

CHEVRON, in Architecture, a moulding in the form of a succession of chevrons, otherwise called a zigzag moulding. In general, it is characteristic or Norman architecture, but it is also found with the pointed arch, during the transition period from Norman to Early English.



Chevron, or Zigzag: Andover, Hants.

CHEVRONS are braids or bands of lace, worn as distinguishing marks by the non-commissioned officers of regiments. The corporals, and the various grades of sergeant, have C. varying from one to four in number, either of white or of gold lace. In most corps, they are worn on the right arm only; but in the Guards, and some Line regiments, they are worn on both arms.

CHEVROTAINS, a family of ungulates distinct from *Bovidæ* and *Cervidæ,* and in some respects nearer to the *Suidæ.*

CHEVY CHASE, the name of perhaps the most famous of British ballads. In its present form, the piece does not seem to be older than about the beginning of the 17th c., though doubtless more ancient versions existed, and are partly incorporated. It is impossible to reconcile its incidents with history, but the event which is meant to be commemorated appears to have been the battle of Otterburn, in August 1388—a fight which Froissart declares to have been the bravest and most chivalrous which was fought in his day. According to the ballad, Percy vowed that he would enter Scotland, and take his pleasure for three days in the woods of his rival, and slay the deer therein at will. Douglas, when he heard the vaunt, exclaimed: 'Tell him he will find one day more than enough.' Accordingly, at the time of the hay-harvest, Percy, with stag-hounds and archers, passed into the domains of his foe, and slew a 'hundred fallow-deer and harts of grice.' When the English had hastily cooked their game, and were about to retire, Earl Douglas, clad in armor, and heading his Scottish spears, came on the scene. Haughty challenge and defiance passed between the potentates, and the battle joined. In the center of the fray the two leaders met, but an English arrow struck Douglas to the heart. Sir Hugh Montgomery, having seen the fall of Douglas, dashed on Percy, and struck his spear through his body a long cloth-yard and more. Although the leaders on both sides had fallen, the battle, which had begun at break of day, continued till the ringing of the curfew-bell. Scotchmen and Englishmen claim the victory. When the battle ended, representatives of every noble family on either side of the Border lay on the bloody greensward.

CHEYENNE, the capital of Wyoming territory, U.S., on a wide plain 6000 feet above the sea, 1260 miles east of Sacramento in California. It is an important station of the Pacific Railway, and has extensive machine shops and repairing places. Saddles are manufactured, and moss agate jewelry. C., settled in 1867, had in 1870 a population of 1450; in 1880, 4000.

CHEYNE, GEORGE, an eminent Scottish physician, born in Aberdeenshire in 1671, was at first intended for the church, but preferring the medical profession, studied at Edinburgh, under the celebrated Dr. Pitcairn. In 1700, after taking the degree of M.D., he repaired to London, where he practised in winter, and in Bath in summer. From full living he became enormously fat, as well as asthmatic, and resolved on strictly adhering to a milk and vegetable diet, from which he derived so much benefit that he recommended it in all his principal medical treatises. In 1702, he published *A New Theory of Fevers,* and, in 1703, a work *On Fluxions,* which procured him admission into the Royal Society. Among his other works are: *Philosophical Principles of Natural Religion,* 1705; *Observations on Gout* 1722; *Essay on Health and Long Life,* 1725; *The English Malady, a Treatise on Nervous Dis-*

orders, 1733; *Essay on Regimen*, 1739; *Account of Himself and of his various Cures*, 1743. Dr. C. died at Bath, April 12, 1743.

CHIABRERA, GABRIELLO, an Italian poet, born at Savona, 8th June 1552. He was educated at Rome under the care of his uncle, after whose death he entered the service of Cardinal Cornaro, but was obliged to leave it in consequence of the revenge he had taken on an Italian nobleman who had done him an injury. In his 50th year, he married, and remained independent for the rest of his life. He died 14th October 1637. C.'s poetical faculty developed itself late. Having commenced to read the Greek writers at home, he conceived a great admiration of Pindar, and strove successfully to imitate him. He was not less happy in catching the naïve and pleasant spirit of Anacreon; his canzonetti being distinguished for their ease and elegance, while his *Lettere Famigliari* was the first attempt to introduce the poetical epistle into Italian literature. C. also wrote several epics, bucolics, and dramatic poems. His *Opere* appeared at Venice, in 6 vols., 1768.

CHIA'NA (in ancient times, *Clanis*), a river in Tuscany, formed by several streams from the Apennines, and falling into the Arno a few miles below Arezzo. Along with another river of the same name, which, flowing in the opposite direction, enters the Paglia at Orvieto, it waters the perfectly level Val di Chiana, which its overflow rendered once the most pestilential district of Italy. Ferdinand III. and his minister, Fossombroni, undertook extensive hydraulic works for improving the bed of the river, which they led through the lakes of Montepulciano and Chiusi, and employed for the artificial irrigation of the whole valley. The district has since become the most fruitful, perhaps, of all Italy—a perfect garden, supporting a population of more than 100,000.

CHIANTI, a mountain-range in Tuscany, 15 miles N.E. of Siena. The mountain gives name to an excellent wine grown in the neighborhood.

CHIA'PA, or CHIAPAS, a state in the south-east of the Mexican confederation, lying to the south-west of Yucatan. It contains about 19,000 square miles, and 194,000 inhabitants, chiefly aborigines. Near Palenque, one of the towns of C., are most extensive and magnificent ruins.

CHIARAMO'NTÉ, a town of Sicily, about 32 miles west-south-west of Syracuse. It is situated on a hill, and has well-built, regular streets. Wine of good quality is produced in the district. Pop. about 9000.

CHIA'RI, a town of Lombardy, 14 miles west of Brescia, on the railway between that place and Milan. It is an ancient place, many Roman remains being still found here; and at one time it was strongly fortified, but its walls are now ruinous. Silk is the staple manufacture. Pop. 10,000.

CHIAR-OSCU'RO (Ital.), an artistic term composed of two Italian words, one signifying light, the other darkness or shadow. But C. neither signifies light nor shadow; neither is it described by saying that it is the art of disposing of both the lights and shadows in a picture, so long as either is regarded apart from the other. It is rather *the art of representing light in shadow and shadow in light*, so that the parts represented in shadow shall still have the clearness and warmth of those in light, and those in light the depth and softness of those in shadow. It is not the making of the one die softly and gradually away into the other, but the preservation of both in combination, as we constantly see it in nature, when the light is not the mere glare of the sun striking on a particular object, nor the shadow the entire absence of the influence of light. That the skilful treatment of C. is a matter of extreme difficulty, is plain enough from the very small number of artists who ever attain to it. Still, it is a branch of art without the mastery of which no painting can be successful in any department. It is as indispensable in portrait-painting as in the highest department of ideal art; and though a just and even a lofty conception of the subject may be distinctly indicated by attention to form alone, it is impossible that its realization can ever be satisfactorily accomplished by any one who has not mastered this most subtle mode of handling colors. The only mode by which a knowledge of C. can be attained, so as to apply it to practice, is by studying it as exhibited by such painters as Titian, Rubens, Rembrandt, and, above all, Correggio.

CHIAVA'RI, a maritime town of Piedmont, situated on the Gulf of Rapallo, at the mouth of the Sturla, 21 miles east-south-east of Genoa. The houses in general are well built, with open arcades skirting the narrow streets. C. has several fine churches, the principal of which is the *Madonna del' Orto*. Numerous picturesque old towers, one of them of considerable size, are scattered over the town. Lace and silk are manufactured here; and the place is also noted for its light, handsome, cheap furniture, made chiefly of cherry-wood. The anchovy fishery is important; and in the vicinity are extensive slate-quarries. Pop. 10,457.—The old province of C., of which the above town was the capital, had an area of 155 square miles, with a population of 109,000. Its surface is generally mountainous, but it has valleys of great fertility, yielding grain, grapes, olives, &c. Cattle, sheep, goats, and silkworms are reared.

CHIAVE'NNA, a town of Lombardy, beautifully situated in the midst of vineyards, at the junction of the valley of St. Giacomo and Val Bregaglia, 38 miles north-north-west of Bergamo. It is overlooked by the Rhetian Alps; and its position on the Spügen road secures it considerable traffic. Silk, cotton, and a coarse ware cut out of a soft stone found in the neighborhood, are the chief manufactures. Pop. about 4000.

CHICA, a red feculent substance, valuable as a dye-stuff, giving an orange-red color to cotton. It is obtained by boiling the leaves of a species of *Bignonia* (*B. Chica*), a native of the banks of the Cassiquiare and the Orinoco. The Indians use it for painting their bodies. The C. plant is a climber, with abruptly bipinnate leaves, smooth heart-shaped leaflets, and flowers in pendulous axillary panicles. See BIGNONIACEÆ.

CHICA, PITO, POSO, or MAIZE BEER, is a fermented liquor made from maize or Indian corn. It is much used in some parts of South America, and is made in a similar manner to ordinary beer; but the Indians sometimes prepare by chewing instead of crushing the grains; and that which is so prepared (*Chica mascada*, or chewed C.) is most highly esteemed by them. When they wish to make this liquor particularly strong and well flavored, they have also a practice of pouring it into an earthen jar, which contains some pounds of beef; and having made the jar perfectly air-tight, they bury it several feet deep in the ground, where it is left for several years. On the birth of a child, it is their custom thus to bury a jar of C., to be drunk at the same child's marriage. C. has an agreeable flavor, and is very strong and intoxicating. A spiritous liquor is obtained from it by distillation; vinegar is also made from it.

CHICACO'LE, a town of the district of Ganjam, in the presidency of Madras, being in lat. 18° 18′ N., and long. 83° 58′ E., and lying 415 miles to the south-west of Calcutta, and 435 to the north-east of Madras. It stands on the left or north bank of the Naglaudee, not far from the Bay of Bengal. It is a military station, and contains, besides its garrison, (1871) 15,587 native inhabitants. The place has a reputation for its richly worked muslins.

CHICA'GO (pronounced *She-kaw-go*), the principal city of Illinois, and seat of Cook county, is situated on the south-western shore of Lake Michigan, at the mouth of the Chicago River, lat. 41° 50′ 20″ N., long. 87° 37′ W. The name is of Indian origin, signifying 'wild onion,' and is first mentioned by Perrot, a Frenchman, by whom it was visited in 1671. In 1803, a stockade fort was erected near the mouth of the river, and named Fort Dearborn. When the war with Great Britain broke out in 1812, the government, apprehensive that a post among the Indians so far from the frontiers could not be successfully maintained, ordered the commander to abandon it.

The Indians destroyed the fort, which was rebuilt in 1816. C. was first settled in 1831, previous to which time it was a mere frontier-post; in 1832, it contained about a dozen families, besides the officers and soldiers in Fort Dearborn. The town was organized by the election of a Board of Trustees, August 10, 1833. In September 26 of the same year, a treaty was made for all their lands with the Pottawatomies, 7000 of the tribe being present, after which they were removed west of the Mississippi River. The first charter of the city was passed by the legislature March 4, 1837. The following table exhibits the rapid increase of Chicago. The estimated number of the population in 1835 was 1000, and the exact number, according to the census returns, was, in

1840	4,470	1855	83,509
1845	12,080	1860	150,000
1848	20,035	1865	187,446
1850	28,260	1870	298,977
1852	38,733	1875	410 000
1853	60,652	1880	503,304

C., perhaps the most remarkable city in the world for its rapid growth, is built upon a plain sufficiently elevated to prevent inundation. Some years ago, the elevation of the principal streets, also the buildings, were raised from 4 to 10 feet, the object of this gigantic undertaking being to admit of a thorough system of sewerage. The Chicago River and its branches separate the city into three divisions, connected by large tunnels. The main stream, flowing directly west, is about 100 yards wide, and forms one of the best harbors on the lakes. Vessels ascend the river and its branches a distance of 4 miles from its mouth, thus affording nearly 18 miles of wharfage. The water for the city is now supplied by a tunnel from Lake Michigan, which was opened in 1867, and supplies 57,000,000 gallons daily. There are also about 40 artesian wells. C. possesses a splendid system of public parks,

and numerous handsome buildings. More than 30 railways meet here.

The Illinois and Michigan Canal, completed in 1848, connects the Chicago and Illinois rivers, thus affording communication between the lakes and Mississippi to the coal-fields of Illinois, and to the vast quarries of so-called Athens marble, regarded as the finest building-material in the country. It is found on the banks of the canal, about 20 miles from C.; and is easily worked when first quarried, like the Caen stone.

The 36 public schools of C.—some capable of holding 1000 children—afford the means of education, free of charge, to every child in the city. There are also numerous private schools and seminaries, besides several colleges, medical, theological, literary, and scientific institutions.

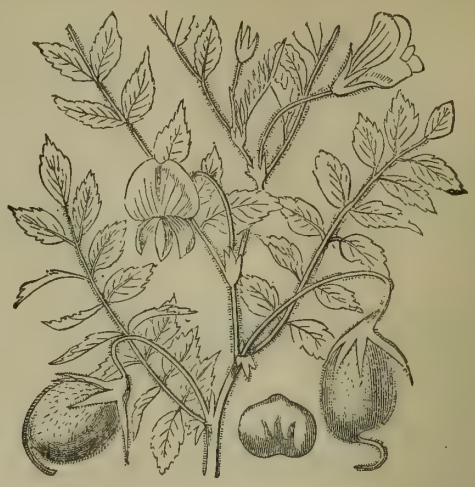
Since 1853, pork-packing has been conducted on an enormous scale. In 1872, 1,456,650 hogs were packed as pork; in the year 1880, 5,375,000 hogs were slaughtered. The packing-houses can now prepare about 100,000 a day, and about 65,000 cattle. Since 1854, C. has been the largest primary grain-dépôt in the world. In 1872, 88,426,842 bushels of bread-stuffs were received. The grain received in 1880 amounted to 161 million bushels. C. is also the most extensive lumber market in the world. There are 80 newspapers and periodicals, while upwards of a million books, manufactured in C., were distributed during 1880. The debt of C. was 12,794,271 dollars in 1880.

In October 1871, a terrible fire occurred, which burned 18,000 houses, extending over more than 2000 acres; 200 persons perished, and nearly 100,000 were rendered homeless. The property burned was estimated at 200,000,000 dollars. This stupendous calamity awakened the practical sympathy of the civilized world. The city was entirely rebuilt in a style of great magnificence within two years. Another fire in 1874 did damage to the amount of 4,000,000 dollars.

CHICH'EN, a town of Central America, in the north-east of the peninsula of Yucatan, which separates the Gulf of Mexico from the Caribbean Sea, 18 miles to the south-west of Valladolid. It is one of the principal towns of the state, and is worthy of notice chiefly for the remains of an ancient city, comprising a ruined temple 450 feet long, a pyramid with a base of 550 feet square, and a domed edifice ornamented with sculpture.

CHI'CHESTER, a municipial and parliamentary borough and episcopal city in Sussex, 17½ miles east-north-east of Portsmouth. It stands on a plain between an arm of the sea and the South Downs, which rise gently on the north. It is well built and has wide streets. The two main streets cross at right angles, and meet in an elaborately worked eight-sided cross. Within the suburbs the city is surrounded by an ancient wall, 1½ mile in circuit, with some semicircular bastions, and now a promenade under the shade of elms. The cathedral, erected in the 12th and 13th centuries, on the site af a wooden one founded 1108, and burned 1114, measures 410 by 227 feet, with a spire 300 feet high. The aisles are double—a mode of construction to be seen nowhere else in Britain. The cathedral has a rich choir, and portraits of the English sovereigns from the Conquest to George I., and of the bishops down to the Reformation. The chief trade is in agricultural produce and live-stock. There are malting, brewing, and tanning establishments. Pop. (1881) 9652. C. returns one member to parliament. The harbor, 2 miles to the south-west of the city, is a deep inlet of the English Channel of about 8 square miles; has several creeks and Thorney Isle; and is connected with C by a canal. C. was the Roman *Regnum*, and has afforded Roman remains—as a mosaic pavement, coins, urns, and an inscription of the dedication of a temple to Neptune and Minerva. C. was taken and partly destroyed, in 491, by the South Saxons. It was soon after rebuilt by Cissa, their king, and called Cissancaster, or Cissa's Camp. It was for some time the capital of the kingdom of Sussex. In 1642, the royalists of C. surrendered to the parliamentarians, after a siege of ten days.

CHICK PEA (*Cicer*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having pinnate leaves; solitary, axillary, stalked flowers; and two-seeded pods, inflated like bladders. The common C. P. (*C. arietinum*) grows wild in the cornfields of the countries around the Mediterranean Sea, and in many parts of the east. It is an annual, 1½—2 feet high, of a stiff upright habit, covered with glandular hairs. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, curiously wrinkled, so that they have been thought to resemble a ram's (*arietis*) head. They are used as food, either boiled or roasted, and are the most common *parched pulse* of the East. They are an important article of French cookery. They have been in general use from the earliest times, and the plant is extensively cultivated in Egypt Syria, India, the south of Europe, &c. Its cultivation extends as far north as the southern parts of Germany; but in the climate of Britain it is found too tender to be a profitable crop. It is the *Gram* of India, and the *Garvance* of the French, whence the English name *Caravances*. The herbage affords a nutritious food for cattle, and the seeds are one of the occasional substitutes for coffee. In great summer heats, drops



Chick Pea (*Cicer arietinum*).

exude from this plant, which, on drying, leave crystals of almost pure oxalic acid.

CHI'CKEN-POX, a contagious febrile disease, chiefly of children, and bearing some resemblance to a very mild form of small-pox (q. v.). C. is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any permanent mark or pit, as in small-pox. From its vesicular character, it has been called the *crystal pock*. It has bean argued that C. is, in fact, only small-pox modified by previous vaccination; but this opinion, though maintained on good authority, is not generally received by medical men. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long.

CHI'CKWEED (*Stellaria media*), one of the most common weeds of gardens and cultivated fields, is a species of STITCHWORT (q. v.). It is a native of most parts of Europe and of Asia, appearing during the colder months even on the plains of India; an annual, with a weak procumbent stem and ovate leaves, very variable; some of the smaller varieties in dry sunny situations sometimes puzzling young botanists, from having only five or three instead of ten stamens; but always characterized by having the stem curiously marked with a line of hairs, which at each pair of leaves changes from one side to another, and in four changes completes the circuit of the stem. The leaves of C. afford a fine instance of the *sleep of plants*, closing up on the young shoots at night. C. is a good substitute for spinach or greens, although generally little regarded except as a troublesome weed, or gathered only by the poor to make poultices, for which it is very useful, or for feeding cage-birds, which are very fond both of its leaves and seeds. A number of species of a nearly allied genus, *Cerastium*, natives of Britain, also bear the name of C., or MOUSE-EAR C., and the name is occasionally given to other plants, either botanically allied, or of somewhat similar appearance.

Chickweed (*Stellaria media*): *a*, branch with leaves and flowers, reduced; *b*, a flower; *c*, parts of fructification.

CHICLA'NA, a pretty town of Andalusia, Spain, 12 miles S.E. of Cadiz. It manufactures linen, earthenware, and brandy. The mineral baths are much frequented. Pop. (1877) 11,677.

CHICOPEE, formerly CABOTSVILLE, and including Chicopee Falls, a manufacturing town of Massachusetts, U. S., on the left

bank of Connecticut River, at the mouth of Chicopee River, 5½ miles north of Springfield. Chicopee Falls supplies water-power to numerous cotton and woollen factories, paper-mills, brass cannon and bell foundries, and the Ames Manufacturing Company, which makes machinery, swords, bronze cannon, statues, &c. C. has 10 churches and several newspapers. Pop. (1880) 11,325.

Chicory Root.

CHI'CORY, or SU'CCORY (*Cichorium*), a genus of plants of the natural order *Compositæ*, sub-order *Cichoraceæ*, distinguished by bracts in two unequal rows, the outer always reflexed, the inner latterly becoming so, a nearly naked receptacle, obovate striated achenia, and a pappus of two rows of minute scales. The species are few in number, herbaceous plants, full of milky juice, natives chiefly of the warmer temperate regions of the eastern hemisphere. The common C. or SUCCORY (*C. Intybus*) is a perennial plant, found wild in England and most parts of Europe, growing in waysides, borders of fields, &c. It has a long carrot-like root, externally of a dirty or brownish yellow color, and white within. The stem rises to the height of 2—5 feet, branching, the leaves are *runcinate*, resembling those of the dandelion; the flowers sessile, axillary, in pairs, rather large, beautiful, generally blue, more rarely pink or white. C. is pretty extensively cultivated, both in England and on the continent of Europe for its roots. It is also cultivated for feeding cattle with its leaves. The blanched leaves are sometimes used as a salad, and they are readily procured in the winter by placing the roots in a box with a little earth in a cellar.—To this genus belongs also the ENDIVE (q. v.).

C. has been used as a substitute for coffee, or to mix with coffee, for at least a century. The roots are pulled up, washed, cut into small pieces, and dried on a kiln, which leaves a shrivelled mass not more than one-fourth the weight of the original root. It is then roasted in heated iron cylinders, which are kept revolving as in coffee-roasting, during which it loses about 25 to 30 per cent. of its weight, and evolves at the same time a disagreeable odor, resembling burned gingerbread. An improvement to the C. during roasting is the addition of 2 lbs. of lard or butter for every cwt. of C., which communicates to it much of the lustre and general appearance of coffee. It is then hand-picked, to remove chips of wood, stones, &c., and is reduced to powder, and sold separately as *C. powder* or *C. coffee*, or is added to ordinary ground-coffee, and is sold as a mixture. C. contains a good deal of sugar, but otherwise does not serve to supply the animal economy with any useful ingredient. It gives off a deep brown color to water, when an infusion is made, and hence its main use in coffee. Some people dislike the taste of C., and when largely used, it has a tendency to produce diarrhœa; but many people prefer to use coffee mixed with C. owing partly to the taste it communicates, but mainly to the appearance of strength which it gives to the coffee. The C. is liable to adulteration; and roasted beans, pease, carrots, parsnips, mangold-wurzel, acorns, horse-chestnuts, biscuit, oak-bark tan, logwood and mahogany dust, and even the livers of horses and bullocks, are said to be employed in its adulteration.

Chicory.

CHIEF, in Heraldry, an ordinary formed by a horizontal line, and occupying the upper part of the escutcheon. Like the other honorable ordinaries, the C. ought properly to take up a third part of the shield; but when the other charges are numerous, the C. is frequently diminished in size.—Any object borne in the upper or chief part of the shield is said to be *in chief*, though the C. be not divided off from the rest of the field, as a separate portion.—*On a Chief:* Is when the object is represented on the C., divided off as above described.

In Chief.

CHIEF-JUSTICE. See JUSTICE, LORD CHIEF.

CHIE'M-SEE, a lake of Upper Bavaria, the largest in the country, lies about 42 miles south-east of Munich. It is situated at an elevation of more than 1600 feet above the sea; its length is 12 miles, with a breadth of 9, and its greatest depth 500 feet. Its shape is irregular, and its coast much indented. It has three islands; the Achen and Prien flow into it, and its surplus water is discharged by the Alz into the Inn. The C. is famous for its fish; and a small steamer which plies on it, enables travelers to view its fine scenery.

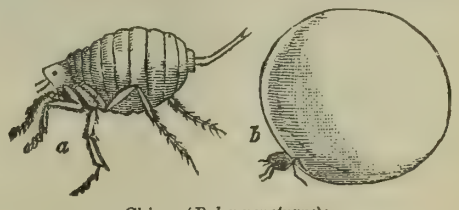
CHIE'RI, a town of Piedmont, Northern Italy, situated on the slope of a hill 9 miles south-east of Turin. C. is an ancient place. By the later Romans it was called Carea. The church of St. Dominico, built in 1260, has some good paintings; and that of Santa Maria della Scala, built in 1405, is one of the largest Gothic structures in Piedmont. C. is one of the oldest manufacturing towns in Europe, its manufacture of fustians and cotton stuffs dating from 1422. Silk, cotton, and linen are still important manufactures. Pop. 9000.

CHIE'TI, an archiepiscopal city of Italy, capital of the province of the same name, is situated on a hill near the Pescara, about 100 miles north of Naples. It is a well-built and flourishing place, with some imposing public edifices, including a cathedral, lyceum, and theater; and its agreeable situation has made it the residence of numerous wealthy families. The district around is fertile and well cultivated, and in the city, the cloth and silk manufactures afford employment for a considerable number of people. Pop. 15,000. C. is a very old place, being built on the site of the ancient *Teate* of the Romans, many of the remains of which are still visible. In the year 1524, St. Gaetano founded here the order of the Theatines.

CHIFF-CHAFF (*Sylvia hippolais*), a small species of warbler, very widely diffused, being found both in England and in the neighborhood of Calcutta. It is common in the south of Europe, is in Britain a summer bird of passage, arriving, however, very early in spring, and does not extend northward into Scotland. Its general color is brown; the under parts lighter. It is a very sprightly little bird; but its song consists merely of a frequent repetition of two notes resembling the syllables chiff-chaff. It is also called the Lesser Pettychaps.

CHIGNE'CTO BAY, the more westerly of the two inlets at the head or north end of the Bay of Fundy, in British North America. It separates Nova Scotia from New Brunswick, is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of St. Lawrence.

CHI'GOE, or (JI'GGER (*Pulex*, or *Sarcopsylla penetrans*), a species of Flea (q. v.), rather smaller than a common flea, and with less powerful limbs, found in the West Indies and South America, where it is excessively troublesome, attacking any exposed part of the human body, and effecting a lodgment between



Chigoe (*Pulex penetrans*):
a, male; *b*, gravid female.

the skin and flesh, often under the skin of the foot or the nails of the toes. At first, its presence is indicated only by a slight itching or tingling; but an ulceration is likely soon to be the result, which is not only very painful, but even dangerous, when the female C. is allowed to remain and to deposit her numerous eggs.

Before these are deposited, her abdomen becomes distended in an extraordinary manner, as a membraneous bag, to the size of a pea. The ulcer speedily contains a great colony of chigoes. The negresses of the West Indies are very expert in extracting the C., which is also removed by washing with tobacco-juice. Rubbing with tobacco-leaves is also employed as a preventive of its attacks.

CHIH-LE, or PECHIH-LE, one of the northern provinces of China, and the most important of the 18, as being the center of government, and containing Pekin, the imperial capital, the residence of the emperor and court. Pop. about 28,000,000; area, 58,949 square miles.

CHIHUA'HUA, a city of the Mexican confederation, with 12,000 inhabitants, and a considerable trade between Santa Fé, in New Mexico, and the United States. It is in lat. 28° 40′ N., and long. 105° 33′ W., and has a cathedral, convents, and an aqueduct

3 miles long, besides appropriate buildings, as the capital of the state of its own name. The territory in question, stretching in lat. from 27° to 32° N., and in long. from 104° to 108° 40′ W., is divided from Texas, in the United States, by the Rio Bravo del Norte. It is a table-land, more remarkable for mineral resources than for agricultural productions. It abounds in nitre and other salts, and is rich in mines of gold and silver. Pop. 180,000.

CHI'LBLAINS. See CHAPPED HANDS.

CHILD, SIR JOSIAH, an eminent London merchant, and one of the ablest of the earlier English writers on commerce and political economy, born in 1630, was the second son of Richard Child, a merchant of London. His principal work is entitled, *Brief Observations concerning Trade and the Interest of Money* (Lond. 1668, 4to); a 2d edition, much enlarged, entitled *A New Discourse of Trade*, was published in 1690. In this work he explains his plans for the relief and employment of the poor, including the substitutions of districts or unions for parishes, and the compulsory transportation of paupers to the colonies. He was one of the directors, and for some time chairman of the East India Company, and is said to have written several tracts in defence of the trade to the East Indies, which were published anonymously. In 1678 he was created a baronet, and died in 1699.

CHI'LDERMAS, or HOLY INNOCENTS' DAY (28th December), is observed by the Church of Rome with masses for the children killed by Herod. It was considered unlucky to marry or to begin any work on this day. From Fenn's *Letters* (vol. i. p. 234) we learn that the coronation of King Edward IV. was put off till the Monday, because the preceding Sunday was Childermas Day. C. is also a holiday of the Church of England.

CHILD-KILLING. See INFANTICIDE.

CHILD-STEALING. See ABDUCTION.

CHI'LI, (spelled CHILE by its own subjects), the best governed and most prosperous of the republics of Spanish origin in South America, occupies the southern strip of the continent to the west of the Andes, with the adjoining islands. Till of late, C. was separated from Peru by a Bolivian coast territory. Since the war of 1879–80, C. has annexed this district (including the desert of Atacama), and insists on keeping the southernmost Peruvian province, Tarapaca (16,000 sq. miles, with 42,000 inhabitants). C. no longer claims any interest in Tierra del Fuego, or in the south of Patagonia (as for many years it did), and has made a treaty to that effect with the Argentine Republic. Within the nominal limits of C., however, lies the virtually independent Araucania (q. v.) comprising most of the mainland south of the Biobio; while the southern settlements are confined chiefly to Chiloe (q. v.) and its archipelago. Three new southern provinces have lately been organized; till of late there were but 16 provinces, and these had an area of 130,000 sq. m. The population was given by the census of 1875 at 2,075,971, but about 10 per cent. was supposed to be omitted from this, and 50,000 Indians were not reckoned at all. In 1880, the pop. was estimated at 2,300,000. As contrasted with the rest of Spanish America, C. contains an unusually large proportion of European blood. The most remarkable aboriginal race are the Indians of Araucania (q. v.). Santiago is the capital of C.; Valparaiso the chief port.

The constitution is nominally republican, but has been hitherto substantially a dictatorship. The state has nevertheless maintained a degree of peace and prosperity unknown to the other commonwealths of kindred race. The president is elected, indirectly, for five years. He chooses a council of fifteen, removable at his pleasure. The legislature consists of a senate and 37 members elected for six years, and a chamber of deputies, elected for three years, in the proportion of one for every 20,000 inhabitants. The elections are usually controlled by the government, as the electors are mostly members of the national guard, and hold offices dependent on the president.

The revenue of the republic in 1880 was £3,286,000, and the expenditure £3,075,061. The debt in 1880 was £14,916,410, including £7,000,000 for railways. The total value of imports in 1879 was £4,559,076, the exports being valued at £8,531,567—chiefly copper, silver, wool, wheat, tallow, hides, and jerked beef. Most of the trade is with Great Britain—the imports thence being mainly cottons, woollens, and articles of iron. The manufactures are not extensive, but include hempen cloth, cordage, soap, leather, earthenware, charcoal, flour, brandy, and coarse metal-work. C. has about 1000 miles of railway lines. A line across the Andes to Buenos Ayres has been projected. The army, during the war in 1879–80 with Peru, comprised 20,000 men, besides a national guard raised to 30,000 men The navy, which took an important part in the war, consisted in 1879 of 10 small steamers, and two large and powerful ironclads.

The constitution, adopted in 1810, was modified in 1833. The most serious attempt at revolution occurred in 1851. The Araucanians have repeatedly given C. much trouble, but are now nominally subject to the republic. In 1864, C. gave Peru very valuable support in her war with Spain, and took a large share in the deciding final engagement. A dispute had been going on between C. and Bolivia as to the possession of Atacama desert on the seaboard towards the Peruvian frontier. In 1879 Chili declared war with Bolivia, with which Peru was allied. For a time the Peruvian fleet was victorious, but gradually the Chilians obtained the mastery both by sea and by land. Peruvian armies were defeated; Peruvian towns were bombarded (including Callao); and the chief war-ships of Peru taken; and in 1881 the Chilians occupied Lima and Callao, and were in a position to dictate the terms of peace.

History.—Immediately after the conquest of Peru, C. was seized by Almagro, a companion of Pizarro, subsequently becoming the seat of a captain-generalship, which held sway as far as Cape Horn. In 1810 commenced the war of independence, which, at the close of eight years, was decided against Spain by the victory of Maypu.

Geology.—The predominant rocks of C. are crystalline and metamorphic. They form the range of the Andes, except in those districts in which active volcanoes exist, where they are covered with recent volcanic rocks. They occupy also the whole of the level ground between the mountain-range and the shores of the Pacific, with the exception of a narrow stretch of palæozoic fossiliferous strata which run along the coast south from Santiago for a distance of 300 miles. The coast-line of C. is being continually altered from the elevation of the whole country to an extent of at least 1200 miles along the Pacific shores, produced by volcanic agency. In 1822, the coast was raised 4 feet at Quintero, and 3 feet at Valparaiso. Oysters and other mollusks were left dry, and perished, becoming offensive as they decomposed. The change of level was permanent, over an area of 100,000 square miles, nearly as large as the whole extent of Great Britain and Ireland. A similar extensive elevation was noticed in 1835 by Captain Fitzroy.

Physically, the continental portion of the republic—for its insular section will, in this respect, be noticed under the head of CHILOE—presents many singularities. Of all the maritime regions on the globe, it is perhaps the most isolated. On every side but the sea—and that sea very remote from the main thoroughfares of commerce—it is beset by difficulties of communication. With the lonely wilderness of Patagonia to the south, and the dreary desert of Atacama on the north, it is bounded on the east by a mountain-chain which, altogether impracticable in winter, can be crossed, even in summer, only by a few passes ranging between 12,450 feet and 14,370 in elevation. Moreover, this strip between the Andes and the Pacific is broken into plateaus in the interior, and valleys on the coast, by two longitudinal ranges, with numerous lateral spurs; while, throughout the length and breadth, the general level gradually descends, as well to the south as to the west.

In point of mere temperature, so rugged a surface—covering fully 15° of latitude, and attaining an altitude of more than four miles within about 2° of longitude—must present nearly every possible variety. Through the reciprocal action of the Andes (q. v.) and the prevailing winds, the rain-fall graduates itself, with something of mathematical regularity, from the parching skies of the north to the drenching clouds of the south—a graduation which, disturbed merely by the melting of the mountain-snows, is, in a great measure, necessarily reflected in the condition and magnitude of the countless water-courses. Hence the rivers to the north of the Maypo, which enters the Pacific near latitude 34°, are but inconsiderable streams; while, further to the south, the Maule, the Biobio, and the Calacalla are all to some extent navigable.

From the cause last mentioned, different districts vary remarkably in their productions. To the north of the Coquimbo, about lat. 30°, is chiefly an arid waste, redeemed, however, from being valueless by its mines; and to the south of the Biobio, about lat. 37°, timber and pasturage divide the soil between them. The intermediate center alone is fitted for agriculture, yielding, besides maize and hemp, European grains and fruits in abundance. Notwithstanding all the varieties and viscissitudes of climate, the country may claim to be, on the whole, extremely healthy. The Chilians are more enterprising than the inhabitants of the other South American republics. Their agriculture, though primitive, is favored by a singularly fertile soil. Enormous herds of cattle are kept. The merchants often amass considerable wealth. Roman Catholicism is the prevailing religion; but other faiths are protected by a law of 1875. Education is as yet very little extended, but of late much has been done to promote it; there are more than 500 government schools, besides monastic, municipal, and private schools. There is a kind of university at Santiago.

CHILI, or CHILLI. See CAPSICUM.

CHILI NETTLE. See LOASACEÆ.

CHILI SALTPETRE is a commercial name applied to the nitrate of soda. See SODA, NITRATE.

CHILLIANWA'LLA, a village of the Punjab, being five miles from the left or east bank of the Jhelum, the most westerly of the five rivers which give name to the country. It is in lat. 32° 40′ N., and long. 73° 39′ E., being 85 miles to the north-west of Lahore. C. claims notice as the scene of Lord Gough's dearly won victory, over the Sikhs, of January 1849, and also as the site of an obelisk erected to the memory of those who fell in the two Sikh wars.

CHILLICO'THÉ, or CHILICOTHE, a city of Ohio, U. S., beautifully situated on the right bank of the Scioto River, 45 miles from its confluence with the Ohio, and the same distance south of Columbus, on the Cincinnati and Marietta Railway, and Ohio and Erie Canal; has 13 churches, 3 banks, court-house, foundries, engine and implement factories, &c. Founded in 1796, and former capital of the state. Pop. (1870) 8920; (1880) 10,938.

CHILLINGWORTH, WILLIAM, a famous theologian of the Church of England, was born at Oxford 1602, and educated at Trinity College in that university, where the arguments of a Jesuit named Fisher induced him to become a Roman Catholic. He withdrew to Douay; but was induced by his god-father, Dr. Laud, then Bishop of London, to re-examine the whole controversy between Catholics and Protestants, and in 1631, he returned to the bosom of the Anglican Church. Four years later, he published a work, entitled *The Religion of Protestants a Safe Way to Salvation*. It was exceedingly keen, ingenious, and conclusive in point of argument. C. was perhaps the ablest disputant of his age; and had there not been a certain fickleness and want of solidity about his intellect, and a nervous suspicion that all human reasoning might be vitiated by undiscovered fallacies, he might have produced a really great work. *The Religion of Protestants* acquired a wide popularity. C. was offered much church preferment, which he at first refused—having certain scruples in regard to the subscription of the 39 Articles—but afterwards accepted. He became Chancellor of the Church of Sarum, and prebendary of Brixworth, in Northamptonshire. He was a strong royalist, and on the breaking out of the civil war, accompanied the king's forces. He died January 1644. The best edition of *The Religion of Protestants* appeared in 1742, with sermons, &c., and a life of the author, by Dr. Birch.

CHILLON, a celebrated castle and fortress of Switzerland, in the canton of Vaud, 6 miles south-east of Vevay. It is situated at the east end of the Lake of Geneva, on an isolated rock, almost entirely surrounded by deep water, and is connected with the shore by a wooden bridge. The castle is said to have been built in 1238, by Amadeus IV. of Savoy, and it long served as a state prison. It is famous as the prison of Bonnivard, the prior of St. Victor, who having, by his efforts to free the Genevese, rendered himself obnoxious to the Duke of Savoy, was carried off by emissaries of that potentate, and confined here for six years, at the end of which time the castle had to surrender to the Bernese and Genevese, when Bonnivard was liberated. C. has been immortalized by Byron's *Prisoner of Chillon*. The castle is now used as a magazine for military stores.

CHILOE′, the insular province of Chili (q. v.), is an archipelago on the west side of South America, which takes its name from its principal island. It is separated from the rest of the republic, or rather from Patagonia, by the Gulf of Ancud, extending in S. lat. from 41° 40′ to 43° 20′, and in W. long. from 73° to 74°. The province—which, in 1875, numbered 64,536 inhabitants—contains, in addition to C. Proper about 60 islets, of which about 30 are uninhabited. In the archipelago are two towns, both of them seaports of C. Proper—Castro, the ancient capital, on the east coast; and San Carlos, the modern seat of government, towards the north-west extremity. The atmosphere, like that of the mainland opposite, is excessively moist; the westerly winds, more particularly in winter, bringing almost constant rain. The climate, however, is on the whole healthy. This fact is the more remarkable inasmuch as C. Proper is one natural forest, measuring 100 miles by 40, with a partially cleared and cultivated margin on the sea. The chief products are wheat, barley, potatoes, apples, and strawberries; and cattle, sheep, and pigs are reared in considerable numbers. Agriculture, however, is in a very primitive state; and the staple food of many consists of mussels and oysters. The population, equally indolent and poor, differs from that of the rest of Chili in the great preponderance of aboriginal blood. Schools are numerous; but, from the ignorance of the teachers, education has not made satisfactory progress. The principal manufacture is a coarse woollen cloth, dyed blue. This Archipelago was discovered by the Spaniards as late as 1558; and as it was the last integral portion of Spanish America to be colonized, so also was it the last to throw off the mother-country's yoke.

CHILOGNA'THA AND CHILO'PODA. See MYRIAPODA.

CHI'LTERN HILLS, the south part of the low chalk range which runs north-east, about 70 miles, from the north bend of the Thames, in Oxfordshire, through Bucks and the borders of Herts and Beds, and ends in Norfolk and Suffolk. In Oxford, Herts, and Beds, the C. H. are 15 to 20 miles broad, and the highest points are Wendover, 905 feet; and Whitehouse, 893.

CHILTERN HUNDREDS. In former times, the beech-forests which covered the Chiltern Hills, in Buckinghamshire, were infested with robbers, and in order to restrain them, and protect the peaceable inhabitants of the neighborhood from their inroads, it was usual for the crown to appoint an officer, who was called the Steward of the Chiltern Hundreds. The office, which has long ceased to serve its primary, now serves a secondary purpose. A member of the House of Commons cannot resign his seat unless disqualified either by the acceptance of a place of honor and profit under the crown, or by some other cause. Now, the stewardship of the C. H. is held to be such a place, and it is consequently applied for by, and granted, in the general case as a matter of course, to any member who wishes to resign.

As soon as it is obtained, it is again resigned, and is thus generally vacant when required for the purpose in question. When the C. H. are not vacant, however, the same purpose is served by the steward-ship of the manors of East Hendred, Northshead, and Hempholme. As to the offices which are held to vacate seats, see ELECTION. 'The practice of granting the Chiltern Hundreds for the purpose above described began only about the year 1750, and its strict legality has been doubted, on the ground that the stewardship is not an office of the kind requisite to vacate a seat. The gift of the Chiltern Hundreds lies with the Chancellor of the Exchequer, and there is at least one instance of its being refused. In 1842, after very awkward disclosures had been made before a committee of the House of Commons, as to corrupt compromises, which had been entered into for the purpose of avoiding investigation into gross bribery in the election to certain boroughs, of which Reading was one, the member for Reading applied for the stewardship of the Chiltern Hundreds, and was refused—the Chancellor of the Exchequer being of opinion that, by granting it, he would in some sort have made himself a party to transactions which he did not approve, and of which the House of Commons had implied its condemnation.'—*Standard Library of Political Knowledge*, p. 500.

CHIMÆ′RA, a genus of cartilaginous fishes, ranked by Cuvier with the Sturgeons (*Sturionidæ*), but now generally regarded as the type of a distinct family, of which only two or three species are known. The gills have a single wide opening, as in the sturgeons; but the gill lid or *operculum* is merely rudimental, and concealed in the skin, whilst there is an approach to sharks in the

Chimæra Monstrosa.

structure of the gills. The only known species of C. is *C. monstrosa*, occasionally found in the British seas, and more common in more northern latitudes. It is sometimes called the *King of the Herrings*. It pursues the shoals of herrings, and is consequently sometimes taken in herring-nets. It is seldom more than three feet long. Its general color is silvery white, the upper parts mottled with brown. It produces very large leathery eggs.

CHIMÆRA, a mythical monster, described by Homer as having a lion's head, a goat's body, and the tail of a dragon. The rationalistic account of C. is, that it represented a mountain in Lycia whose top was the resort of lions, its middle of goats, and the marshy ground at the bottom of which abounded with serpents. In the same manner, Bellerophon's (q. v.) victory over the C. is explained by saying, that he first made his residence on this mountain. The myth seems, at all events, to have belonged to Asia Minor, as gigantic carvings of the C. on rocks are there found. It is usually represented as a lion, out of the back of which grows the head and neck of a goat.—C. is used figuratively to denote any monstrous or impossible conception, the unnatural birth of the fancy. It is frequently depicted on shields, as a heraldic charge.

CHIMA'PHILA. See WINTER-GREEN.

CHIMBORA'ÇO, a conical peak of the Andes, in Quito, 21,510 feet above the sea, but only about 12,000 above the level of its own table-land. It is capped with perpetual snow, and was long regarded as the loftiest mountain in the world. Latterly, however, it has been ascertained to be overtopped by some peaks, not merely of the Himalayas, but even of the central division of its own chain. The summit was for the first time reached by Stübel in 1872. Whymper ascended twice in 1880, and found that there was a large glacier on Chimboraço.

CHIME'RE, 'the upper robe worn by a bishop, to which the lawn-sleeves are now generally attached.' Since the time of Queen Elizabeth, it has been of black satin, but previously it was of a scarlet color, like that worn by the bishops when assembled in convocation, and when the sovereign attends parliament.

CHIMES, music performed on bells in a church tower, either by the hands of a performer or by mechanism. The most perfect C. are to be found in Holland and Belgium.

CHI'MNEY (Fr. *cheminée*, Lat. *caminus*). There seems to be reason to believe that the C., in its present sense of a funnel from the hearth or fireplace to the roof of the house, is a modern invention. In Greek houses it is supposed that there were no chimneys, and that the smoke escaped through a hole in the roof. What the arrangement was in houses in which there was an upper story, is not known; perhaps the smoke was conveyed by a short funnel through the side-wall of the house, which seems to have been the first form of C. invented in the middle ages. The Roman *caminus*, again, was not a C., but a sort of stove; and it has been a subject of much dispute, whether the Romans had any artificial mode of carrying off the smoke, or whether it was allowed to escape through the doors, windows, and openings in the roof. As the climate and the habits of the people both led to the houses of the ancients being very much more open than ours are, it is probable that the occasional fires which they had of wood or charcoal may have given them no great inconvenience. It is known, besides, that the rooms in Roman houses were frequently heated by means of hot air, which was brought in pipes from a furnace below. In England, there is no evidence of the use of C.-shafts earlier than the 12th century.

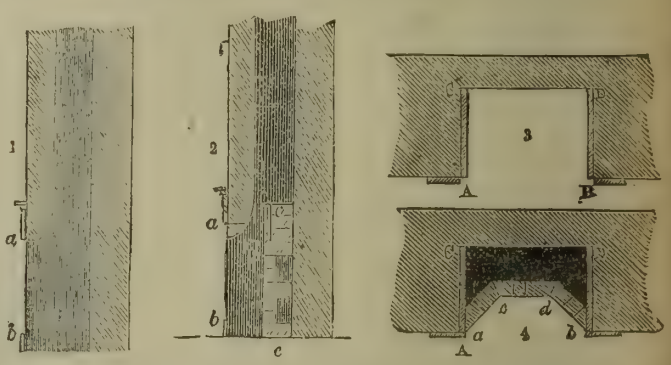
In Rochester Castle (*circa* 1130), complete fireplaces appear; but the flues go only a few feet up in the thickness of the wall, and are then turned out through the wall to the back of the fireplace, the openings being small oblong holes. The earliest C.-shafts are circular, and of considerable height. Afterwards, chimneys are found in a great variety of forms. Previous to the 16th c., many of them are short, and terminated by a spire or pinnacle, having apertures of various shapes. These apertures are sometimes in the pinnacle, sometimes under it, the smoke escaping as from some modern manufacturing C.-stalks which are built in the form of an Egyptian obelisk. Clustered C.-stalks do not appear until late in the 15th c., when they seem to have been introduced simultaneously with the use of brick for this purpose. Each of the earlier clustered chimneys consists of two flues which adhere to each other, and are not set separate, as afterwards was the practice. Long after they were invented, and in use for other rooms, our ancestors did not generally introduce them into their halls, which, till the end of the 15th, or beginning of the 16th c., continued as formerly to be heated by a fire on an open hearth in the center of the hall, the smoke escaping through an opening in the roof known by the name of *louvre*. In many of the older halls in which chimneys exist, they have evidently been inserted about this period.

Tisbury, Wilts: From Parker's *Glossary*.

The action of a C. depends upon the simple principle, that a column of heated air is lighter than a cooler column of equal height; when therefore a flue full of heated air communicates freely by the lower part with the cooler air around it, the greater weight of the latter pushes the warm air upwards, and thus an ascending current is produced. Other conditions being equal, the draught of a C. will thus be proportional to its perpendicular height, and the difference between the temperature within and without it. The straighter and more perpendicular the C., the stronger will be the draught, because the friction of the ascending current will be less, and the cooling effect of a long or tortuous course will be saved. The maximum efficiency of a given C. is attained when all the air that passes up enters by the bottom of the fire. In this case, its temperature is raised to the uttermost by passing through the whole of the fire, and the fire is at the same time urged to vivid combustion by the blast thus obtained. A powerful furnace may be constructed by connecting a suitable fireplace, capable of being closed all round excepting at the bottom, with a tall C.; and the amount of draught may be regulated by increasing or diminishing the aperture through which the air is admitted to the bottom of the fireplace, or by an adjustable opening above the fireplace, which will diminish the effective draught as its size is increased, or by a combination of both of these contrivances.

When the fireplace can be enclosed thus, there is little liability to descending currents or 'smoky chimneys,' as they are called, even when the C. is very short, or has a tortuous course. It is chiefly with open fireplaces that this defect occurs, and the means of prevention and cure is a subject of some interest and importance. As with most other evils, the prevention is far easier than the cure; for by properly constructing the C. in accordance with the principles above stated—by placing the opening of the C. as nearly over the fire, and contracting the open space above the fire, as much as possible—downward smoking may in most cases be easily prevented. When a C. is in the neighborhood of a wall or building nearly as high as itself, or—what is still worse—higher, it is apt to smoke on account of the eddies and other complex currents in the air, caused by the interference which such an obstacle presents to the regular movement of the wind. In towns, such tortuous movements of the atmosphere are very common, and the contrivances for preventing the wind from blowing down the chimneys are very numerous, and often grotesque. Revolving cowls of various forms, but alike in having a nearly horizontal outlet, which is so turned by the wind that the mouth shall always point in the direction opposite to that whence the wind is blowing, are the most common, and usually the most effectual. They are generally constructed of sheet-zinc, with an arrow, a flattened pigeon, or other device, as a vane, to determine the rotation of the cowl. The curing of smoky chimneys, in conjunction with the economizing of fuel, was one of the favorite subjects of investigation of that very practical philosopher, Count Rumford. He says: 'Those who will take the trouble to consider the nature and properties of elastic fluids—of air, smoke and vapor—and to examine the laws of their motions, and the necessary consequences of their being rarefied by heat, will perceive that it would be as much a miracle if smoke should not rise in a chimney—all hindrances to its ascent being removed—as that water should refuse to run in a siphon, or to descend a river. The whole mystery, therefore, of curing smoky chimneys is comprised in this simple direction: find out and remove those local hindrances which forcibly prevent the smoke from following its natural tendency to go up the chimney; or rather, to speak more accurately, which prevent its being forced up by the pressure of the heavier air of the room.'* He then goes on to speak of above 500 smoking chimneys that he has had under his hands, and which were supposed incurable, and states that he was never obliged, 'except in one single instance, to have recourse to any other method of cure than merely reducing the fireplace and throat of the chimney, or that part of it which lies immediately above the fireplace, to a proper form and just dimensions.'

The figures illustrate his method of proceeding. Fig. 1 is a side view of a vertical section of a C. and fireplace before alteration; fig. 2, the same after the reduction of the fireplace and throat of



chimney. *ab* is the opening of the fireplace in both; this is lowered by the piece at *a*, fig. 2, and the depth diminished by the brickwork, *ce*, behind; *cd* is a movable tile, to make room for the C.-sweeper. Figs. 3 and 4 are plans of the fireplace, looking down upon the hearth: the original opening of the fireplace is shown by ACDB, fig. 3; the contracted opening, by *acdb*, in fig. 4. The dark space is filled with rubbish and faced with brick-work.

The slope of *ac* and *bd*, fig. 4, is better adapted for radiation into the room than the square opening of fig. 3: the fire being brought further forward, has also more heating effect; the space of the fireplace being smaller, the air within it will with a given sized fire become hotter, and therefore have more ascending power; while in the contracted throat widening downwards, and having its sides

* *Essays: Political, Economical, and Philosophical*, by Benjamin Count Rumford, vol. i. p. 299.

strongly heated, there is a rapid rush of heated air, which carries the smoke upwards, and resists the passage of temporary down-draughts. Most modern chimneys and fireplaces are now constructed in accordance with Count Rumford's suggestions. See GRATE.

One frequent cause of smoky chimneys is the want of sufficient inlet for air to the room. Sandbags placed under doors, and other devices for preventing ventilation, may cause a well-constructed C. to smoke. Openings must exist somewhere, of sufficient capacity to supply the air which is to ascend the chimney. If the air enters the room on the same side as the fireplace, a temporary descending current is likely to be produced. The openings are best opposite the fire. For the methods of arranging and regulating such openings for the admission of air, see VENTILATION.

Tall factory-chimneys, usually built of brick, are very costly structures, many of them rivaling in height our loftiest cathedral spires. Their construction has been considerably economized by building from the inside, and thus saving the expensive scaffolding. Their walls are built very thick at the base, and gradually thinner upwards: recesses are left at regular intervals in the inside, and stout wooden or iron bars rest upon these to form a sort of temporary ladder for the workmen to ascend; the materials are hoisted by ropes and pulleys.

Sheet-iron chimneys are largely used in Belgium. They are much cheaper but less durable than brick, and are objectionable on account of their rapid cooling by the action of the external air.

CHIMPA'NZEE (*Troglodytes niger*), a species of ape; one of those which in form and structure exhibit the greatest resemblance to man. It is a native of the warmest parts of Africa; to which also the Gorilla (q. v.), a larger species of the same genus, belongs. The C. is sometimes called the black Orang; but differs from the Orang (q. v.) (*Pithecus*) of Asia in the proportionally shorter arms, which, however, are much longer than those of man; in the possession of an additional dorsal vertebra, and an additional or thirteenth pair of ribs; and in other particulars, in some of which it more nearly resembles, and in others more widely differs, from

Chimpanzee.

the human species. In both, the difference from man is very wide in the general adaptation of the structure for movement on all fours and for climbing and moving about among branches, rather than for erect walking, although the C. is able to move in an erect posture more easily than any other ape, usually however, when so doing, holding its thighs with its hands; and still more in the form of the skull, and consequent aspect of the countenance, the facial angle being as low as 35° in the C. when it is measured without regard to the high bony ridges which project above the eyes; the jaws excessively projecting, and the outline of the face rather concave. There is also an important difference from the human species in the dentition; although the number of teeth of each kind is the same, the canine teeth of the apes is elongated, so as to pass each other, and corresponding intervals are provided for them in the opposite jaw. An interesting point of difference of the anatomy of the C. and Orang from that of man, is in the muscle which in man terminates in a single tendon, and concentrates its action on the great toe, terminating in the apes in three tendons, none of which is connected with the great toe or hinder thumb, but which flex the three middle toes; part of the adaptation of the foot for clasping as a hand. The great toe both of the C. and Orang is shorter than the other toes, and opposed to them as a thumb.

The C. does not seem to attain a height of quite four feet when in an erect posture. Its skin is thinly covered with long black hair in front; the hair is thicker on the head, back, and limbs. The ears are remarkably prominent, thin, and naked, not unlike human ears in shape. The nose appears as little more than a mere wrinkle of the skin. The thumb of the hand is small and weak, that of the foot comparatively large and powerful. In a wild state, the animal appears to be gregarious, but its habits are not well known. Truth and fable have been so mixed up in the accounts of it, that new information must be obtained from reliable sources before even things not in themselves very improbable can be believed. In a state of confinement, it exhibits, at least when young, considerable gentleness and docility, and readily learns to imitate human actions, in eating with a spoon, drinking out of a glass, and the like; but its intelligence does not appear to be superior to that of many other monkeys, or indeed of many kinds of brutes. Its natural food consists chiefly of fruit and other vegetable substances; in confinement, it exhibits a great fondness for sweetmeats and for wine. The C. is impatient of cold, and the climate of Britain soon proves fatal to it.

CHINA. See CHINESE EMPIRE.

CHINA, or CHINA-WARE. See PORCELAIN.

CHINA BARK, a name of Cinchona (q. v,) Bark, often to be met in books, and in common use on the continent. It is derived, not from the empire of China, but from *Kina* or *Quina*, the Peruvian name of cinchona.

CHINA CLAY, or KA'OLIN. See CLAY.

CHINANDE'GA, a town of Central America, Nicaragua, stands in a fertile plain at the foot of some mountains, about 18 miles north-west of Leon, and about ten miles from the Pacific coast. The houses are straggling, of one story, built of adobes, and many of them are enclosed by gardens and plantations. Maize, sugar, cotton, hides, and poultry are produced in the vicinity. Pop. about 10,000.—OLD CHINANDEGA, which is contiguous, has a pop. of about 4000.

CHINA GRASS, or CHINESE GRASS, the popular name of a fibre used in China for the manufacture of a beautiful fabric known as *Grass-cloth*. The name appears to have originated in the belief that the fibre was that of a grass; but this is not the case, it being chiefly obtained from *Bœhmeria* (q. v.) *nivea*, a plant allied to the nettle. Besides this and other species of the natural order *Urticaceæ*, other plants, as species of *Corchorus* (q. v.) and *Sida* (q. v.), are believed to yield fibres employed in the same manufacture. The fibres are said not to be spun after the European manner, but joined into long threads by twisting their ends together. Grass-cloth is now brought in considerable quantity to Europe, especially in the form of pocket-handkerchiefs. It has a fine glossy appearance and a peculiar transparency.

CHINA ROOT, the root, or rather the *rhizome* (root-stock) of *Smilax China*, a climbing shrubby plant, closely allied to sarsaparilla, and belonging to the same genus; a native of China, Cochin-China, and Japan. See SARSAPARILLA and SMILACEÆ. The stem is round and prickly, the leaves thin and roundish oblong; the rhizome tuberous and large; sub-astringent and diaphoretic. It is occasionally used in medicine, and is imported in a dry state into Europe; but it is also employed in the East as an article of food. It abounds in starch.

CHINCHI'LLA, a town of Spain, in the province of Albacete, 10 miles south-east of the city of that name. It is situated on an abrupt rocky hill, crowned by a castle, and is surrounded by walls. The town is in general well built, with good streets, and a fine parish church, containing some excellent works of art. It has manufactures of cloth, linen, leather, earthenware, and glass, and a trade in the agricultural produce of the district. Pop. 7500.

CHINCHILLA (*Chinchilla*, *Eriomys*, or *Callomys*), a genus of South American quadrupeds, of the order *Rodentia;* the type of a family, *Chinchillidæ*, allied to Cavies (*Caviedæ*), but differing from them in possessing clavicles. The general aspect is somewhat rabbit-like. There are several genera of *Chinchillidæ*, distinguished in part by the number of toes; the true chinchillas having four, with the rudiment of a fifth on the fore-feet, and four on the hind-feet; whilst in the genus *Lagidium* or *Lagotis* there are four on each foot; and in *Lagostomus*, four on the fore-feet and three on the hind-feet. All the species of this family are gregarious; feed much on roots, for which their strong and sharp incisors are particularly adapted; and live either in holes, which they select for themselves in rocky districts, or in burrows, which they excavate. They are valued for their fur, particularly the CHINCHILLA of the Andes (*C. lanigera*), of which the fur

Chinchilla.

constitutes an important article of commerce. Their numbers are said to be sensibly decreasing in consequence of the demand for the fur. The ancient Peruvians were accustomed to employ the wool of the C. for the manufacture of fine fabrics. Molina suggests, that it might easily and profitably be kept in a domesticated state.

CHINCHO'N, a town of Spain, in the province of Madrid, 25 miles south-south-east of the city of that name. It is pleasantly situated on a hill near the Tagus. Agriculture forms the chief occupation of the inhabitants. Pop. (1877) 4771. After a Countess of C., wife of the governor of Peru in 1638, Peruvian bark was named *Chinchona*, now habitually misspelled *Cinchona* (q. v.).

CHINDWA'RA, a town in the Central Provinces of India, lat. 22° 3′ N., and long. 78° 58′ E. It occupies a plateau amid the Deoghur Mountains, standing 2100 feet above the level of the sea. Its climate is consequently one of the most agreeable and salubrious in India, attracting many visitors in search of health or recreation. Pop. (1872) 8626.

CHINE, La, a village of the Dominion of Canada, on the south side of the island of Montreal, and about 9 miles to the west of the city of that name. Both the city and the village stand on the left bank of the St. Lawrence, or rather, of a branch of the Ottawa; for here, and at least 10 or 12 miles further down, these united rivers keep their waters unmingled. As the intermediate portion of the stream forms the Rapids of St. Louis, the consequent interruption of the navigation naturally rendered La C. a turning-point between the maritime and the inland communications. Gradually, however, its importance in this respect has been diminished, if not extinguished, by works between it and Montreal—a canal, a railway, and even improvements in the rapids themselves. The pop. in 1871 was 1696.

CHINESE EMPIRE, a vast territory in Eastern Asia, comprehending five great divisions—viz., 1. Mantchuria (q. v.); 2. Mongolia (q. v.); 3. Turkestan (q. v.); 4. Tibet (q. v.); 5. China Proper, or the Eighteen Provinces (*Shih-pa-sang*), including the two large islands of Formosa and Hainan—the former being reckoned in the province of Fuh-keen, and the latter as a department of Kwang-tung.

China Proper occupies the eastern slope of the table-lands of Central Asia. In form it approaches to a square, and covers a surface eighteen times as large as Great Britain. It is inhabited by more than 360 millions of the human race, living under the same government, ruled by the same laws, speaking the same language, studying the same literature, possessing a greater homogeneity, a history extending over a longer period, and a more enduring national existence than any other people, whether of ancient or modern times; indeed, when we consider its high antiquity, its peculiar civilization, its elaborate administrative machinery, its wondrous language, its philosophy and classic literature, its manufacturing industry and natural productions, giving rise to such gigantic commerce with our own land, China is perhaps the most remarkable country in the world, and is worth a closer and more serious study than has yet been generally accorded to it. China Proper is included between 18° and 40° N. lat. (which takes in the island of Hainan), and 98°—124° E. long. Its coast-line exceeds 2500 miles, and the land-frontier 4400 miles. A line running direct north and south would give a length of 1474 miles; and another at right angles to this, 1355 miles; but one drawn diagonally from its north-eastern extremity through Yun-nan would measure 1669 miles. The area of China Proper is usually given at 1,548,000 square miles; other authorities allege that the entire dimensions of the 18 provinces (19 with Sheng-king in Manchuria) cannot be much under 2,000,000 square miles. All these measurements, however, must be taken as mere approximations.

Physical Features.—China has a general slope from the mountains of Tibet to the shores of the Pacific. The two principal mountain-chains divide it into three longitudinal basins, drained by those great rivers for which China is famous. Within its provinces are found alluvial plains, fertile river-valleys, large populous towns, as well as thinly inhabited hilly and mountainous regions. To describe its surface more particularly, it may be viewed under its natural divisions of mountainous country, hilly country, and the Great Plain. The first comprehends more than half the region between the meridian 113° and Tibet. East of this meridian, and to the south of the Yang-tze-kiang river, is the hilly country, which includes the provinces of Fuh-keen, Keang-se, Kwang-tung, and a portion of Hu-nan and Hupih; while to the north-east stretches the Great Plain. This latter extends from the Great Wall to 30° N. lat.: a line drawn from King-chow in Hupih to Hwae-king on the Yellow River, may be considered its western limit; and the sea forms its boundary on the east. This vast and generally fertile tract has an area of 210,000 square miles, and supports a population of 177 millions.

From the mountains of Tibet two grand ranges stretch across China, having a general direction from south-west to north-east. The more northerly of these—the Thsin-ling or Blue Mountains—are included between the parallels of 31° and 34°. The southern or Nan-ling chain is a spur of the Himalayas. Commencing in Yun-nan, it bounds Kwang-se, Kwang-tung, and Fuh-keen on the north, and passing through the province of Che-keang—where some of its peaks reach the height of 12,000 feet—enters the sea at Ning-po; thus forming a continuous barrier—penetrated only by a few steep passes, of which the Mei-kwan, or Mei Pass, is the best known—that separates the coast-land of South-eastern China from the rest of the country. This great chain throws off numerous spurs to the south and east, which, dipping into the sea, rise above it as a belt of rugged islands along the southern half of the Chinese sea-board. Of this belt, the Chusan Archipelago is the most northerly portion.

The magnificent *river-system* of China is represented by those noble twin streams, the Hoang-ho or Yellow River, and the Yang-tze-kiang, which, springing from the same water-shed, the eastern mountains of Tibet, are widely separated in their mid course, but of late entered the sea within 2° of each other. The former has its source in 35½° N. lat., and about 96° E. long.; and after a very tortuous course, now empties itself into the ocean in lat. 38°. (For the changes in its lower course, see the article HWANG-HO.) It is for the most part little adapted for navigation. But the river most beloved by the Chinese is the Yang-tze-kiang (q. v.)—in its upper course called Ta-kiang, or Great River—with a drainage basin of 750,000 square miles. Of the other rivers, the Peiho in the north, and the Choo-keang in the south, are the most noteworthy.

The principal *lakes* of China are five in number—viz., the Tung-ting-hu, in 113° E. long., with a circumference of about 220 miles; the Poyang-hu, in 116° E. long., 90 miles in length and 20 in breadth; the Hung-tsin-hu, in Keang-su; the Tsau-hu, between Ngankin-fu and Nankin; and the Tai-hu, in 120° E. long.

The *Grand Canal* has greatly facilitated the internal navigation of the country. Until lately, the great annual grain-fleet, with its 430,000 tons of rice for the use of the capital, passed from the south to the neighborhood of Pekin by this great water-way; thus avoiding the storms and pirates of the coast, but the alteration already mentioned in the course of the Hoang-ho has rendered it comparatively useless. It connects Tien-tsin in Chih-le with Hang-chow in Che-keang; though the canal proper commences in Shan-tung, and its total length is about 650 miles.

Another world-famous structure is the *Great Wall*, called Wan-li-chang (myriad-mile-wall) by the Chinese. There have been several great walls built against invaders: one in 300 B.C., and a larger one in 214 B.C., but there is no reason to suppose that either corresponds with the present one. In 1368, the pressure of the Mongols first suggested to the emperors of the Ming dynasty the idea of a continuous and comprehensive wall; and at detached periods in successive centuries, the present great wall came into existence. Part of it dates from the period between 1530 and 1620 A.D. (see *Proc. of the Geog. Society*, 1882). It traverses the northern boundary of China, extending from 3½° E. to 15° W. of Pekin, and it is carried over the highest hills, through the deepest valleys, across rivers, and every other natural obstacle. The length of this great barrier is 1259 miles. There are four different kinds of masonry in various parts of it; but the most important portion consists really of two parallel walls of burnt brick, the interval between them being filled up with clay, stone, and brickbats. Including a parapet of 5 feet, the total height of the wall is 20 feet; thickness at the base, 25 feet; and at the top, 15 feet. Towers or bastions occur at intervals of about 100 yards. These are 40 feet square at the base, and 30 feet at the summit, which is 37 feet, and in some instances 48 or 50 feet, from the ground. Earth enclosed in brickwork forms the mass of the wall; but for more than half its length it is little else than a heap of gravel and rubbish.

Geology.—The high lands, where are the sources of the great rivers of China, consist of granitic and metamorphic rocks. These are continued round the south and south-east of the country, until they leave a huge basin, through which flow the Yang-Tze-kiang and Hoang-ho, occupied by fossiliferous strata. The wild and rugged scenery of the larger portion of China is owing to the predominance of those crystalline and sub-crystalline rocks. The fossiliferous strata exhibit representatives of the various formations. The Palæozoic rocks are but sparingly developed in a narrow stripe which runs from near Pekin, in a south-westerly curve, to nearly the center of the empire. Cretaceous rocks occur in the valley of the Yang-tze-kiang. Tertiary beds fill up the eastern portion of the immense basin; while extensive districts to the west of this region, extending to the crystalline rocks in the extreme west, are covered with modern detritus.

Though no active volcanoes are known to exist except one in Formosa, yet indications of volcanic action are not wanting. Salt and hot-water springs are found in Yun-nan; sulphur springs near Foochow; and wells of petroleum in Shen-se and Formosa. The most famous amongst the *minerals* of China is jade or the yu-stone, obtained chiefly in Yun-nan. Coal, limestone, and porcelain clays

are abundant. Precious stones are said to be met with in some districts. In Yun-nan, gold is washed from the sands of the rivers, and in the same province silver-mines are worked; here, too, is obtained the celebrated pe-tung or white copper. All the commoner metals are likewise found in China. Near the city of Ning-po are extensive stone-quarries.

Vegetable Productions.—Our knowledge of the flora of China has been much advanced by the researches of Fortune, Richthofen, and others; and there are now numerous works discussing the geography, culture, and varieties of the tea-plant, and of the botany of the country generally. The tea-plant (*Thea viridis* and *Thea bohea*) is the most important vegetable production of China (see TEA). The tallow-tree (*Stillingia sebifera*) the *Dryandra cordata* or varnish-tree, the camphor-tree (*Laurus Camphora*), the Chinese pine (*Pinus Sinensis*), the Chinese banyan (*Ficus nitida*), the funereal cypress —introduced into this country by Mr. Fortune—and the mulberry, are amongst the most important trees of China. The cocoa-nut and other palms flourish on the southern coast. Of the bamboo, which grows as far north as lat. 38°, there are 63 principal varieties; and it is said that the bamboos of China are more valuable than her mines, and, next to rice and silk, yield the greatest revenue. The various uses to which they are applied is truly astonishing; and, amongst others, the bamboo is famous as an instrument of punishment. The fruits of both the tropical and temperate zones—apples, grapes, pomegranates, mangoes, pine-apples, three species of orange, the lichi, &c.—are found in the country; and camellias, azaleas, and gardenias are natives of the 'Flowery Land.' The *nymphæa*, or water-lily, is greatly prized by the Chinese, both for ornament and in an economical point of view. *Agriculture* is held in higher estimation in China than, perhaps, any other country in the world. On the first day of each year, a grand state-ceremony is performed in its honor. The emperor, accompanied by his great officers of state, repairs to the Sacred Field, and having offered sacrifices on an altar of earth, he traces a furrow with the plough, and his example is followed by princes and ministers. A like solemnity is celebrated by the governor of every province, who represents the emperor. The agricultural system of the Chinese is rude, but effective; and every inch of arable land is carefully cultivated. Spade-husbandry and irrigation are carried on to a great extent.

The Chinese have a strong perception of the value of night-soil as a manure; for, whilst in this country thousands of pounds' worth are annually thrown into the Thames, in China it is everywhere saved, bears a high price, and is collected in a manner exceedingly offensive to European notions. In the northern provinces, the cereals are principally maize, barley, and wheat; but in the south, rice is raised in vast quantities, and forms the staple food of the people. Tobacco and the poppy are also raised in considerable quantities.

Animals.—Very little is really known of the zoology of China. Some of the more ferocious of the carnivorous animals still linger in the jungles of Yun-nan, and are occasionally found along the whole of the Nanling range of mountains as far as Ning-po, where there is a mart for their skins. Wild cats are common in the forests of the south, and bears are still found in the hills of Shan-se. Of the ruminantia, there are the musk deer (*Moschus moschiferus*), the moose-deer, and a few other species. The gold and silver pheasant, the argus pheasant, and other gallinaceous birds, hold a prominent place in the ornithology of China. Fly-catchers, thrushes, grackles, and goat-suckers have their representatives in China, and there are several species of crows, jays, and magpies. Water-fowl inhabit the lakes, rivers, and marshes. The larger reptiles are unknown; but tortoises and turtles abound on the coast, and lizards are plentiful in the south. The ichthyology of China is considered to be one of the richest in the world. Sharks, rays, sturgeons, and other cartilaginous fishes, are common on the coast; and the carp formerly was very plentiful in the lakes and rivers. The goldfish has been introduced into Europe from China. Of insects, the arachnidæ are large and numerous; indeed, a tree-spider captures and kills small birds. Locusts often commit extensive ravages. Silk-worms are highly valued, and reared in large numbers.

In a country of such vast extent—extending from 18° to 45° N. lat.—the *climate* must vary greatly. Indeed, as regards both climate and productions, China may be divided into three zones —the northern, the central, and the southern. The northern zone extends to the 35th parallel, and includes the fine provinces of Shang-tung, Chih-le, Shan-se, Shen-se, and Kan-su. It produces the grains, fruits, and animals of Northern Europe. Here the children are red-cheeked, and the extremes of heat and cold are great. In Chih-le, the winters are very severe; and at that season ice a foot thick renders the rivers unnavigable. The natural productions of this and the contiguous northern provinces are wheat, barley, oats apples, the hazel-nut, and the potato; they are also rich in wood and minerals.

The central zone, the richest portion of China, contains eight provinces—Sze-chuen, Kwei-chow, Hunan, Hupih, Keang-su—and is bounded by the 27th or 28th parallel; tea and silk are its characteristic products; the middle portion is the granery of China, and the eastern part is celebrated for its manufactures of silk and cotton. The southern zone embraces five provinces—Yun-nan, Kwang-tung, Kwang-se, Fuh-keen, and Che-keang. The exchange of its tropical productions for those of the northern zone is an important branch of the internal commerce of the country. Kwang-tung lies partly within the tropics; and the whole province is tropical, both in climate and productions. The following table (no later census has been made) exhibits the situation, area, and population of the eighteen provinces into which China is divided for administrative purposes :

PROVINCES.	Population. Census of 1812.	Sq. Miles.	Pop. per Sq. Mile.
Northern Provinces—			
Chih-le	27,990,871	58,949	475
Shang-tung	28,958,764	65,104	444
Shan-se	14,004,210	55,268	252
Ho-nan	23,037,171	65,104	420
Eastern Provinces—			
Keang-su	37,843,501	44,500	850
Gan-hwuy	34,168,059	48,461	705
Keang-se	23,046,999	72,176	320
Che-keang	26,256,784	39,150	671
Fuh-keen	14,777,410	53,480	276
Central Provinces—			
Hu-pih	27,370,098	70,450	389
Hu-nan	18,652,507	74,320	251
Southern Provinces—			
Kwang-tung	19,174,030	79,456	241
Kwang-se	7,313,895	78,250	93
Yun-nan	5,561,320	107,969	51
Kwei-chow	5,288,219	64,554	82
Western Provinces—			
Shen-se	10,207,256	67,400	153
Kan-su	15,193,125	86,608	175
Sze-chuen	21,435,678	166,880	128
Totals,	360,279,897	1,298,079	277

But, according to the *Almanach de Gotha* for 1880, the population of C., properly so called, was estimated at 405,000,000; and of the rest of the empire, including Mantchuria, Mongolia, Tibet, and Corea, 28,000,000—in all, 433,000,000. After Pekin, the capital, the largest cities in China are Canton, Tien-Tsin, Foochow, Hankow, Hang-chow-Foo, Ning-po, Amoy, Shanghai, &c.

Inhabitants.—The Chinese proper, by far the most numerous race, are the most important of the Mongolo-Tartar stock (to which the other races in the empire also belong). See CHINESE LANGUAGE, WRITING, AND LITERATURE. A tawny or parchment-colored skin, black hair, lank and coarse, a thin beard, oblique eyes, and high cheek-bones, are the principal characteristics of the race. The average height of the Chinaman is about equal to that of the European, though his muscular power is not so great; the women are disproportionately small, and have a broad upper face, low nose, and linear eyes. Of the general character of the Chinese, it is not easy to form a fair and impartial judgment; and those who have resided long in the country, and know them well, have arrived at very different conclusions. M. Huc asserts that they are 'destitute of religious feelings and beliefs,' 'sceptical and indifferent to everything that concerns the moral side of man,' 'their whole lives but materialism put in action;' but 'all this,' says Mr. Meadows, 'is baseless calumny of the higher life of a great portion of the human race.' He admits, indeed, that these charges are true of the mass of the Chinese, just as they are true of the English, French, and Americans; but as amongst these there is a large amount of generosity and right feeling, and also 'a minority higher in nature, actuated by higher motives, aiming at higher aims,' so also, he maintains, is there amongst the Chinese a similar right feeling, and a like minority who live a higher life than the people generally. See HIOUEN-THSANG. As regards valor, their annals record 'deeds akin to the courage of antiquity;' they have no fear of death, commit suicide as the solution of a difficulty, and endure the most cruel tortures with a passive fortitude; but neither their arms nor discipline enable them to stand before European forces. The Chinese are, as a race, unwarlike, fond of peace and domestic order, capable of a high degree of organization and local self-government, sober, industrious, practical, unimaginative, literary, and deeply imbued with the mercantile spirit. It is to be observed that the inhabitants of China Proper are essentially one people; the difference, except in dialect, being hardly more marked than between the Northumbrian peasant and the Cornish miner. The south-eastern Chinese—the people of Kwang-tung, Fuh-keen, and the south of Che-keang—are the most restless and enterprising in all the eighteen provinces of China, and may be regarded as the Anglo-Saxons of Asia. In the mountainous districts of the four south-eastern provinces of China, but principally in Kwang-se, are certain tribes who maintain a rude independence, wear a

peculiar dress, and are descended from the aboriginal inhabitants of China. Of these, the Meaon-tze are the best known.

The *manners and customs* of the Chinese can only here be glanced at. The *worship of ancestors* is a remarkable and prominent feature in their social life, and is dictated by that principle of filial piety which forms the basis of Chinese society. The rich have in their houses a chamber—a kind of domestic sanctuary—dedicated to their forefathers. Tablets, representing the deceased persons, and inscribed with their names, are here carefully preserved; and at stated seasons, prostrations and ceremonies are performed before them according to the Book of Rites. All Chinese worship from time to time at the tombs of their parents. In everything that relates to death and sepulture, the customs of the Chinese are no less singular. They meet their last enemy with apparent unconcern; but whilst their future state troubles them little, they regard the quality of their coffins as of vital importance, and frequently provide them during their lifetime; indeed, a coffin is reckoned a most acceptable present, and is frequently given by children to their parents. 'To be happy on earth,' say the Chinese, 'one must be born in Su-chow, live in Canton, and die in Lianchau' —Su-chow being celebrated for the beauty of its women, Canton for its luxury, and Lianchau for furnishing the best wood for coffins. Yet death is never alluded to in direct terms, but indicated rather by periphrases, such as—the person 'exists no more,' 'he has saluted the age,' 'ascended to the sky,' &c. Bauquets are offered to the dead, and pathetic speeches addressed to them. In China, *marriage* is universal, and within the reach of all; but there is a strict separation of the sexes, and bethrothal is undertaken by the parents or by professional match-makers. Minute ceremonial observations regulate every step, and frequently the bride and bridegroom see each other on the wedding-day for the first time. Women hold a very inferior position, and are little better than slaves. Polygamy is not recognized by law, but secondary wives are common, especially when the first proves barren.

Chinese (Marriage) Match-makers.

Infanticide, though regarded as a crime, is undoubtedly practised to some extent, as is proved by edits issued against it; and parents possess almost unlimited authority over their children. The intercourse of the Chinese with each other, especially of the upper classes, is regulated by a tedious and elaborate etiquette; indeed, they are the slaves of custom, and everything is done by precedent. Many curious instances of Chinese politeness might be cited. The well-bred host presses many things on a visitor, which the latter must never dream of accepting. 'A Chinaman,' says Mr. Oliphant, 'has wonderful command of feature; he generally looks most pleased when he has least reason to be so, and maintains an expression of imperturbable politeness and amiability, when he is secretly regretting devoutly that he cannot bastinade you to death.' The *Le-king*, or Book of Rites, regulates Chinese manners, and is one cause of their unchangeableness; for here they are stereotyped, and handed down from age to age. The ceremonial usages of China have been estimated at 3000; and one of the tribunals at Pekin—the Board of Rites—is charged with their interpretation. Chinese cookery, in the use of made dishes, more nearly resembles the French than the English. Birds'-nests soup, sharks' fins, deer-sinews, and ducks' tongues, are amongst its delicacies. The wine, or weak spirit (*tsew*), more correctly speaking, used by the Chinese is made from rice; and from this, again, they distil a stronger spirit, the 'samshoo' of Canton. The former is drunk warm in minute cups at their meals; tea never appears during a repast, though it may be taken before or after. The Chinese have numerous *festivals;* and perhaps the most remarkable of these is that celebrated at the commencement of the new year, when unbounded festivity prevails. Preparatory to this, debts are settled, and the devout repair to the temples to gain the favor of the gods. The first day of the year may, in one sense, be reckoned the birthday of the whole people, for their ages are dated from it. Visiting is, at the same time, carried on to a great extent, whilst parents and teachers receive the prostrations and salutations of their children or pupils. The festival of the dragon-boats is held on the fifth day of the fifth month; and at the first full moon of the year, the feast of lanterns. In the manufacture of these the Chinese excel; and on the night of the festival, lanterns illuminate each door, wonderful in their variety of form and material.

In the matter of *dress*, the Chinaman exhibits his usual practical sense, and varies the material according to the season, from cotton-wadded or fur-lined coats to the slightest silk gauze, or grass-cloth. On the approach of cold weather, he lights no fire in his dwelling, but puts on additional clothing until the desired temperature is attained. A tunic, or kind of loose jacket fitting close round the neck, and a wide short trouser, are his principal garments. Shoes are made of silk or cotton, with thick felt soles. White is the color of mourning.

The Tartar tonsure and braided queue became general with the Mantchu conquest of the country, since which 180 millions of men have the hair removed from their heads at short intervals; and as no Chinaman is his own barber, a great number of this calling find employment. The Chinaman is very sparing in his ablutions, and appears to be afflicted with a strange hydrophobia; for cold water, either as a beverage or for washing his person, he holds in abomination. Long nails are fashionable. The costume of the women differs but little from that of the men, and their shoes are the most remarkable part of their toilet. A lady's shoe measures about 3½ inches from the heel to the toe. The feet of the Tartar women are left as nature made them; but amongst the Chinese, all young girls of the better classes are crippled by a tyrant custom. In early infancy the feet are tightly bound, the four small toes being tucked under the sole, of which, after a time, they become a part, and the heel is brought forward. The process is at length complete; stumps have been substituted for the ordinary pedal extremities, and the Chinese lady totters on her goat's feet.

The principal *manufactures* of the Chinese are silk, cotton, linen, and pottery, for which latter they are especially celebrated. The finest porcelain is made in the province of Keang-se. The Chinese invented printing in the beginning of the 10th c., and in 932 A.D. a printed imperial edition of the sacred books was published. The skill of the Chinese in handicraft is astonishing. Their rich silks and satins, light gauzes, beautiful embroidery, elaborate engraving on wood and stone, delicate filigree-work in gold and silver, carvings on ivory, fine lacquered ware, antique vessels in bronze, and their brilliant coloring on the famous pith paper, command our admiration.

Of the grand modern discoveries in the *physical sciences* the Chinese are profoundly ignorant, and the study of nature is altogether neglected. The Chinaman objects to be wiser than his forefathers, but spends a lifetime in studying his classical literature and the sages of antiquity; and here is doubtless one great cause of the homogeneity of the race, and the stereotyped nature of the Chinese mind.

Of *animal physiology and medicine* the Chinese have very crude notions, as is shown by their *scheme* of the human body, in which the heart is placed in the center, with the other organs ranged round it, and their unphilosophical theory of the pulse, which plainly demonstrates that they are ignorant of the true circulation of the blood, and the vascular system in man; hence their practice of medicine must be empirical. Chinese physicians believe that man is composed of five elements; that so long as each maintains its due proportion, health is preserved; but should one gain the ascendancy, illness follows, and the equilibrium must be restored by proper remedies. Acupuncture is practised. The Chinese have had the opportunity of practically testing the superiority of Western medical science, by the establishment of English and American hospitals, by the establishment of a university with foreign professors at Pekin, and by extensive translations of scientific works into Chinese.

In vol. xxiv. of *Nature* (1881) will be found an interesting account of the progress of science in China by means of the translations made under the authority of the department for the translation of foreign books at the Kiangnan Arsenal, Shanghai. Up to 1881, 98 works (mostly scientific) in 236 volumes had been published, and upwards of 30,000 copies of these works (83,500 volumes) had been sold.

Government.—In the centralized autocratic government of China, the emperor is absolute in the empire, the governor in the province, the magistrate in the district. The emperor claims no *hereditary* divine right, and is not always the eldest son of the preceding monarch; the ablest son is nominated, but his right to the throne as the *Teen-tze*, or *Tien-tze*, 'son of heaven,' the *Fung-tien*, 'divinely appointed,' can only be established by good government, in accordance with the principles laid down in the national sacred books. If, on the contrary, he violates these principles, the people firmly believe that heaven signifies, by unmistakable signs, that their ruler is not its chosen representative. 'The rivers rise from their beds, the ground sullenly refuses its fruits, the plains tremble, the hills reel, and the typhoon rages over seas and coasts, all like uttering a "Numbered, numbered, weighed and parted," that requires no interpretation, but is read in anxiety by the people, in dismay and terror by the prince,' who seeks by repentance, and a return to the true principles of the government, to avert his doom. The emperor is absolute as legislator and administrator; but he must legislate in accordance

with the general principles acknowledged in the country. He also constitutes, in his own person, the highest criminal court. The Chinese possess a carefully digested code of laws, which is added to and modified from time to time by imperial edicts. Their penal code commenced 2000 years ago, and copies of it are sold at so cheap a rate as to be within reach of people of the humblest means. Death, which the Chinaman prefers to long confinement, is the penalty for a large number of offences, and in ordinary years about 10,000 criminals are executed. Several modes of torture are legal. The emperor is assisted in governing by two councils—1. *The Inner or Privy Council*, composed of six high officials, three of whom are Chinese and three Mantchus.

The four senior ministers exercise functions corresponding to those of an English prime-minister. 2. *The General or Strategical Council*, which closely resembles our cabinet; being composed of the most influential officers in the capital, who exercise high legislative and executive duties. Under these are six *yamuns* or colleges of government, each charged with a distinct department of government. Over all is the Court of General Inspection, or the *Censorate*, as it is called by foreigners. The mandarins composing this number from 40 to 50; they are 'the eyes and ears of the emperor;' for it is their province to see that all officers of the government, provincial or metropolitan, are faithful in the discharge of their respective duties; and they alone have the right to make representations or complaints to the emperor.

The *administrative machinery* of the Chinese is very perfect in its organization, and demands an attentive consideration for the right understanding of the people and government. In each of the 18 provinces is an imperial delegate or governor, who, besides being at the head of the civil jurisdiction, is commander-in-chief, and possesses the power of life and death for certain capital offences. He is privileged to correspond with the cabinet-council and the emperor. Under the governor are the Superintendent of Provincial Finances, the Provincial Criminal Judge, and the Provincial Educational Examiner; each communicates with his especial board in Pekin. The governor is also assisted by many other judicial and administrative officials. The governmental organization of each province is complete in itself, but in a few instances two provinces—Kwang-tung and Kwang-se, for instance—form a viceroyalty, over which a governor-general, in addition to the governors, exercises authority. Every province is again subdivided into districts, departments, and circuits. The average number of districts in a province is eighty, and each of these is about the size of an English county. A civil functionary, called sometimes the district-magistrate, presides over this division, and is assisted by several subordinate officers. A group of districts—six is the average number for the whole 18 provinces—forms a department, and is ruled by a prefect, who resides in the *fu* or departmental city. Three departments, on an average, constitute a circuit, of which an intendant (Taou-tae) has the charge.

The several grades of mandarins, or Chinese government officials (Chinese name, *kwan-fu*), are distinguished chiefly by a different-colored ball or button on the top of the cap. There are twelve orders of nobility confined to the imperial house and clan, and also five ancient orders of nobility open to the civil and military servants of the state. The normal government of China is less a despotism than a morally supported autocracy, and it is in principle paternal. What the father is to his family, that the governor, the prefect, and the magistrate are intended to be, each in his own sphere, to the people; whilst the emperor stands in the same relation to the myriad inhabitants of his vast dominions. In ordinary times, the Chinaman enjoys much practical freedom, and can travel through the country without passport, or follow any calling he likes.

The Chinese executive system is based on those noteworthy *competitive examinations*, which are intended to sift out from the millions of educated Chinese the best and ablest for the public service. The first examination takes place every three years in the capital of each department, when the lowest degree—that of bachelor—is conferred on a certain number of candidates from each district. Triennial examinations are held in the provincial capital, presided over by two examiners from Pekin, at which sometimes as many as 10,000 bachelors present themselves, and compete for the degree of licentiate. Some 1200 obtain it, and these may attend the triennial metropolitan examination at Pekin, when about 200 may hope for the coveted degree of doctor, which insures immediate preferment.

Much has been written by English authors on Chinese government. Mr. Meadows, from whose works the foregoing sketch of the administrative system of the country has been chiefly derived, has entered very fully into what may be termed the *philosophy of Chinese government*, which he sums up in the following doctrines, and believes them to be deductible from the classic literature of the country, and the true causes of the wonderful duration of the Chinese empire. 1. That the nation must be governed by moral agency, in preference to physical force. 2. That the services of the wisest and ablest men in the nation are indispensable to its good government. 3. That the people have the right to depose a sovereign who, either from active wickedness or vicious indolence, gives cause to oppressive and tyrannical rule. And to these he adds an institution—the system of public-service competitive examinations. But, on the other hand, these examinations, by directing the attention of students solely to the ancient literature of the country, to the exclusion of the physical sciences and inductive philosophy, however efficient in producing that wonderful homogeneity for which the inhabitants of the Central Kingdom are famous, stunt and stereotype the national mind, which, like the dwarfed tree the Chinaman delights to raise in a flower-pot, or the feet of a Chinese girl, can never fully expand.

Education, as the high road to official employment, to rank, wealth, and influence, is eagerly sought by all classes. Literary proficiency commands everywhere respect and consideration, and primary instruction penetrates to the remotest villages. Self-supporting day-schools are universal throughout the country, and the

Collectors of Paper Scraps.

office of teacher is followed by a great number of the *literati*. Government provides state-examiners, but does not otherwise assist in the education of the people. The Chinese have a remarkable reverence for the written character. Waste printed paper is collected from house to house and burned, to preserve it from profanation.

Army.—According to the *Pekin Gazette*, China has a prodigious army, but in reality the greater part figures only on paper. Each province is provided with a military force varying from 8000 to about 68,000 men. According to good authorities, the average for each province is about 34,500 men, and 640 officers. The governor of a province is also commander-in-chief, and is assisted by a general-in-chief, as well as lieutenants and majors general. The Chinese and Tartar troops form two important divisions of the army. The Tartar garrisons are indeed the real strength of the Mantchu emperor. That at Pekin is 150,000 strong; and 18 others, averaging each about 3000 men, are dotted about the provinces, forming, with their wives and children, military colonies. These troops, which are armed with good two-edged swords, and serviceable matchlocks, or the national bow, were able to stand against the victorious Tae-ping rebels, and turn them from the capital. But since 1860, large bodies of Chinese troops have been armed and drilled after the European manner, American, French, and British officers having devoted their energies in succession to this work. Arsenals have been established, and all kinds of fire-arms are successfully manufactured. Foreign breech-loading rifles, Krupp's ordnance, and other weapons have been imported. In the prospect of a possible war with Russia about Kuldja in 1881, the Chinese government undertook a reorganization of the army, which the difficulty with France about Tonquin stimulated. Formerly, the army was said to be composed of 678 companies of Mantchus, 100 men in each; 211 companies of Mongols; 106,000 Chinese cavalry; 500,000 Chinese infantry, besides irregular militia. Now there is (1) the army of Manchuria, 30,000 men; (2) of Mongolia, 20,000; (3) of Turkestan, 40,000. Another army (4) of 100,000 defends the coast; and one (5) of 100,000 protects Pekin—in all, an effective army of 300,000 men, which in war would be raised to about 1,000,000.

Navy.—The imperial navy is divided into river and sea-going vessels. The former amount, it is said, to 1900 ships; the latter, 918—with an aggregate number of 188,000 sailors. This force, however, is insufficient to extirpate or even keep in check the pirates who infest the whole coast of China, and the expedient was formerly resorted to of promoting a pirate chief to some high and civil employment. Even yet he is sometimes appointed pilot. The Chinese are now building frigates on their own account—another evidence of the stride taken under the regency of Prince Kung.

Revenue.—The estimates of the public revenue of China vary greatly, and while they are stated by some to exceed 100 million sterling, are held by others not to come up to half that amount.

Official returns of the Chinese government—intended for a special use—were published in 1844, according to which the revenue amounted to £63,934,713, derived mainly from three sources—customs duties, licenses, and a tax upon land.

Religion.—The Chinese, remarkable in so many ways, exhibit, in the matter of religion, their usual eccentricity. Three forms of belief—the Confucian, the Buddhist, and the Taouist—may be considered the national religions, as they are believed in, more or less, by the great mass of the people. Of these, the Confucian and the Taouist are indigenous, but Buddhism was introduced from India. A struggle for ascendency was long maintained between these religions, but has now entirely ceased; indeed, it is no unusual thing for all three to be professed by the same person, and as they supplement each other, this is not altogether inconsistent. Confucianism is the basis of the social life and political system of the Chinese. It has been professed by all their greatest men, and is still the sole belief of the educated classes. It is, however, less a religion than a philosophy, and does not pretend to treat of spiritual things; hence room was left for other creeds to supply its deficiencies in this respect. The questions to which Confucius replied were: 'How shall I do my duty to my neighbor? How can I best discharge the duty of a virtuous citizen?' Funereal temples are erected to Confucius, and though his image is not used as an idol, his tablet is worshiped, and sacrifices of oxen and sheep are offered before it at the vernal and autumnal equinoxes. For an account of Confucius's philosophy, see CONFUCIUS.

Buddhism in China, though extending over the whole country and influencing more or less the mass of the people, is fast losing its hold on them and has very little of the power and authority it once possessed. Its edifices are going to decay, and no new ones rise upon their ruins. Its priests are illiterate, and together with their religion, are held in contempt by the philosophic Chinaman. Aged people and women are now its chief devotees. The accompanying sketch of the begging-monk (taken, as well as all the other cuts, from Cobbold's *Pictures of the Chinese by Themselves*) is characteristic. He wears a loose yellow robe and large stockings; at his back is a wallet in which to receive the contributions of the faithful; and he gives notice of his approach by striking his *muh-yu*, as represented in the illustration. The northern form of Buddhism, which differs considerably from that of Ceylon and the Indo-Chinese Peninsula, prevails in China. Its sacred books, in common with those of Nepaul and Tibet are written in Sanscrit, or are translations from that language. Amongst other additions to the creed are the Western Paradise and the Goddess of Mercy.

Chinese Buddhist Monk.

Taouism has not more hold than Buddhism on the literate Chinese. Its priests are generally ignorant men, few of them teaching or understanding the real principles of their faith. They practice a mystic alchemy, prepare spells and incantations, and, like modern spiritualists, hold intercourse with the dead. When all other remedies have failed with a sick person, the Taouist priests are sometimes sent for to exorcise the evil spirit that is supposed to afflict the patient; and they chant prayers from their mystic ritual, amid the din of gongs, drums, flutes, &c. These mystics worship certain stars, which are supposed to influence human life, and also genii, devils, and inferior spirits. They live in temples with their families, and are known by their slate-colored robes. For a fuller account of Taouism and its doctrines and founder, see LAO-TSE.

Besides these three religions, which alone affect the bulk of the people, there is a *ritual state worship*, which regards the emperor and court alone—a kind of philosophic pantheism, an adoration of certain natural objects; but it is a mere ceremonial, and associated with no theological doctrines. Three classes of objects are distinguished, to which the great, medium, and lesser sacrifices are offered. The first class includes the heaven and the earth. Equal to these, and likewise restricted to the worship of the emperor, is the great Temple of Imperial Ancestors. The medium sacrifices are offered to the sun and moon, the gods of the land and rain, genii, and sages. In the third class are reckoned certain natural phenomena, as well as deceased statesmen and scholars. The emperor appears to acknowledge a Supreme Being as king of kings, the rewarder of virtue and the punisher of vice; but still, Chinese philosophy, as fixed by Chu-tze, is atheistical, and deduces 'the development of the universe from one unintelligent and will-less principle.' Hence all educated Chinese are atheists, at least theoretically, as will be found by arguing with them; but when they speak of human affairs generally, and their own particular lot in life, they exhibit a belief in *Teen* as a supreme, intelligent, rewarding, and punishing power. There are besides some 30,000,000 of Mohammedans within the limits of the empire.

Between the followers of the three national religions there is not only a total absence of persecution and bitter feeling, but a very great indifference as to which of them a man may belong. It arises probably from religious apathy; preferable to the fanat-

Chinese Taouist Priest exorcising.

ical zeal of the Moslem. Amongst the politer classes, when strangers meet, the question is asked: 'To what sublime religion do you belong?' and each one pronounces a eulogium, not on his own religion, but on that professed by the others, and concludes with the oft-repeated formula: 'Religions are many; reason is one; we are all brothers.' The government is equally tolerant of religious diversity, except where a political design is suspected.

Temples belonging to the three religions are very numerous. Those dedicated to Confucius are funereal in character. The Buddhist temples are crowded with images, and Buddha is represented expounding his doctrine to attentive listeners. The many-storied tower takes the place of the bellshaped dagoba or relic-shrine of other Buddhist countries.

History and British Intercourse.—The early annals of China, like those of most other countries, belong rather to mythology than to history. Beginning with Pan-ku, the first of all beings, the country was ruled over first by gods, and then god-descended personages, who revealed to men the essential arts of life. Of those mythical rulers the most famous is Fo-hi. The historical period may be said to commence with the Hia period or dynasty, begun by Yu the Great about 2200 B.C., although a great infusion of the fabulous still continues. Some date the real history of China from the Tchow or Chow dynasty, which began with Wu-wang about 1100 B.C. It was during the reign of Ling-wang (571—544), one of this dynasty, that Confucius was born.

China would seem during this period to have been divided into a number of independent states. The kings of Tsin gradually gained the ascendency, and at last one of them reduced the other states to subjection (247 B.C.), and assumed the title of Hoang, or emperor. It is from the Tsin dynasty that the country has taken its name, Tsina or China. This first emperor finished the Great Wall (see above), as a protection against the Tartars, who had all along under the name of Hiong-nu (Huns), been a source of danger and annoyance to the richer and more pacific Chinese. We cannot enumerate the various dynasties that followed, nor the frequent divisions and reunions of the empire, varied by incursions and partial subjugations by the troublesome Tartars. At last, the Mongols or Western Tartars, being called in to aid the Chinese (1209), became finally (see KUBLAI KHAN) masters of the whole country (1279), and reigned over it till 1368, when they were expelled by the Chinese, and the Ming native dynasty succeeded, which lasted 276 years, and fell at length through its own misgovernment. A general of the last Ming emperor, who was employed in keeping the Mantchus (q. v.) in check, made peace with them, and obtained their assistance against the native usurper who had deposed his sovereign. The Mantchus established themselves in Pekin (1644), and finally, after a seven-years' struggle, acquired the sovereignty of the whole empire. Many of the conquering race now filled the highest offices of state, and owed their position to birth alone. More than one powerful emperor of the race has ably conducted the government of the country; but Hien Fung, who ruled from 1850 to 1861, was reported to have passed his time in a state of drunken imbecility. The late emperor, Tung-chi, succeeded to the throne when only a child five years old, but the government was ably carried on under the co-regency of the empress-dowager, Tze-an, the empress-mother, Tze-sse, and the enlightened Prince Kung, brother of Hien Fung. Tsai-Tien, cousin of Tung-chi, ascended the throne in 1875. As he was then only about four years old, the empresses continued to act as regents.

Of recent events in Chinese history, the most remarkable is the rise, progress, and overthrow of the Tae-ping rebels. Their famous leader, Hung-sew-tseuen, was a man of humble origin, and an unsuccessful candidate for government employment. Some Christian tracts, it is said, led him to renounce idolatry, and he

founded a society of God-worshipers, which, in the autumn of 1850, was brought into collision with the imperial authorities, and immediately assumed a political character. Hung persuaded himself and his followers that he had received a divine commission to uproot idolatry, extirpate the Tartar intruders in the country, and establish the new native dynasty of Tae-ping, or Universal Peace. He assumed the title of Heavenly or Divine Prince (Tae-ping-wang, sometimes called Tien-wang), and bestowed the titles of Eastern Prince, Western Prince, Southern Prince, Northern Prince, and Assistant Prince on five of his chosen leaders. The fanatical principle of divine revelations and other extravagances followed.

They spoke of Tien-ma, the wife of the Heavenly Father; they held that Tien-wang was the son of God as really as Jesus, and worshiped him accordingly. Polygamy was a dark feature of their system, the Tien-wang himself having married 30 wives. The course of this religio-political rebellion, the victorious march of the Tae-ping army from Kwang-se to Nankin in 1850—1853, and its subsequent career, cannot here be traced. We can only afford room to state, that after a series of wasteful and revolting barbarities, it was finally suppressed in 1865 by the imperial troops, led by British and American officers, of whom the most conspicuous and able was Colonel Gordon. See TAE-PINGS.

In early times, the Chinese do not appear to have been opposed to intercourse with foreigners; but the conduct of the Spaniards and Portuguese between 1520 and 1570 excited their hostility. The Mantchu government restricted British trade and intercourse to Canton, where it was carried on through the medium of the *hong* merchants on the one side, and the East India Company on the other. Differences arose, however, from time to time between these two commercial bodies, occasioned chiefly by the exactions of the mandarins on foreign trade. With a view to a better understanding, the British government despatched to Pekin an embassy under Lord Macartney in 1792, and another under Lord Amherst in 1816. On the 22d April 1834, the monopoly of the East India Company ceased, and British imperial officers were appointed to carry out the new judicial and fiscal arrangements. Constant dissensions between these and the mandarins continued till the end of the year 1839, when the latter, under pretence of stopping the opium-trade, committed acts of open hostility. A war broke out the following year, at the commencement of which Chinese officials talked of invading England overland, by way of Russia. The imperial government was, however, sufficiently humbled by the middle of the year 1842, and on the 29th August, a treaty of peace was signed before Nankin, by which the ports of Amoy, Fu-chow, Ning-po, and Shang-hae were, in addition to Canton, thrown open to foreign trade. The other most important articles of the treaty provided that the island of Hong-kong should be ceded in perpetuity to her Britannic Majesty, her heirs and successors, and that the emperor of China should pay 21,000,000 dollars towards the expenses of the war.

With five free ports, British trade with China soon assumed gigantic proportions; and though the Chinese evaded the treaty whenever practicable, no important event occurred to interrupt commercial intercourse till 8th October 1856, when the authorities at Canton seized the crew of the lorcha *Arrow*, a vessel registered at Hong-kong, and entitled, it was considered, to British protection.

Under pressure from the British forces at hand, the imperial commissioner, Yeh, delivered up the men, but refused all apology. Yeh continuing obstinate, Canton was stormed (December 28, 1857) by the allied French and English forces, and the Chinese imperial commissioner captured (January 5, 1858). The government of the city was still carried on by Chinese officials, but under the authority of the plenipotentiaries and commander-in-chief. The former now proceeded to the north of China, to put themselves in more direct communication with the imperial government, which still continued obstinate. The forts at the mouth of the Peiho were taken (May 20, 1858), and at length an important treaty was signed at Tien-tsin, June 26. 1858, which stipulates that the Queen of Great Britain may (Art. ii.) appoint diplomatic agents to the court of Pekin, who (Art. iii.) shall be allowed to reside at the capital, where also her Majesty may acquire a building site. The Christian religion (Art. viii.) shall be protected by the Chinese authorities. . British subjects (Art. ix.) shall be allowed to travel for pleasure or business to all parts of the interior, under passports issued by their consul. British merchant-ships shall trade (Art. x.) upon the Great River (Yang-tze); but as its lower valley is disturbed by outlaws, no port except Chin-keang shall be opened for the present. Chin-keang to be opened in a year from the date of the signing of the treaty.

By this treaty, the vexed question of transit-dues is settled, it being agreed that the British merchant may purchase at the rate of 2½ per cent. *ad valorem*, in case of imports at the port of entry; and in the case of exports he may purchase a certificate enabling him to pass his goods, duty-free, to the port of shipment. By a separate clause, the Chinese government agreed to pay two million taels (about £650,000), as indemnity for losses sustained by British subjects at Canton, and a like sum towards the expenses of the war.

The repulse on the Peiho (June 1859), by a Tartar force concealed in the Taku forts, of the expedition forming the escort of the British and French ambassadors, who were on their way to Pekin, to ratify with the emperor of China the treaty of Tien-tsin, entailed another costly demonstration in the Chinese waters. The Taku forts were captured by the allied English and French forces, August 21, 1860, and Pekin itself in Dec. 1860. The treaty of Tien-tsin was ratified, two additional articles being inserted, one of which legalized coolie emigration. Since 1861, a gradual but beneficial change has come over the spirit of the Chinese government. Prince Kung proved a vigorous and successful regent. The army has been reorganized, and is now subjected to European drill (see par. *Army*); a respect for the observance of treaties has sprung up; a national flag has been adopted, and a desire shown on the part of the Chinese to make themselves acquainted with international law. In 1866, emigration to all other countries was allowed. Shanghai has telegraphic communication with Europe, and Tien-tsin and Pekin are since 1880, connected with Shanghai. In 1883, the Chinese proposed a telegraph from Canton to Shanghai. The first Chinese railway, opened at Shanghai in 1876, was unluckily closed again.

Chinese are now found on almost every shore of the Pacific, where their industry, skill, and sobriety secure them abundant employment. They are especially numerous in the Pacific States of the American Union, where harsh measures, including a heavy tax on arriving, have recently been adopted in order to repress Chinese immigration. Between 1855 and 1880, upwards of 215,000 Chinese had, for a longer or shorter time, established themselves in the United States. The Che-foo convention, in 1876, opened three additional ports. In 1879, China seemed likely to go to war with Russia about the possession of Kuldja; but a treaty was concluded in 1881 between the two countries, in which the territory of Ili, including the town of Kuldja, was given up to China, while the latter agreed to pay an indemnity of 10,000,000 roubles. In 1880, a steamer owned and manned by Chinamen appeared in an American port; and in 1881, the authorities were proposing to lay a railway from Pekin to Tien-tsin, and were promoting manufactures after European methods.

Commerce.—The rivers and numberless canals of China are covered with vessels of all sizes; the Chinese are devoted to traffic. The total value of the imports into China in 1881 was £20,658,500, and of the exports £19,947,300. Tea and silk are the great staple exports from China.

Years.	Exports from China to Great Britain.	Imports of British Home Produce into China.
1870	£9,481,737	£6,139,633
1873.....	12,454,234	4,882,701
1875.....	14,809,632	8,528,311
1877.....	15,323,342	7,912,663

There is no *coinage* in China except the copper *tchen*, or 'cash,' which is in value about the tenth of a halfpenny; and all but the most trifling payments are made by a certain weight in silver, or in Mexican or Spanish dollars. Chinese accounts are kept in taels, mace, candareens, and cash. A tael is worth 6*s*. 8*d*., British currency.

See Meadows's *Chinese and their Rebellions* (1856); Sir J. F. Davis's *China* (1857); Davis's *China during the War and since the Peace* (1852); Williams's *Middle Kingdom* (1848); Oliphant's *Earl of Elgin's Mission to China and Japan* (1859); De Moges's *Baron Gros's Embassy* (1860); Huc's *Chinese Empire* (1858); Cooke's *China in* 1857 *and* 1858; Fortune's *Three Years' Wanderings in China* (Lond. 1847); Fortune's *Visit to the Tea Districts of China* (Lond. 1852); Edkin's *Religious Condition of the Chinese* (1858); Cobbold's *Pictures of the Chinese by Themselves* (1859); *Twelve Years in China, by a British Resident* (1860); *Memoires sur la Chine* (1869); Rev. A. Williamson's *Journeys in North China, &c.* (1870); also Dr. Gray's *China: a History of the Laws, Manners, and Opinions of the People* (1878); Richthofen's great work, *China* (1st vol. 1877); and *Boulger's History of China* (vol. i. 1881).

CHINESE EDIBLE DOG. The kind of dog used as an article of food in China, and reared in order to be so used, being esteemed as a delicacy, is a small dog of greyhound-like form, with somewhat terrier-like head, and muzzle more elongated than in terriers. It is fleet and active, gentle

Chinese Crested (Edible) Dog.

and affectionate. The skin is almost destitute of hair; but there is a variety having a crest of long hair on the head, and a large tuft of hair at the tip of the slender and otherwise naked tail.

CHINESE HEMP. See CORCHORUS.

CHINESE INK. See INDIAN INK.

CHINESE LANGUAGE, WRITING, AND LITERATURE. The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear or more than one syllable), or a nasal. Of such simple words of roots there are about 450. But the emphasis or accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amount to about 1200. There is no distinction of parts of speech in the Chinese language, and no recognition of the principle of inflection, Chinese words being incapable of any modification of *form*. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is *solely* syntax. Thus *ta*, according to its position in a sentence, at one time serves the purpose of an adjective, meaning 'great;' at another, a substantive, meaning 'greatness;' and again of a verb, meaning 'to enlarge' and 'to be great,' or of the adverb 'very.' There are certain words, however, which have at length lapsed into so vague and general a signification, that in conversation and literature they are now used in some cases as particles to determine the relations of other words; but in the older literature this is very rare, and is against the genius of the language. From what has been said, it will readily be inferred that the gender, number, and case of words are not determined by the *form* of the words themselves. They are, in fact, denoted by the addition of other words. Thus, *people* in Chinese is *multitude man*, *son* is *man child*, *daughter* is *woman child*. *The best of men* is in Chinese *a hundred man good*. The purest Chinese is spoken at Nankin, but the same idiom, called 'the language of the mandarins,' is spoken by the educated in all parts of the empire. For a knowledge of Chinese grammar, see Schott's *Chinesische Sprachlehre* (Berlin, 1857); Summer's *Handbook of the Chinese Language* (1863); Julien, *Syntaxe Nouvelle de la Langue Chinoise* (Paris, 1870); Morrison's *Dictionary of the Chinese Language* (Shanghae, 1865).

In Chinese the written character, generally speaking, does not indicate the sound of the word, but gives a kind of hieroglyphic or pictorial representation of the idea or thing to be expressed. Hence there are required as many of these characters or symbols as there are ideas to be represented. Since many words similar in sound are different in signification, whilst in writing each idea has its peculiar symbol, the number of words represented by writing —without reckoning those peculiar to certain dialects—is perhaps ten times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000, but these are far from being all in general use. In writing and printing, the characters are arranged in perpendicular columns, which follow one another from right to left.

In its origin, Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; the larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for this purpose; so that the great mass of Chinese written words consist of an ideographic and a phonetic element. Native grammarians divide their characters into six classes. The first class comprises simple pictorial representations of sensible objects, such as sun, moon, mountain, &c., and contains 608 characters, The second class includes such characters as are formed by the combination of two or more simple hieroglyphs, which together convey, in a more or less intelligible manner, some other idea: for example, the hieroglyph for sun, combined with that for moon, conveys the idea of light; mouth and bird, that of song, &c.; of these there are 740. The third class embraces those characters which indicate certain relations of position, as above, below, the numerals, &c; of these there are 107. The fourth class consists of characters which, by being inverted, acquire an opposite signification, as right, left, standing, lying, &c., and contains 372. The characters of the fifth class are termed derived characters; the meaning of the simple or compound characters used to express physical objects, is transferred to mental objects, or to other physical objects with which they are associated, e. g., the hieroglyph for a heart signifies the soul—that for a room, signifies the wife, &c.; of these there are 598. The characters of the sixth class include those which are composed, as above mentioned, of sign and sound. Almost all names of plants, fishes, birds, and many other objects which it would be difficult to represent hieroglyphically, are denoted by the compound characters of the sixth class, which amount to 21,810 in number. As this class, however, consists merely of repetitions of the other five classes, the immense number of Chinese characters may be reduced to 2425; and whoever learns these may be said to know them all.

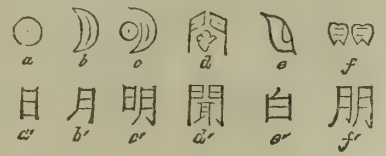
The hieroglyphical characters in their oldest form were easily recognizable figures: thus, the hieroglyph for sun was as in the fig. at *a*; for moon, as at *b*; for light, a combination of sun and moon, as at *c*; for to listen, folding-doors and an ear, as at *d*; for white, a very squint eye, in which hardly anything but the white is seen, as at *e*; for friends, the two valves of a bivalve shell, as at *f*. In the course of time, through hasty and careless tracing, the objects denoted by the hieroglyphs have almost ceased to be recognizable. The modern hieroglyphs corresponding to the above are as represented at *a'*, *b'*, *c'*, &c. See Abel Rémusat's 'Mémoire sur l'Ecriture Chinoise,' in the *Mémoires de l'Académie des Inscriptions*, vol. viii.; and for a view of the Chinese characters, both ancient and modern, Hager's *Monument de Yü* (Par. 1802.)

The Chinese literature in a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the Emperor Kien-long's library is composed of 122 volumes; and a selection of the Chinese classics, with commentaries and scholia, which was begun by the order of the same emperor, is said to comprise 180,000 volumes, of which, in the year 1818, 78,731 volumes had already appeared. In the five canonical or classical books, called *King*, are contained the oldest monuments, Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius (q. v.), in the 6th c. B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down to us. Next to these in value are the *Sse-shu*, or the four books. These, as they were written by Confucius and his disciples, must be regarded as the most trustworthy source of insight into the intellectual and political life of the Chinese. A complete and elaborate edition of the five *King* and the four *Shoo* has been undertaken by our great English Sinologue, Dr. Legge, under the title of 'The Chinese Classics, with a translation, critical and exegetical notes, prolegomena, and copious indexes. In seven volumes,' of which five vols. appeared between 1861 and 1878. A popular edition, under the title of 'The Chinese Classics translated into English,' has also been published, of which vols. i. and ii. deal respectively with the 'Life and Teachings of Confucius' and the 'Works of Mencius.' Almost contemporary with Confucius lived Lao-tse (q. v.), who was born 604 B.C. He was the founder of a school of philosophy, more spiritual in its character than that of Confucius, but which has now degenerated into the lowest and most vulgar kind of demonology; see *Le Livre de la Voie de la Vertu*, Chinese and French, by Julien (Par. 1842). In mythology, the Chinese have *The Book of the Mountains and Seas*. *The History of the Gods and Spirits*, and some others. In jurisprudence may be mentioned the universal collection of laws, and the criminal code of the present dynasty; see *Ta-Tsing-lu-li, being the Fundamental Laws and Supplementary Statutes of the Penal Code of China*, by Staunton (Lond. 1810). The Chinese literature is also very rich in works on medicine, natural history, astronomy, agriculture, military science, music, and all branches of mechanics and industry; see *Résumé des principaux Traités Chinois sur la Culture des Mûriers et l'Education des Vers-à-soie*, by Julien (Par. 1837). In philology, the most valuable works are the dictionaries, in which the Chinese characters have been collected and elucidated by examples from the whole treasury of Chinese literature; but the greatest of all works of this kind is the dictionary of the Emperor Kang-hi, which is now regarded as the highest authority for the pronunciation and meaning of the characters. Of the encyclopædias of the Chinese, the most conspicuous are that by Ma-tuan-lin (1300 A.D.), called *Wen-hien-thong-khao*—i. e., an accurate investigation of the ancient documents, with rich supplements; and the *Koo-kin-too-shoo-tesi-ching*, or *Complete Collection of Ancient and Modern Books*—of which latter vast work a copy was secured for the British Museum in 1877.

But the most valuable portions of the Chinese literature are, undoubtedly, their historical and geographical works, which are indispensable to a knowledge of Upper Asia. Sse-ma-thsian (100 B.C.) compiled, from every recognized authority, a work called *Sse-ki*, or historical memorials, which embraces the history of China from the year 2637 B.C. up to the commencement of the dynasty of Han in the 2d c. B.C. This work has been continued by the different dynasties, and forms a complete collection of the annals of the empire up to the termination of the Ming dynasty in 1643 A.D. It is known under the title of *Nian-eul-sse*, or the 22 histories. The entire collection of the official annals from 2698 B.C. to 1645 A.D., comprising a period of 4343 years, and consisting of 3706 books, is to be found in the library at Munich.

Amid all their scientific labors, the Chinese have not neglected the art of poetry, in which they possess voluminous collections that have yet to be made known to Europe. In lyrical poetry, the most

distinguished names are Li-thai-pe and Tu-su, both of whom flourished at the beginning of the 8th c. A.D.; see Davis 'On the Poetry of the Chinese,' in the *Transactions of the Royal Asiatic Society*, vol. ii. The romantic poetry of the Chinese, although void of poetic beauty, is valuable for the insight it gives into their domestic life. Their dramatic poetry has laws peculiar to itself, and resembles partly the romantic drama of the Germans, and partly the *comedia delle arte* of the Italians. They have also a kind of novel in dialogues, which forms a subordinate species of



Chinese Characters.

drama. Besides the speaking persons or actors, there is what they call a singing person, who introduces into the piece songs which he sings to popular melodies, and appears to correspond in a rude way to the Greek chorus. The best collection of works in this species of literature is the *Yuen-dschin-pe-tschong*, i. e., the hundred dramas from the Mongol dynasty (1260—1341), from which all the Chinese dramas known to Europeans have been taken. A Chinese novel affording a graphic view of Chinese tastes and opinions was translated by Stanislas Julien, under the title of *Les Deux Jeunes Filles Lettrées*. English readers may obtain pictures of Chinese life from *Iu-kias li*, or the Two Fair Cousins, translated from the French; and *The Flowery Scroll*, translated by Bowring. There are French and English translations of a number of the more important Chinese works. See also Schott's *Chinesische Sprachlehre*, Davis's *Chinese Miscellanies*, and *Wylie's Notes on Chinese Literature*, Gabelentz's *Ch. Grammatik*, Marshman's *Elements of Chinese Grammar*, Legge's *Chinese Classics*, and Mason, *The Chinese, their Education, Philosophy, and Letters* (1881).

CHINESE SEA, or CHINA SEA, that portion of the Pacific Ocean which has China and Siam on the west, the island of Formosa on the north, the Philippines on the east, and Borneo on the south, and which forms the great Gulfs of Tonquin and Siam.

CHINESE WHITE. The white oxide of zinc has recently been introduced into the arts, under this name, as a pigment in place of the preparations of white-lead. It changes very little either by atmospheric action, or by mixture with other pigments; but it has not the body of white-lead.

CHINGLEPU'T.—1. A fort, with a town adjacent, in lat. 12° 41′ N., and long. 80° 2′ E., 36 miles to the south-west of Madras. It is accessible to an enemy only from the south, having a tank or artificial lake on the east and part of the north, and rice-fields, irrigated from the same, on the remainder of the north and on the west. In the dry season, the tank is nearly exhausted, the weeds and slime in its bed causing malaria. Notwithstanding this, however, the place is considered to be more than ordinarily healthy. Pop. of town (officially spelt *Chengalpat*) in 1871, 7979.—2. A district taking its name from the town above mentioned. It stretches in N. lat. from 12° 14′ to 14°, and in E. long. from 79° 35′ to 80° 25′, and contains 2753 square miles. Pop. (1871) 938,184. With about 120 miles of coast, it has not a single harbor or anything like shelter from the surf. Nor is its internal navigation of any value. The only considerable river, the Palar, is in most parts destitute of water during the dry season. Excepting in October, November, and December, comparatively little rain falls. From that circumstance, and perhaps also from an inferiority of soil, cultivation is said to be so much circumscribed, as to embrace only about 96,000 acres, or 1-20th part of the entire area.

CHINI′, a village of the Punjab, about a mile from the right bank of the Sutlej, the most easterly of the five rivers which give name to the country. It is in lat. 31° 31′ N., and long. 78° 19′ E., and is 8770 feet above the sea. Notwithstanding this elevation, it is a delightful place of sojourn, and was a favorite residence of Lord Dalhousie. It occupies a slight depression on the southern slope of a lofty mountain, which fertilizes the soil with a net-work of never-failing rills. The neighborhood is remarkable for the size and flavor of its grapes, while the vines, trained over horizontal lattices, afford while in foliage, a tolerably continuous shelter.

CHIN-KEANG-FOO ('River-Guard City'), a Chinese city and port on the Yang-tze-kiang, at the junction of the Grand Canal with that river, and about 150 miles from its mouth, was opened to European commerce by the treaty of Tien-tsin (1858), and a British settlement was begun in 1864; but trade is very slowly developing, and there is reason to doubt if C. will ever become a place of importance. The anchorage is bad, the port is not a natural outlet for any staple of exportation produced in the neighboring country, and it possesses no advantage as regards the introduction of foreign goods. Formerly, however, as the southern key of the Grand Canal, it was both an important stronghold and a center of traffic. The injury which the Grand Canal has sustained has for the present practically extinguished the inland trade, and the four years (1853—1857) during which it was in the barbarous hands of the Tae-pings are said to have reduced the population from half a million to 500.

CHINNOR, a musical instrument of the ancient Hebrews, with 32 strings.

CHINON, a town of France, in the department of Indre-et-Loire, beautifully situated on the Vienne, 25 m. S.W. of Tours. It has the remains of a huge old castle, formerly the occasional residence of the Plantagenet kings of England, and also of some of the French sovereigns, and celebrated as the place where Joan of Arc commenced her historical career, and as the birthplace of Rabelais. C. has manufactures of druggets, serges, earthenware, &c. Pop. (1876) 4536.

CHI'NQUAPIN. See CHESTNUT and OAK.

CHIN'SURA, a town on the right bank of the Hooghly, about 20 miles above Calcutta, in lat. 22° 53′ N., long. 88° 23′ E. Pop., along with Hooghly (1871), 34,761. It contains the Hooghly College, and is considered one of the healthiest places in Bengal. It was originally a Dutch settlement, but was ceded in 1824 to the British, along with some other places on the mainland, in exchange for the English possessions in the island of Sumatra.

CHINTZ, a highly glazed printed calico, with a pattern in many colors on a white or light-colored ground. It is chiefly used for bed-hangings, for covering furniture, and other purposes where gay colors are desired, and where there is much exposure to dust, which does not adhere to its highly calendered surface.

CHI'O. See SCIO.

CHIOCO'CCA, a genus of tropical and subtropical plants, of the natural order *Cinchonaceæ*, of which two species in particular, *C. anguifuga* and *C. densifolia*, the former a trailing herb, the latter a bushy shrub, enjoy a high reputation in their native country, Brazil, as cures for snake-bites. An infusion of the bark of the root is certainly one of the most violent emetic and drastic medicines known, its action being accompanied with spasmodic agitations of the whole frame and other symptoms, such as to preclude its use except in the most extreme cases. Yet it had at one time a high reputation in Europe, and was administered in small doses as a diuretic and purgative.

CHIO'GGIA, or CHIO'ZZA, an important commercial town and seaport of Northern Italy in the province of Venice, stands on an island of the same name in the Adriatic, and is connected with the mainland by a stone bridge of 43 arches. The population, amounting to (1881) 20,381, are chiefly engaged in the coasting-trade, in lace-making, and in ship-building.

CHIO'NIS and CHIO'NIDÆ. See SHEATH-BILL.

CHIP HATS. See BRAZILIAN GRASS.

CHI'PPENHAM, a parliamentary and municipal borough in Wiltshire, in a valley on the left bank of the upper part of the Bristol Avon, on the Great Western Railway, 22 miles east of Bristol. It consists chiefly of a well-built street above half a mile long. A bridge of 21 arches crosses the Avon here. C. is famed for its markets of cheese and corn, its cheese-market being one of the largest in Britain. There are silk and woollen manufactures; and some mineral springs in the vicinity. Population of parliamentary borough, (1881) 4495; of municipal, 1352. It returns one member to parliament. C. was the seat of the Saxon kings of Wessex. About 880, the Danes took it from Alfred, and kept it two years.

CHI'PPEWAYS. See INDIANS.

CHIQUICHIQUI PALM (*Leopoldinia Piassaba*), the PIASSABA of the north of Brazil, and one of the palms which yield the Piassaba (q. v.) fibre, now so much used for making brushes. The Piassaba fibre exported from Pará is all obtained from it. It grows in swampy or occasionally flooded lands on the banks of the Rio Negro and other rivers of Venezuela and the north of Brazil; and has a crown of very large, regularly pinnate leaves, with smooth slender stalks. The leaves, like those of many other palms, are much used for thatching. The commercial fibre is obtained from a remarkable covering of the stem; formed of marginal processes of the leaf-stalks, elongated into ribbon-like strips, and interlaced, finally splitting into fine fibres, hanging down five or six feet, and entirely concealing the stem, so as to give the tree a very extraordinary appearance. It twists readily into cordage, and the fibre has been long used for cables of canoes on the Amazon and other rivers. Before the independence of Brazil, the

Portuguese government had a factory on the Rio Negro, for the manufacture of cables of this fibre. The export of the unmanufactured fibre from Pará to England began about the middle of the present century.

CHIQUIMU'LA, Isthmus of, in Central America, to the south-east of the peninsula of Yucatan, in long. 89° W. Its breadth from the Caribbean Sea to the Pacific is about 150 miles—the greatest elevation not exceeding 2000 feet.

CHIRA'TA, CHIRE'TTA, or CHIREE'TA (*Agathotes Chirayta*, also known as *Ophelia Chirata*), an officinal plant belonging to the natural order *Gentianeæ*, and possessing properties similar to those of the common Gentian, the Centaury, and other plants of that order. It is a native of the mountains of the north of India. The whole plant is intensely bitter, and has been long used in its native country as a tonic and stomachic. It is also in high estimation with European practitioners in India as a febrifuge, and is often used by them as a substitute for cinchona. The medicinal virtues reside both in the herb and root. The whole plant is pulled up at the time when the flowers begin to fade, and is dried for use. It is now imported to some extent into Britain.

CHIRIQUI', a name of various application in Central America. —1. A province on the isthmus and in the state of Panama, Columbia; area 500 sq. m.; pop. 18,000.—2. A river flowing towards the north—the lat. and long. of its mouth being about 9° N., and 82° 30′ E.—3. A spacious lagoon with three entrances, and with a depth of water for the largest ships, which receives the river. It measures 90 m. along the coast, and 40 or 50 in width.—4. An archipelago between the lagoon and the Caribbean Sea.

CHI'RON, or CHEIRON, the most famous of the Centaurs (q. v.). In the ancient works of art, C. of course appears as half-man, half-animal; but his features, instead of expressing mere savage and sensual strength, as those of the Centaurs generally do, are marked by a mild wisdom, in harmony with the character and deep knowledge attributed to him by the Greek mythologists.

CHI'RRA POO'NJEE, a town in the north-east of India, in lat. 25° 14′ N., long. 91° 45′ E. It stands on the Cossya Hills, at the height of 4200 feet above the sea—and has a temperature during the hot months of 20° F. lower than that of the plains of Bengal. Notwithstanding this, however, the place has proved unsuccessful as a sanatorium. The vicinity abounds in mines of coal and iron, which may be profitably worked.

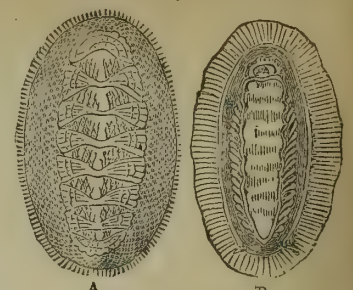
CHI'RU (*Antilope Hodgsoni*), a species of antelope, inhabiting the pine-forests and elevated open plains of Tibet, in regions bordering on the limits of perpetual snow. It is much larger than the chamois, being about five feet in length, and the height at the shoulder about three feet. The C. lives in great herds, and seems to exceed almost all the other gregarious ruminants in watchfulness against the approach of danger. Sentinels are constantly posted, to prevent surprise.

CHI'SWICK, a village in the center of Middlesex, 7½ miles south-west of St. Paul's, London, on the left bank of the Thames. Pop. (1881) 15,975. Around C. are many fine villas, extensive market-gardens, to supply London, and the gardens of the London Horticultural Society.

CHI'TIN forms the skeleton of all insects and crustaceans. In insects, it constitutes not merely the external skeleton, the scales, &c., but also forms their tracheæ, and thus penetrates into the most remote portions of their organs; indeed, one of the layers of their intestinal canal consists of chitin. Hence, we can make good preparations of these parts by treating insects with a solution of potash, which dissolves all but the C.: in this way, we can microscopically examine the most delicate parts, as, for instance, the valves of the tracheal openings.

In a state of purity, it is a white amorphous body, which usually retains the form of the tissue from which it is prepared. It has been analyzed by C. Schmidt, Lehmann, and other chemists. Schmidt considers that its composition is represented by the formula $C_{12}H_{21}NO_{10}$. The best method of obtaining C. is by boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalies. The substance left after these respective boilings is pure chitin. It seems to be identical with the substance termed by Lassaigne *Entomaderm*.

CHI'TON a Linnæan genus of mollusks. Linnæus, regarding merely the shell, placed them in the class of Multivalves, a class entirely artificial. They are now regarded as constituting a family (*Chitonidæ*) of gasteropodous mollusks, of the order *Cyclobranchiata* of Cuvier, and as occupying a place in systematic arrangement close to limpets. The shell is composed of eight narrow, transverse, calcareous pieces, overlapping each other in a row along the back, strongly attached to the mantle, which is remarkably fleshy and fibrous. They have the power of rolling themselves up into a ball. The organ of locomotion is an oval foot, more or less wide, according to the species, and extending the whole length of the animal. More than 200 species are known; they occur in all climates, most abundantly on rocks at low-water, but some of them at great depths. Some of them creep along the sand. All the British species are small; but some foreign ones grow to three or four inches in length. The fry of these mollusks swim about by means of long vibratile cilia.



A B

Chiton Squamosus:
A, animal and shell seen from above; B, animal seen from below.

CHITTAGO'NG, or ISLAMABA'D (the second name having been conferred by Aurungzebe, who captured it towards the close of the 17th c.), a city of India, standing on the Kurrumfuli, about 7 miles from its mouth, in lat. 22° 20′ N., and long. 91° 54′ E. It came into the possession of the British, along with Bengal Proper, in 1760—1765. But having originally formed part of Arracan, it was claimed, after a lapse of sixty years, by the Burmese emperor as a dependency of that territory—a claim which formed one of the grounds of the war of 1824. Through the results of that contest, C. diminished in importance, but some European merchants began to settle there in 1864, and its prosperity is returning. In 1873 it exported 104,565 tons of rice. Its shipbuilding business is now transferred in great measure to Moulmein, in Tenasserim. Pop. (1871) 20,604.

CHITTAGONG, a maritime district in Lower Bengal, taking its name from its capital above mentioned. It is bounded on the S. by Arracan, and on the W. by the Bay of Bengal, and stretches from lat. 20° 45′ to 23° 25′ N., and from long. 91° 32′ to 93° E. It has an area of 2498 sq. m., with a pop. (1871) of 1,127,402. C. (properly *Chattagrám*) also gives name to a *division;* area, 13,592 sq. m.; pop. 3,444,874. In the forests of C., large numbers of elephants are annually caught.

CHI'TTAGONG WOOD, the wood of *Chickrassia tabularis*, a tree of the natural order *Cedrelaceæ*, a native of the mountainous countries to the east of Bengal. In some parts of India, it is called *Cedar* or *Bastard Cedar*, names, however, which are also given to other kinds of wood. C. W. is much valued in India, and is used for all purposes for which mahogany is used in Britain. It makes beautiful and light furniture, but is apt to warp in very dry weather. Beautifully veined and mottled pieces are occasionally met with, and are highly valued.

CHITTO'R, the name of two fortified towns in India.—1. C. in the district of Arcot, about 80 miles to the west of Madras, in lat. 13° 12′ N., and long. 79° 9′ E. It stands on the south or right bank of Puni, an affluent of the Palar, and is about 1100 feet above the sea. Its river varies, according to the season, from a small rivulet to an expanse of 400 yards in width. When the stream is at its lowest, the very tanks, as well as the deserted channel, become little better than slime—the result being fever, ague, dysentery, and other diseases. The thermometer has occasionally reached 140° in the sun; but the annual range in the shade runs from 56° to 100°.—2. C. in Odeypoor, or Mewar, about 270 miles to the south-west of Agra, in lat. 24° 52′ N., and long. 74° 41′ E. The fortress occupies the summit of an isolated rock of nearly 6000 yards in length, and of 1200 in breadth, which is scarped all round to a depth of 80 or 100 feet, about a fourth part of its entire altitude. Within the enclosure are several antique structures—such as temples, tanks, a palace, commemorative pillars, and an inner citadel.

CHIU'SA, La, a town of N. Italy, province of Cuneo, situated on the left bank of the Pesio, 8 miles S.E. of Coni. It has manufactures of silk and glass, and a population of 3000.

CHIU'SA, La (so called from the ground having been originally *enclosed* as pasture-land for horses), a town of Sicily, in the province and 30 miles south-south-west of Palermo, on the slope of some hills. The town was built in 1320. Agates are found in the vicinity. Pop. 6840.

CHIU'SI, a town of Central Italy, province of Siena, 37 m. S.E. of Siena, with a population of 3000, stands on an eminence in the Val di Chiana, not far from the lake of the same name. In ancient times, under the name of *Clusium*, it was one of the twelve republics of Etruria, and the residence of Porsena (q. v). When Italy was overrun by the barbarians, C. fell into decay, the whole valley was depopulated, and became the pestilential pool described

by Dante. Since the improvement of the course of the Chiana (q. v.), C. has begun to flourish again along with the whole district. But it is in connection with the discovery of Etruscan antiquities that C. is chiefly heard of. Within the last quarter of a century, immense quantities of these remains have been found in the neighborhood in the grottos that served the ancient Etruscans as tombs. There are three museums in C. filled with them, and a great number are in the public gallery at Florence. They consist chiefly of sun-dried earthenware vases, black, and partly covered with mythological figures. Excavations still continue to be made, but discoveries have become rarer of late years.

CHI'VALRY (Fr. *chevalerie*, from *chevalier*, a knight or horseman), the system of knighthood, together with the privileges, duties, and manners of knights. The social arrangement to which this term is applied seems first to have assumed the character of a positve institution during the 11th c.; but so far from being an invention of that period, it had its roots in the manners of the Germanic races, amongst whom it ultimately arose, at the earliest period at which they are historically traceable. In the description which Tacitus has given us of the manners of the Germans, we find the most unequivocal indications of the existence, not only of the general spirit, but, in partially developed form, of many of the special arrangements of chivalry. But it was in connection with feudality that C. attained to its full proportions, and in many respects it must be regarded as the complement of that institution. See FEUDAL SYSTEM.

Whilst feudality exhibits the political, in C. we see the moral and social side of the arrangements of medieval life. It was in feudal mansions of the barons that the system was developed; and to the lay portion of the youth of the higher classes, the instruction which they there received in the usages of C. formed by far the most important part of education. In addition to the martial accomplishments, which corresponded to those of a modern cavalry-officer, they were instructed in the political relations which subsisted between the vassal and his lord, by which the whole body of society was then bound together; and in what might almost be called a system of ethics, strangely enough exhibiting unmistakable traces of the Stoic philosophy. The analogy between the severer virtues recommended to the special cultivation of their disciples by the followers of Zeno, and those inculcated on the novice in C., and practised by the knights of the middle ages, might be ascribed to other than historical causes, were it not that we are able to trace the connection between them with something approaching to certainty. If any one wishes to convince himself of the truth of our assertion, let him compare the last production of the intellectual life of antiquity with one of the earliest and most important of our own literature, the *Consolations of Philosophy* of Boethius with Chaucer's *Testament of Love*. The resemblance is so close, that the latter work has, not without reason, been regarded as an imitation af the former; but the main features which distinguished them, and marked Chaucer's work as belonging to the modern world, are more instructive than even their similarity. The place which Philosophy, the celestial consoler, occupies in the work of Boethius, in that of Chaucer is supplied by *Love*—a being whom we must in nowise confound either with the heathen goddess, or, as some have done with the divine love of the Christian religion. She is neither more nor less than the embodiment of an abstract idea which formed the central point of the whole system of C.; and her substitution for the Philosophy or Reason of Boethius is very characteristic of a state of society in which the affections and passions, rather than the intelligence, were the motive principles. The 'Love' of Chaucer is a complete generalization, although independent of individual object, and the consolation which she proffers to her votary is that of enlisting in his favor the special guardian, the 'Margarite,' who is supposed to watch over his individual fortunes. The 'Margarite' seems to correspond to the chivalrous idea of the *Lady-love*, in its purest sense, when its reference to a person was by no means indispensable, but when it signified rather 'the love of woman,' the highest object of the knight's ambition.

Under the protection of this guardian spirit, the lover is represented as altogether sheltered from the caprices of fortune, and in her name he has a dose of rather frigid comfort administered to him, greatly resembling that which Boethius receives at the hands of Philosophy. Such is the general idea of the book, and it is a noble idea, embracing the very essence of society as it existed then, and presenting a much deeper view of that singular institution C. than is usually to be met with in writers who have not been actually brought in contact with its influences. But to the two elements which we have mentioned as ingredients in the spiritual life of C., the Germanic traditions on the one hand, and those of classical antiquity on the other, a third falls to be mentioned, which was, perhaps, the most important of all—that of Christianity as represented by the church. The clergy were too fully aware of the importance of early impressions, not to seize on the imagination of the aspirant to C. at the all-important moment of his inauguration. The purifications, prayers, and vigils, the sacrament and the vows by which this solemn rite was accompanied, are detailed elsewhere (see KNIGHT, BANNERET, BATH, &c.); and their influence in casting a religious character over the whole institution of C., and occasionally in directing its energies specially to the propagation of Christianity, by means of the various religious orders of knighthood and the Crusades, is well known. Nor was the poet behind the priest in availing himself of the influences of C., and developing them in the region of the imagination. What Chaucer has exhibited in the work to which we have referred, may be regarded rather as the philosophical than the poetical side of the institution. But to poets of a lighter and more imaginative cast of mind, C. has furnished, from the days of the troubadours down to the present poet-laureate, no insignificant portion of their subject-matter. King Arthur and his Knights of the Round Table, the traditions regarding whom had been taken from a period altogether mythical, and long anterior to the existence of C. as an institution, became to the poetry of the middle ages very much what the heroes of the Trojan War were to that of the whole ancient world. Much astonishment has often been expressed at the contrast between the lofty and ideal purity of the code of morals inculcated by C., and the grossness of the lives of the men who were trained under its influences. The case is one which in a remarkable degree proves the practical importance of the inculcation of sound doctrine, for the practice gradually, though slowly, conformed itself to the principles; and it is probably in no insignificant degree to the elevated tone of the latter that we owe the moral superiority of the modern over the ancient world.

CHI'VALRY, COURT OF, a military court, established by Edward III., of which the Earl Marshal and the Lord High Constable were joint judges. When held before the Earl Marshal alone, it was merely a court of honor; but when both were present, it was also a criminal court. Having encroached on the common law, its jurisdiction was defined by 13 Rich. II. stat. i. Under this act, the court claimed power to give relief to such of the nobility and gentry as think themselves aggrieved in matters of honor, and to keep up the distinctions of degrees and quality. In criminal cases, a jury was sworn; but in general the proceedings of the court were summary matters, being brought under its cognizance by complaint or petition. An attempt was made to revive the functions of the court in Queen Anne's time; but, except as represented by the Earl Marshal's court (see COLLEGE OF ARMS), it has now gone into abeyance.

CHIVA'SSO, a small city of Piedmont, Northern Italy, situated in a fertile plain on the left bank of the Po, about 15 miles north-east of Turin. It was formerly a place of considerable military importance, but its fortifications were destroyed in 1804 by the French. The lampreys of C. are celebrated throughout Piedmont. It has manufactures of bricks, earthenware, soap, &c., and a trade in the agricultural produce of the district. Pop. 4800.

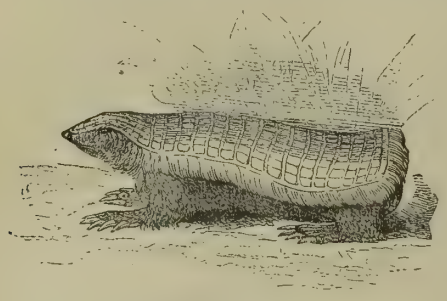
CHIVE, or CIVE (*Allium schæno'prasum*), a plant of the same genus with the leek and onion (see ALLIUM), a perennial, ½—1 foot in height, with very small, flat, clustered bulbs, increasing by its bulbs so as to form a sort of turf. The leaves are tubular, cylindrical-tapering, radical, nearly as long as the almost leafless flowering-stem, which is terminated by a hemispherical, many flowered, not bulbiferous umbel of bluish red, or, more rarely, flesh-colored flowers. The stamens are included within the perianth. This rather pretty little plant grows wild on the banks of rivers, and in marshy or occasionally flooded places in the middle latitudes of Europe and Asia. It is a rare native of Britain. In some of the mountainous districts of Europe a variety is found, larger and stronger in all its parts, and with flowering-stems more leafy. Chives—the name is generally used in the plural—are commonly cultivated in kitchen-gardens, often as an edging for plots, and are used for flavoring soups and dishes. Their properties are very similar to those of the onion. The part used is the young leaves, which bear repeated cuttings in the season.

CHIZEROTS AND BURINS form one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They live in the arrondissement of Bourg-en-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Although industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, who are often indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer, or well-to-do day-laborer, become the wife of one of them, so that they mostly marry among themselves. From time immemorial, the C. and B. have been field-laborers, cattle-dealers, butchers, &c. Many of them are very good-looking. The young women are handsome, clear-complexioned, with large

black eyes. See Michel *Histoire des Races Maudites de la France et de l'Espagne* (2 vols. Par. 1847).

CHLADNI, Ernst Florens Friedrich, founder of the science of acoustics, was born at Wittenberg, November 30, 1756. He studied law in his native place, and also in Leipsic, where, in 1782, he was made Doctor of Laws. C. ultimately abandoned juridical studies altogether, devoted his mind to natural science, and, being acquainted with music, was led to observe that the laws of sound were by no means so well established as those of other branches of physics. He therefore began to apply his knowledge of mathematics and physics to acoustics, and traveled for ten years (after 1802) through Germany, Holland, France, Italy, Russia, and Denmark, giving lectures on the subject, which were very successful. He died in Breslau, April 3, 1827.—C.'s writings include, *Discoveries concerning the Theory of Sound* (1787), *Acoustics* (1802), *New Contributions to Acoustics* (1817), and *Contributions to Practical Acoustics, with Remarks on the making of Instruments* (1822). C. also wrote several essays on meteoric stones.

CHLAMY'PHORUS (Gr. chlamys-bearing; *chlamys*, a soldier's cloak), a very remarkable genus of mammalia of the order *Edentata*, ranked by naturalists in the same family with the armadillos,



Chiamyphorus.

but differing in important respects from them, and from all other known quadrupeds. Only one species is known, *C. truncatus*, five or six inches long, a native of the interior of Chili, living underground like the mole, which it much resembles in its habits, and feeding on the same kind of food. Its fore-feet are adapted for digging, although in a different manner from those of the mole. The skull is destitute of sutures; there are resemblances to the osteology of birds in the ribs and their union to the sternum; the hinder part of the body is altogether unlike that of any other known animal, in its terminating quite abruptly, as if cut off almost where its thickness is greatest, or as if the back were suddenly bent down at right angles, the tail not springing from where the line of the back appears to terminate, but far below. The whole upper and hinder parts of the body are covered with a coat of mail, made up of a series of square plates; the under parts and legs are covered with long silky hair. The tail is very peculiar; it is covered with small scales, is expanded at the tip, and is usually incurved along the belly, but is furnished with such muscles as to suggest the probability of its being employed to throw back the earth in excavations.

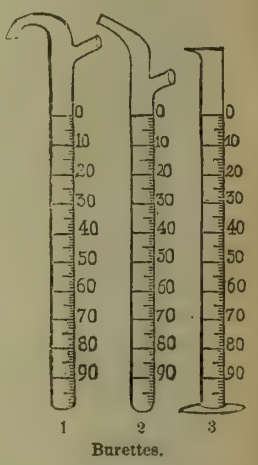
CHLOPICKI, Joseph, a Polish general, and Dictator of Poland during the revolution of 1830, was born in Galicia in 1772. He entered the army in 1787, attracted the notice of Kosciusko during the first insurrection of the Poles, and after the storming of Praga, 9th November 1794, when the hopes of the patriots were extinguished for awhile, he passed into the service of the new Cisalpine Republic, and distinguished himself in various battles. In 1806 when Bonaparte called the Poles to arms, C., among others, obeyed, and fought gallantly at Eylau and Friedland. He was subsequently sent by the emperer into Spain, and in 1812 followed him to Russia, taking part in the bloody engagements at Smolensk and Moskwa. After the relics of the invading force had returned, C. left the imperial service, on account of receiving certain slights in the way of his professional advancement. After the taking of Paris by the allies in 1814, he led back to Poland the remains of the Polish troops who had fought under Bonaparte, and was well received by the Emperor Alexander, who made him a general of division. When the second insurrection of the Poles broke out in 1830, C., who foresaw the hopeless nature of the attempt, concealed himself; but the voice of the nation called him forth from his hiding-place, and on the 5th December 1830, he was elected dictator. His moderate views, however, involved him in disputes with the extreme patriotic party, and on the 23d January 1831, he resigned his office; but he entered the Polish army as a simple soldier, and fought at Wavre and Grochow. He afterwards retired into private life, and died 30th September 1854.

CHLORAL is a limpid, colorless, oily liquid, with a peculiar penetrating odor, and is formed when anhydrous alcohol is acted on by dry chlorine gas. It dissolves sulphur, phosphorus, bromine, and iodine, and is closely allied to aldehyde. C. combined with one equivalent of water forms chloral hydrate, often popularly called chloral. C. was discovered by Liebig in 1831, and investigated by Dumas; the C. hydrate was first used as an anæsthetic and hypnotic by Liebreich in 1869. Though now often abused by being taken recklessly as a narcotic, C. hydrate is a valuable addition to the pharmacopeia; it is used to procure sleep in insomnia, and in various nervous diseases, insanity, delirium tremens, neuralgia, and strychnia poisoning. The average dose is from 15 to 30 grains; an overdose will cause death.

CHLORANTHA'CEÆ, a natural order of exogenous plants, closely allied to the peppers; herbaceous and half-shrubby plants. The number of known species is small: all of them are tropical, or natives of China and Japan. They are generally aromatic, and some of them are used as antispasmodics, stimulants, stomachics, and tonics. The roots of *Chloranthus officinalis* and *C. brachystachys* have been ranked among the most efficacious remedies in fevers and other diseases requiring continual and active stimulants, and instances have occurred of great benefit from their employment during the prevalence of epidemics in Java. *C. inconspicuus* is the Chu-Lan of the Chinese; its leaves, spikes of flowers, and berries are used by them for imparting a peculiar fragrance to tea. All the teas which have what is called the *cowslip flavor* owe it to this plant.

CHLO'RIC ACID (ClO_5) is a compound of one atom of chlorine and five atoms of oxygen, and is generally met with in combination with potash, as the white chrystalline salt, chlorate of potash (KO,ClO_5). This salt is mainly interesting from the readiness with which it parts with its oxygen to combustibles, as when thrown on red-hot charcoal, when it causes violent deflagration. The salt is employed in the fabrication of certain kinds of lucifer-matches, which give a slight explosion when struck. If a crystal of chlorate of potash be placed on a piece of paper saturated with turpentine, and a drop or two of oil of vitriol added, it causes the inflaming of the turpentine with explosive rapidity. The chlorate of potash is also used in medicine, with the view of imparting oxygen to the blood.

CHLORI'METRY, or CHLORO'METRY, is the process of estimating the proportion of available chlorine in bleaching powder (q. v.), which may vary from 20 to 36 per cent. The process depends upon the great power with which chlorine, in the act of being liberated from its compounds, causes the oxidation of many substances. The salt generally used is pure crystallized sulphate of iron, which, in its ordinary state, gives a deep blue color, with a drop of ferridcyanide of potassium, but ceases to do so when it has been fully oxidized, or converted from a proto-salt into a per-salt, through the influence of chlorine. It being known that 78 grains or parts of sulphate of iron are oxodized by 10 grains or parts of chlorine, the mode of procedure in C. is as follows: 78 grains of fine crystals of the sulphate of iron are dissolved in water slightly acidulated with hydrochloric acid in a white porcelain basin. A given quantity of the bleaching powder—say 50 grains—is dissolved in a little tepid water, and introduced into a tall measure-glass called a chlorimeter or burette (figs. 1, 2, and 3), similar to an alkalimeter, which is divided into 100 parts, and water added till the solution rises to the top mark.



Burettes.

After subsidence of the insoluble matter, the clear solution is very gradually poured into the solution of sulphate of iron in the basin, the whole being kept constantly stirred, and every now and again a drop of the iron solution is taken out and placed on a new drop of ferridcyanide of potassium placed on a white plate; and whenever the iron solution ceases to produce a deep blue, and only forms a light greenish-yellow tint, it is known that the iron has been fully oxidized by the chlorine. Suppose that at this stage the burette has been emptied to the 55th division; as we know that the liquid poured out must have contained 10 grains of chlorine, we can calculate the chlorine contained in the whole; for

$$55 : 10 :: 100 : 18{\cdot}18.$$

Thus 50 grains of the powder contain 18·18 grains of chlorine, or 36·36 per cent. Protochloride of manganese, subchloride of mercury (calomel), or a solution of indigo of known strength, may be employed instead of the sulphate of iron; but the latter is preferable, and is generally employed by chemists and manufacturers.

CHLO'RINE (Gr. *chloros*, pale green) is a non-metallic element discovered by Scheele in 1774, and named by him *dephlogisticated*

marine air. Afterwards, in 1810, Davy proved it to be an elementary body; and gave it the name which it now bears. In nature it is always found in a state of combination. United with sodium (Na), it occurs very largely as the chloride of sodium (NaCl)—common salt—in the ocean; in large beds, as rock-salt; in all natural waters, including even rain-water; in clays, soils, limestone; in volcanic incrustations; and in the vegetable and animal kingdoms. The preparation of gaseous C. by its liberation, directly or indirectly, from common salt, has been fully described under BLEACHING POWDER, which is the form in which C. is prepared and employed commercially. For experimental purposes, the gas may be received in jars filled with water at the pneumatic trough, when the C. rises into the jar, and displaces the water. When thus obtained, it is a yellowish-green gas with a peculiar and suffocating odor, is not combustible, and a very feeble supporter of ordinary combustion. A lighted candle placed in it burns with a very smoky flame, owing to the hydrogen of the oil alone burning, and the carbon being liberated. Several of the metals, such as antimony, copper, and arsenic, in a fine state of division, or in the condition of thin leaves, at once become red hot, and burn when introduced into the gas. A piece of thin paper soaked in turpentine likewise bursts into flame. C. has the symbol Cl, and the atomic weight or equivalent of 35·5. It is a very heavy gas, nearly 2½ times heavier than air, its specific gravity being 2470 (air = 1000); it is soluble in cold water to the extent of two volumes of C. in one of water, and yields a solution resembling the gas in color, odor, and other properties. The principal properties of C. are those of a bleacher of cotton and linen (see BLEACHING), and a most powerful disinfectant (q. v.). The gas can be condensed by pressure and cold into a transparent dark greenish-yellow limpid liquid, with a specific gravity of 1330 (HO = 1000), which also possesses bleaching properties, and a most powerful odor. On the animal system C. acts, in very minute quantity, by producing a sensation of warmth in the respiratory passages, and increasing the expectoration; in large quantity, by causing spasm of the glottis, violent cough, and a feeling of suffocation. The workmen in chemical manufactories, who get accustomed to the C. in small quantity, are generally stout—at least, lay on fat—but complain of acidity in the stomach, which they correct by taking chalk, and also suffer from the corrosion of their teeth, which are eaten away to stumps The antidotes to the evil effects of the introduction of C. into the lungs are the inhalation of the vapor of water, alcohol, ether, or chloroform; but the two latter should never be resorted to except under medical supervision.

C. unites with the metals and many other substances to form an extensive class of salts known as *chlorides*.

CHLO'RITE (Gr. *chloros*, green), an abundant mineral, consisting of silica, alumina, magnesia, and protoxide of iron, in somewhat variable proportions. It is of a green color, rarely occurs crystallized in hexagonal crystals, sometimes foliated like talc. It is rather soft, and is easily broken or scratched with a knife. Before the blowpipe, it is with difficulty fused on thin edges. It is readily distinguished from talc by yielding water in a closed tube.

CHLO'RITE-SCHIST, or CHLORITE-SLATE, a green slaty rock, in which chlorite is abundant in foliated plates, usually blended with minute grains of quartz, and sometimes with felspar or mica.

CHLO'RODYNE is a patent or quack medicine of considerable popularity, invented by a Dr. Collis Browne, but largely imitated by various chemists. It contains opium, chloroform, prussic acid, and probably Indian hemp, and is flavored with sugar and peppermint. As it is apt to separate into two liquids on standing, it should never be taken unless it has previously been well shaken; and as, in taking a dose of chlorodyne, the patient swallows an unknown quantity of three or four of the deadliest poisons with which we are acquainted, it is always advisable to begin with small doses. It is unquestionably a compound which sometimes succeeds in allaying pain and inducing sleep, when opiates have failed; but whether a physician is justified in recommending a remedy with the composition of which he is unacquainted, is a doubtful question. Ten or fifteen drops is the average dose.

CHLO'ROFORM, or the TERCHLO'RIDE OF FO'RMYLE (C_2HCl_3), was originally discovered by Soubeiran, and experimented upon by Dumas, and was long known only to scientific chemists as a rare organic body, possessing interest from being one of a series of organic substances, but not known to possess any properties likely to call it into use, or even likely to let it be known by name to the general public. The remarkable power, however, which it possesses of producing anæsthesia, has led to the preparation of C. on a very extensive scale. The materials employed are alcohol, water, and bleaching powder, and the proportions are four parts of bleaching powder, to which sufficient water is added to make a thin paste, and thereafter one part of spirits of wine; the whole is introduced into a capacious retort, which must not be more than half filled, and heat being applied, the C., accompanied by water and a little alcohol, distils over. As the C. is heavier than water, and is not readily miscible therewith, two layers of liquid are obtained in the receiver—the upper being water and alcohol, and the lower being chloroform. The upper liquid being cautiously poured off, the C. is agitated with fused carbonate of potash, which abstracts the remaining traces of water, and on subsequent redistillation the C. is obtained pure and ready for use.

C. is a highly limpid, mobile, colorless liquid, which is very volatile, has a characteristic and pleasant odor, and an agreeable sweetish taste. It has a specific gravity of nearly 1500 (water = 1000), being thus half as heavy again as water, and boils at 140° F. It is not inflammable in the ordinary sense of the term, as it will not take fire when a light is brought down upon it; but when thrown on red-hot coals, it burns with a green flame, evolving much smoke. It is slightly soluble in water, but more readily mixes with alcohol and ether. It dissolves camphor, amber, copal, and other resins, wax, caoutchouc, black and red sealing wax, iodine and bromine, as well as strychnine and other alkaloids. Its purity may be determined by placing some on the palm of the hand, and allowing it to evaporate, when no alcoholic or other odorous substance should be even momentarily recognized; and by agitation with oil of vitriol, when, on settling, the C. should readily swim on the surface of the vitriol, and the two layers of liquid remain colorless. The employment of C. as an anæsthetic has already been considered under ANÆSTHESIA; but it may be here repeated, that C. is a substance that cannot be too cautiously dealt with, and that it should never be administered except in the presence and by the sanction of a medical practitioner. When skilfully given, it is among the safest of all anæsthetics, and the greatest boon that chemistry has bestowed on suffering humanity.

CHLO'ROPHYLL (Gr. *chloros*, green, and *phyllon*, a leaf), the substance to which the leaves and other parts of plants owe their green color. It is somewhat analogous to wax, is soluble in alcohol and ether, but insoluble in water, and floats in the fluid of the cells, in the form of minute granules. Light is indispensable to its formation, and hence arises the familiar phenomenon of Blanching (q. v.), either from accidental causes, or by the art of the gardener. Young leaves do not exhibit so deep a green as those which have been longer exposed to the light; and the green of a leaf generally deepens till it begins to change into the tints of autumn. *Hydra viridis*, and other minute animals, appear to owe their green color to a substance analogous to chlorophyll.

CHLO'ROPS. See CORN-FLY and WHEAT-FLY.

CHLORO'SIS (Gr. *chloros*, pale green), a peculiar form of anæmia or bloodlessness, common in youngwomen, and connected with the disorders incident to the critical period of life. It has been called the *green sickness*, from the peculiar dingy greenish-yellow hue of the complexion; the green color, however, is not always characteristic. The disease is attended with very great debility, and often with breathlessness, palpitation, and other distressing, or even alarming symptoms. When there is no organic disease present, however, C. may be pronounced curable in a large proportion of cases.

The principal means to be employed are air, exercise, often salt-water baths, the use of iron, with a nutritious and rather stimulating diet, and purgatives if required; together with such special remedies as are adapted for restoring deficient secretions, and bringing the entire female system of organs into a natural condition.

CHLORO'SIS, a diseased state of plants, in which a sickly green or greenish-yellow color takes the place of the natural lively hue. Sometimes only a particular shoot is affected by it, but very generally the whole plant; and it seems to depend upon causes which render the plant altogether unhealthy, the pallid appearance being merely symptomatic, and not only the formation of chlorophyll, but all the functions of vegetable life being languidly and imperfectly carried on. Bad seed, damp soil, and cold wet weather, appear to be the most common causes of chlorosis. Plants affected by this disease are often to be seen among crops generally healthy; but whole crops of grain, potatoes, &c., sometimes perish from it, or are much diminished in value. Fruit-trees also suffer from it.

CHOCARD, or CHOQUARD (*Pyrrhocorax*), a genus of birds of the Crow family (*Corvidæ*), differing from the Choughs in having a shorter bill, which, however, is arched like theirs, but resembling them in their habits. The only European species is the Alpine C., also called Alpine Chough, and Alpine Crow (*P. Pyrrhocorax*). It is about the size of a jackdaw, of a brilliant black, with yellowish bill and red feet.

CHOCKS are pieces of wood employed on ship-board to aid in the support of various articles. Amongst them are anchor-chocks, rudder-chocks, boat-chocks, stow-wood chocks, and chocks to support the ends of the beams.

CHO'CO, a bay and province of New Granada, in South America. —1. The bay, forming part of the Gulf of Darien, receives the Atrato (q. v.), a stream of note in connection with inter-oceanic

communication. Its lat. and long. are about 3° 30′ N., and 77° 30′ W.—2. The province forms the west portion of the department of Cauca (q. v.).

CHO'COLATE is made from the seeds of *Theobroma Cacao* (see Cocoa), reduced to a fine paste in a heated iron mortar, or by a machine, and mixed with pounded sugar and spices, as cinnamon, cloves, cardamom, vanilla, &c. The paste is then poured into moulds of white iron, in which it is allowed to cool and harden. C. is sometimes made without spices, but it is then more generally called Cocoa. The paste is sometimes mixed with flour, and with Carrageen or with Iceland Moss; and for medicinal purposes with cinchona, &c. C. is used as a beverage, and for this purpose is dissolved in hot water or milk. Sometimes the yolk of an egg is added, and sometimes it is dissolved in soup or wine. It is also employed in making certain liqueurs. In a pure state, it soon satisfies the appetite, and is very nourishing; when it contains spices, it is also stimulating.

Good C. is externally smooth, firm, and shining—not gritty in the fracture—easily soluble, aromatic; not viscid after having been liquefied and cooled, but oily on the surface, and leaves no sediment of foreign substances. C. is adulterated in many ways, by mixing it with rice-meal, oatmeal, flour, potato-starch, roasted hazel-nuts or almonds, and with benzoin, storax, &c., in place of vanilla. The Mexicans, from time immemorial, were accustomed to prepare a beverage from roasted and pounded cocoa, dissolved in water, and mixed with maize-meal and spices. This they called Chocolatl (*choco*, cocoa, and *latl*, water). From the Americans, the Spaniards derived an acquaintance with C., and by them it was introduced into Europe in 1520. C. is used in South America, Spain, and Italy, more than in other parts of the world, although it is used to a considerable extent in Germany. Its use in Britain has given place in a great measure to that of the simpler cocoa.

CHOCOLATE ROOT. See Geum.

CHOIR (Lat. *chorus*). In its literal sense, the C. is the portion of the church devoted to the singers; and in all descriptions which concern the ritual it is so limited, including only the space from the western door or screen to the end of the stalls, whilst the part from the stalls eastward to the high-altar is called the presbytery. But in ordinary language, and even as used by architects, it denotes the entire space which is enclosed for the performance of the principal part of the service. In this sense, it includes the C. proper and the presbytery, and corresponds to the chancel in parish churches. Where the church is cruciform, and the term is confined to the eastern limb, it comes to be entirely different from the C. in the ritual sense, or the stall-place, which in such a building is commonly situated either under the tower or in the nave. In large churches, the aisle generally runs along each side of the C., and frequently passes across the east end of it; an arrangement which is very common in the larger churches of the continent which have polygonal or semicircular terminations.—C. is also the name given to the singers of the choral service.

CHOIR-SCREEN, or CHOIR-WALL, the screen or wall which divides the choir and presbytery from the side aisles. It is often very richly ornamented.

CHOISEUL-AMBOISE, Etienne François, Duc de, minister of Louis XV., was born June 18, 1719, educated by the Jesuits, and on the completion of his studies, entered the army. He fought bravely in the Austrian Wars of Succession; but only after he had attracted the fancy of the king's mistress, Madame Pompadour, did fortune also really favor him. Through the influence of Madame Pompadour, he was made lieutenant-general in 1748, ambassador to the courts of Rome and Vienna in 1756, and Duc de Choiseul in 1758. C. now became instrumental in bringing about a family league of the Bourbon monarchs in Europe; and in 1763, at the close of the war so disastrous to the French arms, he obtained, by his prudence and dexterity, milder terms for his nation than had been expected.

This made him very popular, as did also his successful attempt to overthrow the Jesuits. In 1764, Madame Pompadour died, but the power of C. continued unabated. He conceived, and almost carried out, a plan for the formal emancipation of the Gallican Church from papal influence, paid great attention to the improvement of the army and navy, developed the trade and industry both of the nation and of the colonies, and opened up anew an intercourse with India, whose native princes were assisted by French officers in their endeavors to expel the British from the peninsula. He had spies in every European court, and so ruled all diplomatic and political cabals, that the Empress of Russia, who dreaded him, called him *Le Cocher de l' Europe* ('The Driver of Europe'). But the rise of Madame Dubarry, who succeeded Madame Pompadour in the royal affections, gradually alienated Louis from his able minister, and in 1770 he retired to his magnificent estate of Chanteloup, where he lived in princely splendor. After the accession of Louis XVI., C. received permission to return to Paris. He was often consulted, but never recovered his official position. He died May 7, 1785.

CHO'KE-CHERRY, a name given to a certain nearly allied species of Cherry (q. v.), of the Bird-cherry section of the genus or sub-genus, natives of North America, having small fruit in racemes, and the fruit at first rather agreeable, but afterwards astringent in the mouth. Some confusion has long existed as to the different kinds, and their botanical names (*Prunus* or *Cerasus Virginiana*, *serotina*, and *borealis*) are not more determinate than the popular ones. Perhaps they ought to be regarded as mere varieties rather than distinct-species. They have a considerable resemblance to the Portugal Laurel, although the leaves are deciduous. The bark is used as a febrifuge and tonic, under the name of *Wild Cherry Bark;* and by distilling it with water, a volatile oil is obtained from it associated with hydrocyanic acid, called *Oil of Wild Cherry*. This bark allays nervous irritation, and is particularly suitable as a first tonic in cases of recovery from fever or inflammation.

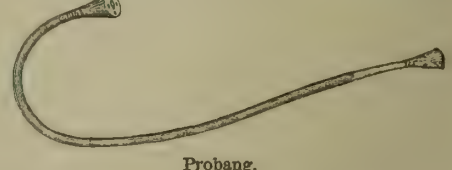
CHO'KE-DAMP. See Carbonic Acid.

CHOKING, the obstruction of the gullet, or of the passage leading to it, by morsels of food imperfectly chewed, or other substances accidently swallowed. The consequences of C. in the human subject are serious, and will be best considered in connection with the parts concerned. See Pharynx and Œsophagus. What follows relates to the C. of cattle.

Causes.—These may be classified under two heads: 1. Those that depend on the material swallowed; and 2. Those that depend on the animal swallowing. Under the first head we find sharp-pointed objects which become fixed into or entangled in the membrane lining the throat and gullet; solid masses too large to pass on to the stomach; dry farinaceous materials which clog in the passage. The second class of causes consists in inflammation of the throat, or irritation of the organs of deglutition; constrictions of the passage, as in crib-biting horses; ulceration of the œsophagus, which is apt to run after C., and is the cause of a relapse; lastly, without any disease of the deglutating organs, an animal may be choked by eating too greedily, and imperfectly masticating or salivating its food.

Symptoms.—These vary according to the position of the obstruction. If high up in the pharynx, the animal cannot swallow, evinces great distress, and attempts to cough up the object. Saliva drivels from the mouth, the animal chews, and makes an occasional ineffectual effort to swallow. The breathing is very greatly disturbed. In some cases a large lump of food has become fixed in the larynx or upper part of the windpipe, and has suddenly suffocated the animal. When the obstruction is in the course of the gullet down the neck, the symptoms are very similar, though less urgent, and there is additionally the local sign of swelling, with the peculiar hardness or softness of the substance indicating its nature. When an animal is choked by a substance lodging in the gullet within the chest, the symptoms are more mysterious, and likely to mislead. The animal swallows; a considerable quantity of liquid may enter the gullet, but it is suddenly regurgitated or thrown up, as in the act of vomiting. The distress is great: and in the course of three or four days, unless the animal is relieved, it dies of prostration. In the ox, sheep, and goat, the most alarming symptoms, in any case of C., arise from the paunch becoming distended by gas. This condition will be treated under the head Hoven.

Treatment.—Remove the obstruction with the hand, when you can. Cause the animal to swallow the substance, if possible, by



Probang.

giving it water or oil. Carefully push the offending agent down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases, the gullet has to be cut into by a qualified surgeon. After a case of C., keep the animal on soft food, and attend to its general health, in order to avoid a relapse, which is of frequent occurrence in cattle.

CHO'LERA, a Greek term used in the Hippocratic writings, but of indeterminate etymology, being derived perhaps from *chole*, bile, or from *cholera*, a water-spout or gutter. It is now universally employed in medicine as indicating one of two or three forms of disease, characterized by vomiting and purging, followed by great prostration of strength, amounting in severe cases to fatal collapse. The variety called *cholera sicca* (dry C.) by ancient writers (in which collapse and death take place without discharges) is comparatively rarely observed. The milder forms of

C. occur almost every summer and autumn, even in temperate latitudes, and are hence termed by some—in reference to this country, and by way of contrast—British or Summer C.; while the more devastating and fatal forms of the disease are generally supposed to originate only in tropical countries—especially in India—and thence to be propagated epidemically over vast populations, and in a somewhat regular geographical course, reaching this country usually through Persia, the steppes of Tartary, Russia, and the Baltic, at the same time extending to Egypt, Turkey, and the south of Europe. These very fatal forms of the disease are commonly called Asiatic, Oriental, or Epidemic C.; sometimes Cholera Morbus, or Pestilential Cholera. The milder forms are sometimes also called Bilious C.; and the severer, Spasmodic C., form the character of the symptoms in each. Some writers of great authority are inclined to consider the two forms as one disease, varying in individual cases and according to season. It is certain that it is not always possible to distinguish the one form from the other in particular instances; but the marked differences between the mortality of groups of cases of British C., on the one hand, and of Oriental or Asiatic C. on the other, renders it probable that there is something in the latter disease which amounts to a distinction in kind. Whether in the milder or severer form, C. is usually ushered in by a period of premonitory symptoms, when the more distinctive characters of the disease are not established, the case resembling one of common diarrhœa (q. v.) or looseness of the bowels. At this stage, it is very apt to be neglected, and unfortunately, in the severer epidemic forms of the disease, this is the only stage much under control. Whenever therefore, there is a reasonable suspicion that Epidemic C. is threatened, every person attacked with diarrhœa should make a point of placing himself under medical advice, and, if possible, of escaping from any situation in which epidemic disease is known to be prevalent. He should also be more particularly attentive to diet, and especially to the purity of the water he drinks, and to its absolute freedom from contamination by animal matters filtering through the soil, or thrown into water-courses by sewers, &c. If water cannot be had in a pure state, it should be boiled before being used for drink, or indeed for any domestic purpose.

Many cases of C., and several local epidemics, have been traced in the most positive manner to organic impurities of the drinking-water; and no single cause of the disease has been established by so much evidence as this. Hence, in all probability, arises the well-known preference of C. for low situations, and particularly for the low-lying flats on the banks of rivers, especially where the inhabitants are supplied with water from streams polluted by sewerage, and wells into which the contents of drains are permitted to filter from a superior elevation. The researches of the French and German Scientific Commissions, sent to Egypt during the severe epidemic of 1883, seem to prove that C. is due to the presence and growth of a specific bacillus or bacterium (see GERM THEORY).

It is hardly within the scope of a work such as this to present a minute description of fully developed C. in its severer or Asiatic variety. It is truly an appalling pestilence,* too easily recognized by a few leading features. After some hours or days of simple relaxation of the bowels, vomiting commences, and occurs again and again, accompanied by frequent and extremely copious discharges downwards, at first of matters colored with bile as usual, but in the end of colorless and turbid fluid resembling water in which rice has been boiled. These discharges (often to the extent of gallons of liquid), succeeding each other with the most alarming rapidity, act as a drain upon the fluids of the body generally; and by the changes they effect upon the blood, contribute to bring about the state called *collapse*. In this condition, the patient lies motionless and apathetic, except when tormented by cramps, which are of frequent occurrence; the surface is cold; the finger-ends, lips, and tip of the nose become livid; the eyes are deeply sunk in the sockets, and often bloodshot; the tongue is clammy; the breath without any sensible warmth when caught on the hand; the pulse is suppressed at the wrist, the breathing extremely slow and feeble, the heart just audible through the stethoscope. Purging and vomiting have ceased; even the urinary secretion is dried at its source. In fact, all the vital processes are nearly brought to a stand, and unless reaction comes, a few minutes, or at most a few hours, suffice to bring life to a close. Reaction in the most favorable cases is gradual and without accident; it is not unfrequently, however, accompanied by fever, closely resembling typhus, and constituting, at least in the temperate zone, one of the chief dangers of the progress of cholera.

Medicine is almost powerless against C., except in the earliest stages, in which the treatment usually pursued in diarrhœa (q. v.) has sometimes been found useful. Very remarkable temporary restorative effects have been found to follow the injection into the veins of dilute solutions of saline matter, resembling as nearly as possible the salts of the blood, which are drained away in the discharges. Unhappily, these experiments have as yet only very imperfectly succeeded. The patient is restored to life, as it were, from the very brink of the grave; but he revives only for a few hours, to fall back into his former condition.

The true medicine of C., so far as we yet know, is preventive medicine. The measures to be adopted have been partly pointed out above; in addition, it may be said that personal cleanliness is of the first importance; and that all unnecessary contact with the sick should be avoided, as the disease is probably to some extent contagious, though by no means in the highest degree. In short, all the precautions are to be taken which are recommended in the case of epidemic disease (q. v.).

CHOLE'STERINE is one of those bodies which are termed by chemists lipoids, or non-saponifiable fats. It was originally discovered in gall-stones, but is now recognized as an ordinary constituent (although occurring in very minute quantity) of bile, blood, and the tissue of the brain. It likewise occurs in pus, the contents of cysts, and other morbid fluid products.

It separates from its solutions in glistening nacreous scales, which, when examined under the microscope, appear as very thin rhombic tablets, whose obtuse angles are 100° 30′, and whose acute angles are 79° 30′. Different formulæ have been assigned for its composition, the one generally accepted being $C_{27}H_{22}O$. It is not always very easy of detection in animal fluids, but if, by its insolubility in water, acids, and alkalies, and its solubility in hot alcohol and ether, it has been recognized as a fatty substance, it may be readily distinguished from all similar substances by the measurement of the angles of its rhombic tablets. The best method of preparing C. is by boiling gall-stones containing it in alcohol, and filtering the solution while hot. From this hot filtered solution it crystallizes as the fluid cools.

Chemists have obtained substances known as *cholesterilins* and *cholesterones* from the decomposition of cholesterine.

CHOLET, a town of France, in the department of Maine-et-Loire, on the right bank of the Maine, 32 miles south-west of Angers. Here, during the Vendean war, two actions were fought in 1793, in both of which the royalists were defeated. In the first, they lost their brave general Bonchamps; and the second drove them across the Loire, thus virtually deciding the war against them. It has manufactures of fine woollen and mixed fabrics, and leather, and a trade in cattle. Pop. (1876) 12,335.

CHOLU'LA, a once flourishing, but now decayed, town of Mexico, 60 miles to the east-south-east of the capital, and 15 to the west-north-west of La Puebla. Cortes found in it 20,000 houses, and as many more in the suburbs, and also 400 temples. Now the place contains only about 10,000 inhabitants. Its most remarkable memorial of aboriginal times is a pyramid of clay and brick, surmounted on the top by a chapel of Spanish origin. Its height is 177 feet, while the side of its base measures 480 yards. C. stands on the table-land of Anahuac, at an elevation of 6912 feet above the level of the sea.

CHO'NDA, a town of Gwalior, 18 miles to the north-west of the fort of the latter name, in lat. 26° 27′ N., and long. 78° E. It claims notice merely as the scene of a decisive victory gained by Sir Hugh, afterwards Lord Gough, over the Mahrattas, on 29th December 1843.

CHO'NDRINE. See GELATINE.

CHONDROPTERY'GII. See CARTILAGINOUS FISHES.

CHO'NETES, a genus of fossil brachiopodous mollusca, nearly allied to the well-known genus *Productus*. It is characterized by its transversely-oblong shell, and by having the long margin of the ventral valve armed with a series of tubular spines. Twenty-nine species have been described from the Palæozoic formations.

CHO'NOS ARCHIPELAGO, a group of islands off the W. coast of Patagonia, lat. 44°—46° S., long. 74°—75° W. With the exception of a few of the most westerly, all are bare and scantily peopled, though several are of considerable extent.

CHOPIN, FRÉDÈRIC, a distinguished Polish pianist and musical composer. He was born at Zelazowa-wola, near Warsaw, in 1810, and studied music at Warsaw under Professor Joseph Elsner. An exile after the revolution of 1830, he took up his residence in Paris, where he lived admired both professionally and in society. His health, always delicate, broke down in 1837, when he went for a time to Majorca, from which he afterwards returned, benefited by the change. After again suffering much from illness and depression of spirits, he visited England and Scotland in 1848, and in London was welcomed with enthusiasm in public and private. He never recovered from the fatigues of this journey, but died in Paris, 17th October 1849, and was buried, by his desire, beside Bellini, in the cemetary of Père-la-Chaise. His compositions, restricted to pianoforte music, are in high esteem among musicians, and consist chiefly of preludes, nocturnos, polonaises, mazurkas, and valses, with a few concertos and sonatas. They are pervaded by a sensitive, restless, and highly poetic fancy, and abound in subtle ideas, graceful and original harmonic effects, and rich ornamentation. The so-called polonaises, mazurkas, and valses are

* The epidemic of 1848—1849 carried off 53,293 persons in England and Wales: and that of 1854, 20,097 persons. The next visitation was in 1866. In Egypt, in 1883, the C. carried off 55,000 persons. Probably twice as many deaths were not registered.

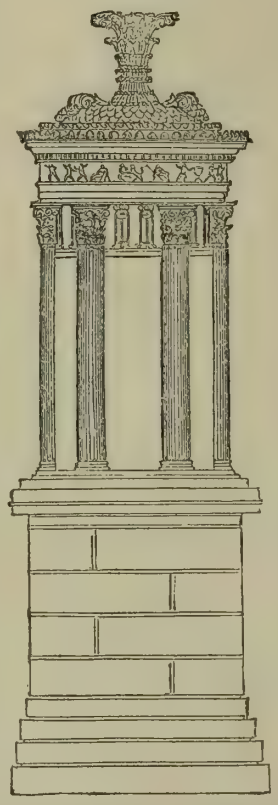
not dance music, but dreamy compositions suggestive of the rhythm and character of these dances, in which the peculiarities of Polish national music are blended with French elegance and taste.

CHO'PIN (Scotch, *chappin*), the name of a Scotch liquid measure equivalent to the English quart.

CHO'PINE (Spanish, *chapin*), a high clog, or slipper, deriving its name, as is supposed, from the sound *chap, chop*, made by the wearers in walking. Chopines were of Eastern origin, but were introduced into England from Venice during the reign of Elizabeth. They were worn by ladies under the shoes, and were usually made of wood covered with leather, often of various colors, and frequently painted and gilded. Some of them were as much as half a yard high; and in Venice, where they were universally worn, their height distinguished the quality of the lady. The C. is mentioned by Shakspeare in *Hamlet*. The accompanying representation of a C. is copied from Douce's *Illustrations of Shakspeare*.

Chopine.

CHORA'GIC MONUMENTS. The choragus or person at Athens who, on behalf of his tribe, had supported the chorus (q. v.), and who, in competition with the other tribes, had exhibited the best musical or theatrical performance, received a tripod for a prize; but he had the expense of consecrating it, and of building the monument on which it was placed. There was at Athens a whole street formed by these monuments, called the 'Street of the Tripods.' The figure represents the monument of Lysicrates, popularly known as the 'Lantern of Demosthenes.'



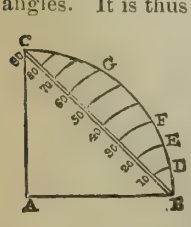
Choragic Monument of Lysicrates in Athens, restored.

CHO'RAL MUSIC, the ancient music of the church. Music in parts for different voices. See SACRED MUSIC.

CHORAL SERVICE, the musical service of the English Church, celebrated by a full complement of clergymen and choristers in a cathedral church, and when all those parts of the service are sung as ordered in the rubrics.

CHORA'LE, a musical term adopted from the German, means a melody to which sacred hymns or psalms are sung in public worship by the whole congregation in unison. The melody of the C. moves in notes of a slow and strictly measured progression, and of a solemn and dignified character that disposes the mind to devotion. Although the term C. is now always applied to the music of the Protestant Church, it belonged to the Christian Church at all times, as melodies still in use can be traced with certainty to have been sung by the congregations in the first centuries of Christianity. Among these is the song of praise by St. Ambrose, still retained in the Lutheran Church, to the words 'Herr Gott, dich loben wir.' The C. is intimately connected with the history of music, as vocal music was the only kind used in worship until far on in the middle ages. The C. is precisely what our psalm-tune is, or rather what it formerly was, and ought again to become. The pure, simple C. has, in a great degree, been cast aside in the British Isles, and its place occupied by tunes of a comparatively puerile style, which are frequently only adaptations of operatic songs and other profane pieces.

CHORD. The C. of an arc of a curve is a straight line joining its two extremeties. A SCALE OF CHORDS is used in laying off angles. It is thus constructed: Let AB be the radius of the circle to which the scale is to be adapted. With center A and radius AB describe a quadrant BEC. Divide the quadrantal arc BEC into nine equal parts BD, DE, &c. This may be done by taking a radius equal to AB, and from the centers B and C cutting the arc in G and F. As the radius is always equal to the chord of 60° or ⅔ of a quadrant, the arc CB is thus divided into three equal parts, BF, FG, GC, and each of these parts may then be trisected by trial, as no direct method is known. Draw the chord of the quadrant BC; from B as a center, and the chord of BD as a radius, describe an arc cutting BC at 10; with the chord of BE as a radius, describe an arc cutting BC in 20; with the chord of BF, describe an arc cutting BC in 30; and in a similar manner, find the divisions 40, 50, 60, 70, 80. Then the arcs BD, BE, BF, being arcs of 10°, 20°, 30°, &c., respectively, the distances from B, to 10, 20, 30, &c., are the chords of arcs of 10°, 20°, 30°, &c.; so that BC is a scale of chords for every 10°, from 0° to 90°. To lay down or measure angles with such a scale, the arc of measurement must be described with the chord of 60°.



CHORD, in Music, is the simultaneous and harmonious union of different sounds, at first intuitively recognized by the ear, and afterwards reduced to a science by the invention of the laws or rules of harmony. See HARMONY. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord, or *Trias harmonica perfecta*, is the basis of all harmony, and consists of a bass note, or prime, with its third and fifth above, thus: . These three sounds are at the distance of a third from each other. When the lowest third is the greater third, as above, the C. is a major chord; but when the lowest third is the lesser, thus:  , the C. is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than a perfect fifth, thus:

The common C. admits of two inversions, according as one or other of its notes is made the bass, or lowest note of the C., thus:

Fundamental Chord. 1st inversion. 2d inversion.

By adding another third above the common C., a C. of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the C. of the seventh is produced on the fifth of the scale, it is then called the dominant seventh, which is the most perfect species of the C. It then consists of a major third, perfect fifth, and seventh, the minor, which is the next harmonic produced by nature, above the fifth. The C. of the seventh may also be formed on any of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished sevenths, thus:

Dominant 7th. Major 7th. Minor 7th. Diminished 7th.

The C. of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common C. whose fundamental bass is a fifth below that of the seventh. For the C. of the ninth, see HARMONY. The first proper arranged system of chords is by Rameau, in 1720, which has from time to time been extended and improved by Marpurg, Kirenberger, G. Weber, F. Schneider, Marx, and the late Professor S. W. Dehn of Berlin.

CHORE'A (Gr. *choreia*, a dancing or jumping), a disease popularly called St. Vitus's Dance, and consisting of a tendency to involuntary and irregular muscular contractions of the limbs and face, the mind and the functions of the brain generally being quite unaffected. The spasms of C. differ from those of most other convulsive affections in being unaccompanied either by pain or by rigidity; being, in fact, momentary jerking movements, indicating rather a want of control of the will over the muscles, than any real excess of their contractions. In some cases the disease resembles merely an exaggeration of the restlessness and 'fidgetiness' common among children; in others, it goes so far as to be a very serious malady, and may even threaten life. Fatal cases, however, are fortunately very rare, and in the large majority of instances the disease yields readily to treatment carefully pursued, or disappears spontaneously as the patient grows up. C. is a dis-

ease much more common among children of six years old, and upwards, than at any other period of life: it is also more common among female children than among males. The treatment generally pursued is the use of metallic tonics, such as zinc, copper, iron, and arsenic (the last, perhaps, the best), sometimes preceded or accompanied by purgatives. Exercise in the open air is also to be recommended; and gymnastics afford material aid in the cure. It is to be observed that the name St. Vitus's Dance (Dance of St. Weit) was applied originally in Germany to a different form of disease from that above referred to—one closely approaching in its characters the epidemic 'dancing mania,' which, in Italy, was called Tarantism (q. v.).

CHO'RLEY, a town in Lancashire, on a hill on the Chor, 9 miles south-south-east of Preston. It has an ancient parish church, supposed to be of Norman origin, and manufactures of cotton-yarn, jaconets, muslins, fancy goods, calicoes, and ginghams. In the vicinity are several coal-mines, a lead-mine, besides mines and quarries of iron, alum, slates, millstones, &c. Pop. (1881) 19,472.

CHO'RUS, among the ancients, meant a band of singers and dancers employed on festive occasions of great pomp, and also in the performance of tragedy and comedy on the stage. In the time of the Attic tragedy, the C. consisted of a group of persons, male and female, who remained on the stage during the whole performance as spectators or rather as witnesses. When a pause took place in the acting, the C. either sang or spoke verses having reference to the subject represented, which served to increase the impression or sensation produced by the performers. At times, the C. seemed to take part with or against the persons in the drama, by advice, comfort, exhortation, or dissuasion. In early times, the C. was very large, sometimes consisting of upwards of fifty persons, but afterwards it was much reduced. Its leader was termed the Coryphæus. The charge of organizing it was considered a great honor among the citizens of Athens. The person appointed for this purpose was called the *choragus*.

The honor was very expensive, as the choragus had to pay all the expenses incurred in training the members of the C. to perform their parts efficiently. They were, besides, fed and lodged by him during the training-time, and he had also to provide for them masks and dresses. At times, the C. was divided, and spoke or sang antiphonally. These divisions moved from side to side of the stage, from which movement originated the naming of the single songs or stanzas, such as Strophe, Antistrophe, and Epode. How the musical element of the ancient C. was constituted or composed, is not known with any certainty. Possibly, it was only a kind of rhythmical declamation, and doubtless very simple. It was accommpanied by flutes in unison. With the decline of the ancient tragedy, the C. also fell into disuse; and only lately has there been an attempt to produce the same on the stage in the manner of the ancients, as, for example, in Schiller's *Bride of Messina*. The music which has been set in modern times to some of the Greek tragedies, does not give the least idea of the original music.

In modern times, by C. is understood the union of singers or musicians for the joint performance of a musical work. C. is also the name given to a musical composition for numerous voices, either with or without accompaniment, and intended to express the united feelings of a multitude. The musical C. is the only artistic means by which a simultaneous movement or sentiment of a multitude can be represented in the drama, the language or text being always of a simple rhythm, permitting only of a limited movement suited to the combination of a multitude. It is, however, not always necessary that every part of the C. should manifest the same feeling or sentiment. Two or more parts of the C. may act against each other, as suits the purport of the drama. Double, triple, and quadruple chorusus are found in the old Italian compositions for the church. In modern times, the C. is much used, and with great effect, in operas, especially those of Meyerbeer and Wagner. In the oratorio, the C. is of the greatest importance, and the numbers now employed to sing the C. far exceed anything attempted a century ago; but this is not always an advantage, for the *tempi* must necessarily be taken much more slowly, which has a sluggish effect; while increase in the number of voices does not always produce a greater power of sound. The C. of thirty-five well-trained voices from the pope's chapel, who sang at the coronation of Napoleon I., in the cathedral of Notre Dame, Paris, produced a far greater and more wonderful effect when they entered singing the *Tu es Petrus*, than another C. of hundreds of voices and eighty harps, that had been assembled and trained for the same occasion, in expectation of surpassing all that man could imagine. The greater the number, the greater is the difficulty in obtaining unity—C., in organ-building, is the name given to stops of the mixture species, some of which contain 2, 3, 4, 5, 6, or more pipes to each note, tuned at consonant intervals in relation to the fundamental stops.

CHOSE IN ACTION, in the law of England, is that kind of property which consists not in possession, but in legal right to possess. As this right can, in general, be vindicated and made available only by means of an action, the property to which it relates, whether real or personal, is called a thing (*res* or *chose*) in action, to distinguish it from a thing already in possession. Money due upon bonds and bills, goods bought and not yet delivered, are examples of choses in action, as is also the right to compensation for damage occasioned by breach of contract. 'By the strict rule of the ancient common law, no chose in action could be assigned or granted over, because it was thought to be a great encouragement to litigiousness, if a man were allowed to make over to a stranger his right of going to law. [See CHAMPERTY.] But this nicety is now not so far regarded as to render such a transaction really ineffectual. It is, on the contrary, in substance, a valid and constant practice; though, in compliance with the ancient principle, the form of assigning a chose in action is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assigner, in in order to recover possession. . . . The king is an exception to this general rule, for he might always either grant or receive a chose in action by assignment; and our courts of *equity*, making the rule itself give way to the expediency, in a commercial point of view, of facilitating the transfer of property, allow the assignment of a chose in action as freely and directly as the *law* does that of a chose in possession.'—Stephen's *Commentaries*, ii. p. 45. One would imagine that the more convenient and philosophical arrangement would be, by the interposition of the legislature, to make law conform at once to equity and expediency.

CHO'TA NAGPO'RE, or NAGPORE THE LESS, one of the lower provinces of Bengal, containing five British collectorates, besides seven tributary minor states. The area of the British divisions is 28,482 square miles, and in 1871 the pop. was 3,419,591, consisting chiefly of aboriginal tribes who are little removed from barbarians. The country is for the most part wild and hilly, consisting of an undulating plateau 3000 feet above the sea. Its chief products are coal, jute, tea, and indigo; iron is also found. From the elevation of the tract, the temperature varies considerably, ranging in winter from 32° to 62°, and in summer from 78° to 98°.

CHOUANS were bands of insurgent Royalists, who, during the French Revolution, organized a reactionary movement in Brittany. They obtained their name from their leader, Jean Cottereau. This person, who had been a smuggler, went by the name of Chouan—a corruption, it is said, of *chat-huant* ('screech-owl')—because, while he and his accomplices were engaged in their nocturnal work, they were wont to be warned of their danger by some one on the watch imitating the cry of this bird.

At the period of the revolt, however, he followed the humble occupation of a clog-maker. The first indications of an anti-revolutionary spirit in Brittany manifested themselves in the beginning of 1791, when several trees of liberty were destroyed at night, and other more serious outrages committed. These disturbances were fomented by seditious priests. In 1792, an insurrection was planned by the Marquis de la Rouarie, with the sanction and approval of the two brothers of Louis XVI. The agents of the marquis entered into communications with Jean Cottereau—well known for the reckless audacity of his character—and other smugglers; but having the misfortune to be arrested, the carrying out of the insurrection devolved upon the latter. The *Chouanerie*, as the insurrection was called, at first disgraced itself, both by the drunken license and the cruelty which marked it. After several successful exploits of the guerrilla sort, Jean Cottereau perished in an engagement which took place on the 28th July 1794, near the wood of Misdon, the theater of his first efforts. Before this, however, other and more illustrious leaders had appeared in Brittany to direct the movement, the chief of whom were Georges Cadoudal (q. v.) and Charette. Through their endeavors it was more widely extended, and for a time seemed likely to imperil the security of France, but was suppressed towards the close of 1799. Petty *spurts* of insurrection, however, broke out till about 1803, when the *Chouanerie* ceased for awhile. In 1814–1815, it again made its appearance on both banks of the Loire; and after the July revolution, was once more excited by the Duchess of Berry on behalf of the Duke of Bordeaux, but crushed by the energetic measures taken by M. Thiers.

CHOUGH (*Fregilus*), a genus of birds of the crow family (*Corvidæ*), but approaching to the characters and appearance of the starlings (*Sturnidæ*). The length of the bill has induced some naturalists, among whom was Cuvier, to place them beside the hoopoes but this is now generally regarded as an error, they agree with crows in having their nostrils covered with stiff bristles directed forward, and in their habits. The beak is longer than the head, strong, arched, and pointed. The tail is slightly rounded.

The only European species is the common C., sometimes called the Cornish C., or Red-legged Crow (*F. graculus*), a widely dis-

tributed but very local bird, inhabiting the Swiss Alps, the high mountains of Spain and Greece, of India, and of Persia, the south of Siberia, the north of Africa, and some parts of the British seacoasts; but almost exclusively confined to situations where there are high cliffs. In these it generally makes its nest; sometimes, however, in ruined towers. Its long hooked claws enable it to cling easily to a rough rock, but it seems unwilling even to set its

Chough.

feet on turf. It lives in societies like the rook. It feeds on insects, berries, grubs, and grain. It is easily tamed, becomes very familiar and forward, and exhibits in the highest degree the curiosity, the pilfering disposition, and the delight in brilliant or glittering objects, which also characterize others of the crow family. —Other species of C. are known, natives of Australia, Java, &c. Some naturalists unite the chocards and the choughs into one genus.

CHOYA. See CHAY ROOT.

CHRISM (Gr. *chrisma*, ointment) is the name given to the oil consecrated on Holy Thursday, in the Roman Catholic and Greek Churches, by the bishop, and used in baptism, confirmation, orders, and extreme unction. There are two kinds of C.—the one, a mixture of oil and balsam, is used in baptism, confirmation, and orders; the other, which is merely plain oil, is used in extreme unction.

CHRI'SOME, the name of the white vesture laid by the priest on the child in former times at baptism, to signify its innocence. It was generaly presented by the mother as an offering to the church, but if the child died before the mother was 'churched' again, it was used as a shroud. By a common abuse of words, C. came to be applied to the child itself. A C. child is a child in a C. cloth. As late as Jeremy Taylor (*Holy Dying*, c. i., s. 2), we have the following: 'Every morning creeps out of a dark cloud, leaving behind it an ignorance and silence deep as midnight, and undiscerned as are the phantasms that make a chrisome child to smile.'

CHRIST, a title of our Saviour (see JESUS), now in general use almost as a name or as part of his name. It is originally Greek, signifies *anointed*, and corresponds exactly in meaning and use with the Hebrew word MESSIAH (q. v.); so that this title given to Jesus of Nazareth, is an acknowledgment of him as the Saviour long promised to the house of Jacob and to the human race. As prophets, priests, and kings were anointed on being called to their several offices (1 Kings i. 34, 39; 1 Sam. xvi. 13; Exod. xxix. 7), so the Saviour was anointed as at once prophet, priest, and king; the Holy Spirit, often represented under this figure, being given to him to qualify his human nature for all that belonged to his mediatorial office and work.

The whole system of Christianity depends on the doctrine of the PERSON OF CHRIST. An essential difference necessarily exists on almost every point between the systems of doctrine maintained by those who do and by those who do not acknowledge a union of the divine and human natures in his person. Some of the early heretics maintained an opinion, which has long ceased to have any supporters, that the body of C. was not a real body, but a mere visionary appearance. See DOCETÆ and GNOSTICS. The opposite extreme is that of Socinians, by whom C. is regarded as a mere man; whilst Arians (q. v.) regard him as in his *pre-existence*—i. e., before his *incarnation*—the highest of all created beings; and according to the generally received doctrine of Christians, he is 'God and man in two distinct natures and one person.' This doctrine, of course, bears a most intimate relation to that of the TRINITY (q. v.); and all who hold the divinity of Jesus Christ, regard him as the incarnate Second Person of the Godhead. The proof of the whole doctrine may almost be said to consist simply in a proof of the *divinity* of C.; his real *humanity*, although equally important, being no longer disputed. And this proof is found, not so much in particular texts which directly assert the divinity of C.—although such texts are important—as in the multitude of texts which imply it, and admit of no reasonable or natural explanation apart from it; and in showing that certain doctrines are taught in Scripture which cannot be maintained without this.

The ancient Apollinarians, Eutychians, Monophysites, &c., regarded C. as having only one nature—a *compound* of the divine and human; but such a notion as that C. had only a human body, the divine nature supplying the place of a soul, is held to be subversive of the whole Christian system; and his human nature, to be real, must be viewed as consisting both of a true body and a true soul. His human nature never existed, however, apart from his divine nature, and was 'conceived by the power of the Holy Ghost.'

Closely connected with this subject is that of the *humiliation* and consequent *exaltation* of C., in his character of mediator between God and man; a subject, to the former branch of which belongs the whole doctrine of the *work* of C. for the redemption of sinners, including the great doctrine of ATONEMENT (q. v.). To the latter belongs the doctrine of the reward of his work, in his sitting at the right hand of God, and having all things put under his feet; not only exercising dominion as king in his church, but over all things for the advancement of the salvation of his church, and of every member of it; while also he sends forth the Holy Spirit to apply to men the blessings which, as the reward of his work, He has mediatorially obtained for them; and still continuing to act as a priest, makes continual INTERCESSION (q. v.), founded upon his work and sacrifice.

CHRIST, ORDER OF, IN PORTUGAL. When the Templars were expelled from France, and their property confiscated by Philippe le Bel, with the sanction of Pope Clement V., they were received into Portugal, and their order revived in 1317, under the title of 'the Order of Our Lord Jesus Christ.' With some difficulty, Pope John XXII. was induced to sanction the new order. The Knights of the order of Christ joined the Portuguese in all their crusades against the infidel, and also in their African and Indian expeditions, receiving in compensation continual additions to their own possessions. The grand prior of the order was invested by Pope Calixtus III. with power equal to that of a bishop; and, as an encouragement to adventure, the knights were promised all

Badge of the Portuguese Order of Christ.

Star of the Portuguese Order of Christ.

the countries which they might discover, to be held under the protection of Portugal. At length, their wealth and power excited the jealousy of the kings of Portugal; their future acquisitions, and, subsequently, even their actual possessions, were declared to be crown possessions, and the offices of administrator and grand-master were transferred to the crown. A fine cloister belonging to the order is still to be seen at Tomar, to which place the seat of the order was transferred from Castro-Marino in 1366. Noble descent, and three years' military service against the infidel were required for admission. The members took the three monkish vows of chastity, poverty, and obedience, till the pope released them from the first two, on the condition of their applying the third part of their revenues to support of Tomar cloister, the priests of which were bound by the three vows. This cloister is now a theological institution for the instruction of the priests of the order.

It is said that the order still possesses 26 villages and farms, and 434 prebends. It is very numerous consisting of 6 knights of the Grand Cross, 450 commanders, and an unlimited number of knights. Catholics of noble descent alone are admitted, and foreigners are excluded from participation in the revenues, being

exempted in return from its rules. The star and badge of a Knight Grand Cross are represented in the illustration.

CHRIST, THE PAPAL ORDER OF. This is a branch of the Portuguese order, created by Pope John XXII. It has only one

Badge of the Papal Order of Christ.

class. The decoration and star are represented in the illustration.

CHRIST, PICTURES OF. To represent the form and countenance of C. in a manner that shall even approximate to the latent ideal in the minds of men, is unquestionably the most sublime and the most difficult work which an artist can undertake.

It is the highest pictorial effort of the creative faculty. From a very early period in the history of the church, we can trace the growth of the endeavor. At first, indeed, the horror entertained for the idols of the pagans, must have inspired Christians with an aversion to images or pictures of the Saviour. Gradually, however, as paganism disappeared, and time removed C. further from his people, this feeling would subside, and the longing would arise to possess some representation of him on which the eye might rest with pious delight. When Christian art originated we cannot precisely say; it is usually dated from the time of Constantine. Nevertheless—as Lord Lindsay remarks, in his *Sketches of the History of Christian Art* (Lond. 1847)—'it would be more correct to say that it then first emerged above ground; its earliest efforts must be sought for in the catacombs.' In these subterranean excavations, forming a maze of unknown extent and labyrinthine intricacy, to which the Roman Christians had recourse in the days

Supposed earliest Picture of Chirst:
From a Ceiling in the Catacombs of St. Calixtus at Rome.

of persecution, are to be found the first traces of Christian sculpture and painting. The *sarcophagi* of the martyrs and confessors, of the heroes and heroines, of the bishops, and, in general, of those of higher mark and renown, were painted over with the symbols and devices of Christianity. The parables were the chief source from which these sepulchral artists drew their symbols. C. is painted as the good shepherd in the midst of his flock, or, with 'pastoral pipe,' seeking the lost sheep, or returning with it on his shoulders. Sometimes he figures as an ideal youth in the bloom of his years, sometimes as a bearded man in the prime of life, sometimes as Orpheus surrounded by wild beasts enrapt by the melody of his lyre. Such pictures, however, were only *symbolical*, and did not satisfy the religious craving for a *portrait*. The age of Constantine marks the transition from the symbolical to the *pseudo-historical* picture.

We now find C. represented in the midst of his disciples, or in the act of performing a miracle; but it is not till about the close of the 4th c. that we actually encounter that type of countenance which with certain modifications, continued to rule the conceptions of artists during the whole of the middle ages. To vindicate this type, myths, at a later period, sprang into existence; and we read of a portrait of C. possessed by King Abgarus of Edessa, and imprinted on a handkerchief, and of another miraculously obtained by St. Veronica at the Crucifixion; but there is as little foundation for these legends as for that which attributes to the evangelist Luke such a picture. The Emperor Alexander Severus (230 A.D.) is said to have possessed in his palace an image of Christ. An antique mosaic, probably of the 3d c., which exists in the *Museo Christiano* of the Vatican—where are to be found also some specimens of the frescoes of the catacombs—gives an idea of the manner in which the heathen artists expressed their notion of Christ. He is depicted as a bearded philosopher in profile. A letter which Lentulus, the predecessor of Pilate, is declared to have written to the Roman senate, but which is evidently apocryphal, attributes to C. a figure and countenance of manly beauty. Towards the middle of the 8th c., John of Damascus gives a description which he pretends to have gathered from more ancient authors. According to him, C. was tall, had beautiful eyes, but the eyebrows meeting; a regular nose, flowing locks, a black beard, and a sandy or straw-colored complexion, like his mother. Among the most ancient representations of C. which profess to be portraits, are the two paintings in the Calixtine and Pontine catacombs near Rome, and which are given in Arighi's *Roma Subterranea Nova*. The Saviour is there represented with an oval visage, a straight nose, arched eyebrows, and high forehead. The expression is earnest and mild; the hair is parted on the forehead, and falls over the shoulders in waving locks; the beard is short and scattered. These two busts agree with the apocryphal letter of Lentulus, and the artist or artists who executed them, may possible have employed it as a model. The majority of the Byzantine and Italian painters, down to the age of Michael Angelo and Raphael, adhered to this type.

CHRIST or CRIS CROSS ROW, the alphabet arranged in the form of a cross, for the use of children; and so printed, in old 'horn' books, or primers. The letter A was at the top, and Z at the foot of the cross.

CHRI'STCHURCH, a parliamentary and municipal borough and seaport on the English Channel, in Hampshire, at the head of the estuary formed by the Avon and Stour, 24 m. S. W. of Southampton. It has manufactures of fusee chains for clocks and watches, and of hosiery. It has also a salmon-fishery.

The priory church, one of the most interesting and magnificent of English ecclesiastical structures, dates from the reign of William Rufus, and was restored in 1861. The borough comprises two favorite watering-places, Mudeford and Bournemouth. There are traces here of a Roman temple of Mars. Pop. (1871) 15,415; (1881) 28,537. It returns one member to parliament.—C. Bay has a double tide every 12 hours.

CHRISTCHURCH, capital of the province of Canterbury, in New Zealand, situated on the river Avon, about 8 miles from the sea. Its port is Littleton, with which it is connected by a railway, and it is in railway communication with the north and south. It is the center of a great grazing district, and has also flourishing manufactories. There is a large export trade, chiefly in timber and wool. The city possesses numerous fine public buildings, churches, theater, &c. Pop. (1881) 15,214; with Sydenham and the suburbs 30,719.

CHRIST-CHURCH, THE CATHEDRAL OF, (Oxford). This great society has had three distinct foundations. In 1526, Cardinal Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he selected as the site of a new college, to be called Cardinal College, and which he intended to endow on a scale of magnificence beyond that of any other foundation in Oxford. On the fall of Wolsey in 1529, the whole establishment came into the hands of King Henry VIII. In 1532, that prince refounded it under the name of King Henry VIII.'s College, and in 1546, he once more re-established the college, under the name of 'Christ-Church Cathedral in Oxford, or the Foundation of King Henry VIII., with a dean and 8 canons, 60 students, 40 school-boys, clerks, choristers,' &c. This foundation is now subsisting, though it has undergone considerable modifications. To none of the canonries were any duties assigned by King Henry VIII. From time to time, however, the canonries have been annexed to various university professorships, more particularly one to the professorship of divinity, by King James I.; one to the professorship of Hebrew, by King Charles I.; and one to the professorships of ecclesiastical history and pastoral theology respectively, by Queen Victoria.

Several changes were introduced by the commissioners appointed under 17 and 18 Vict. c. 81. There is now only one sinecure-enjoying canon. When he is off the list, no one may hold a canonary save a professor, the archdeacon, or the sub-dean. The studentships are now 80 in number, and are, as before,

divided into junior and senior studentships, differing considerably as to emolument. All these are now open, the old system of appointment by nomination having been abolished. About three junior students are elected every year in Lent term, one in every three for excellence in mathematics or physical science; and besides these, three are sent up yearly from Westminster.

The senior studentships are also open, with the usual limitation of independent income. Of these, however, only a third can be held by laymen. The studentships were very poor; but an improvement in this respect had been included among the recent changes. Some valuable exhibitions, however, and 90 benefices, are in the gift of the society. In 1881, there were about 1200 names on the college books. No statutes were given to C., owing to the death of the king having taken place shortly after the final foundation of the college. It was, in consequence, entirely governed by the orders of the dean and chapter, to the total exclusion of the tutors. To this separation of the governing from the teaching body, as well as to the small value of the studentships, may be ascribed, in great measure, the inconsiderable degree of success in the schools, which, for many years past, brought no small discredit on this magnificent society.

CHRI'STENING, a term often used as equivalent to Baptism (q. v.). It is disliked by some, and of course liked by others, as favoring the doctrine of baptismal regeneration; being, indeed, according to its derivation, expressive of the notion that a person is *made a Christian* in baptism. But, like many other terms, it is frequently employed without reference to its origin, and without any intention of conveying the opinion which it might be strictly held to imply.

CHRI'STIAN II., king of Denmark, Norway, and Sweden, born at Vyborg, in the island of Funen, 2d July 1481. He ascended the throne of Denmark in 1513. Shortly after his marriage in 1515, with a sister of the Emperor Charles V., a young Norwegian peasant-girl, with whom C. was in love, died, or, as it was believed, was murdered. That natural ferocity, for which C. was surnamed the *Angry*, burst forth most furiously on this occasion. He caused the governor of the castle, Torben Oxe (see DYVEKE), to be beheaded. He afterwards declared open war against Sweden, took Stockholm through fraud, and had himself crowned king. But the cruel vengeance and treachery of C. after this event excited the indignation of that country, which, headed by Gustavus Wasa (q. v.), succeeded in driving out the Danes, liberating itself from the yoke of the House of Kalmar, and finally electing Gustavus Wasa (1523) to the throne. In Denmark, too, the aristocracy had risen, and an insurrection in Jütland following, C. found himself forced to flee for refuge to the Netherlands, and his uncle Fredrick I. (q. v.), the introducer of the Reformation into Denmark, elected king in his place. Encouraged, however, by the Catholic party in the Netherlands, and assisted by Charles V., C. landed successfully in Norway in 1531; but at the battle of Aggerhuus in 1532, he was totally defeated, and made prisoner in the castle at Sonderburg, from which he was liberated after twelve years of confinement. He died 28th January 1559.

CHRISTIAN IV., king of Denmark and Norway, and Duke of Schleswig-Holstein, born in Zealand, 12th April 1577, and elected successor to the throne in 1580. He assumed the scepter in 1593. From 1610 he carried on a successful war, known as the Kalmarian war, against Charles IX. of Sweden, and his successor, Gustavus Adolphus, which ended in an advantageous peace in 1613. As leader of the Protestants in the Thirty Years' War, C. was not successful. His labors for the improvement of his country, in which he was indefatigable, were, however, most beneficial. He strengthened its maritime power; extended its commerce as far as the East Indies, where he obtained the first possessions; and by restrictions upon the Hanse towns, greatly increased the inland trade of the country. His legislative and financial reforms, together with his love and patronage of the arts and sciencies, gained for him the esteem of his people, especially of the learned. He died in 1648.

CHRISTIAN VII., king of Denmark, son of Frederick V. and Louisa of England, born 29th January 1749. He succeeded to the throne of his father 14th January 1766, and in the same year married Caroline Matilda, sister of George III. of England. The dissipations of his early life had enfeebled his energies, and rendered him unfit for government. The management of the state was, in consequence, seized by his ministers, with Count Bernstorff, who had possessed the entire confidence of the king's father, at their head. Bernstorff, however, was soon forced to retreat before Struensee (q. v.), who exercised unbounded influence over the king and his imprudent young queen. But innovations of a despotic tendency, and insults offered to the national feeling, soon drew upon this minister the hatred of the nation. The queen-dowager, seeing this, made it an occasion for satisfying her ambitious nature, by attaching herself to the malcontents; and in 1772 she succeeded, with the assistance of her son, Frederick (b. 1754, d. 1805), in persuading the vacillating king to draw up an order of arrest for Struensee and the young queen. Bernstorff was recalled from Hamburg. The king, who was now incapacitated by mental disease, governed only nominally. In 1784, his son, Frederick VI. (q. v.), came to the head of the government, as joint regent with the queen-mother. C. died 13th March 1808.

CHRISTIAN BURIAL. See BURIAL and FELO DE SE.

CHRISTIAN CHARITY, KNIGHTS OF THE ORDER OF, in France. King Henry III. having instituted the order of the Holy Ghost for princes and persons of distinction, founded the order of C. C., for the support of maimed officers and soldiers, who had done good service in the wars. He assigned revenues to the order, drawn from all the hospitals in the kingdom.

The knights wore on the left breast an anchored cross embroidered on white taffety or satin, with a border of blue silk, and in the middle of the cross a lozenge of sky blue charged with a *fleur de lis or*. The completion of the institution was reserved for Henry IV., who placed it under the charge of the marshals and colonels of France; and by means of it, many of those who had served their country faithfully were enabled to spend the latter portion of their lives in peace, and above want. The order formed the germ of that noble hospital the *Invalides*, which was founded by Louis XIV., and which served as a model for our own hospitals of Chelsea and Greenwich. When the Invalides was founded, the order of C. C. was superseded.

CHRISTIAN CONNECTION, a denomination of Christians which originated about the beginning of the 19th c. in the United States of America, and is diffused over all the states. The name was assumed in avowed dislike to the acknowledgment of any human authority and to sectarian distinctions, and all doctrinal terms of communion were rejected, the Bible being adopted as the only rule of faith, and personal piety made the test of qualification for membership. The Connection soon came to consist, however, almost exclusively of persons denying the divinity of Christ.

CHRISTIAN KNOWLEDGE, SOCIETY FOR PROMOTING, one of the great religious associations connected with the Church of England, and the oldest of them all. It was founded in 1698, although it did not receive its present name till 1701; and had for its object: '1. To promote and encourage the erecting of charity schools in all parts of England and Wales. 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honor of God, and the good of mankind, by promoting Christian knowledge, both at home and in other parts of the world, by the best methods that should offer.' These objects it has never ceased to pursue, chiefly directing its efforts to the British dominions; partaking at once of the nature of an educational association, a Missionary Society, a Bible Society, and a Religious Tract Society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to about £100,000 a year. The profit on the bookselling department alone in 1880–81 was over £6000. The Protestant missionaries who labored in the south of India in last century, were supported chiefly by this society, which has also established many Christian schools.

CHRISTIAN NAME. See NAME.

CHRISTIA'NIA, capital of Norway, is situated in the province of Aggerhuus, in a beautiful open valley on the northern side of the Christiania Fiord. Pop. (1875) 77,041. C. is the seat of the Norwegian government, the superior courts, and the *Storthing*. Besides the suburbs of Pipervigen, Hammarsborg, Vaterland, and Groenland, the town consists of C. properly so called (which was laid out by Christian IV. in 1614, in the form of a regular parallelogram of 1000 paces in length and breadth); the Old Town or Opslo, where the bishop resides; and the citadel Aggerhuus, from which the broad straight streets of the town can be fired upon. The most important public buildings are the royal palace, the bank and exchange, the house of representatives or Storting, the governor's palace, and the cathedral. To these may be added the university, the only one in Norway, which was opened in 1813, and possesses a staff of 41 ordinary, and 6 extraordinary professors. About 800 students attend it annually. This institution contains, besides various scientific collections, a library of about 150,000 books, a botanical garden, and an observatory (in 59° 54′ 42″ N. lat., and 10° 50′ E. long.). The latter was opened in 1833. C. has also some good schools and learned societies, of which the 'Society for Northern Antiquities' is famous. The manufactures of C. are cotton, oil, paper, soap, and bricks. There are also numerous distilleries and corn-mills. It exports in considerable quantities wood, iron, anchovies, and glass-ware. Nearly 2000 vessels annually enter the port (which, however, is covered with ice for four months). It has a regular steam-boat communication with Gottenburg, Copenhagen, Keil, Hull, and Leith. C., by means of its bay, is connected with Drammen (pop. 18,838), famous for its extensive trade in timber, &c. The scenery of the whole bay is unsurpassed in beauty.

CHRISTIA'NITY. It is proposed in the present article to give a very brief outline of the system of the Christian religion, and of the evidences by which its truth is established. The principal parts, both of the system and evidences of C., will be found noticed under separate heads.

C. comes to us with a claim to be received as of divine origin. It is no product of the human mind, but has for its author the Being whom it sets before us as the object of worship. It is consequently altogether exclusive; it claims to be deemed the only true religion—'the truth'—and admits of no compromise or alliance with any other system.

C. cannot be viewed as distinct from the religion of the Jews and of the patriarchs; it is the same religion accommodated to new circumstances; there has been a change of *dispensation* only. In studying either the system or the evidences of C., we are compelled continually to revert from the New Testament to the Old, and must in some measure trace the history of the true or revealed religion through the previous and preparatory dispensations.

The whole system of C. may be regarded as having its foundation in the doctrine of the Existence of one God. See GOD. Next to this may be placed the doctrine of the Fall (q. v.) of Man. Man is represented as involved in misery by sin (q. v.)—*original* and *actual*—and every individual of the human race as incapacitated for the service and fellowship of God, obnoxious to the displeasure of God, and liable to punishment in the future and eternal state of being. See PUNISHMENT, FUTURE. And here we may regard the doctrine of the ATONEMENT (q. v.) as next claiming our attention—a doctrine taught in all the sacrifices (see SACRIFICE) of the patriarchal and Jewish dispensations, as well as by the words of inspired teachers. Man being utterly incapable of effecting his own deliverance from sin and misery, God sent his Son to save sinners, to deliver them from hell, to make them holy, and partakers of the eternal joy and glory of heaven.

By those who regard Christ as a mere creature, *atonement* or *reconciliation* with God is made to depend on the repentance of man as its immediate cause; whilst the life and death of Christ are represented as merely an example to us of obedience, virtue, and piety in the most trying circumstances; the doctrines of a propitiatory sacrifice, a substitutionary obedience, and an imputed righteousness, with all that form part of the same system, falling completely and even necessarily to the ground. These doctrines, however, are all consistently maintained in connection with the doctrine of the Trinity and the generally received doctrine as to the person of Christ. See CHRIST and TRINITY. The very incarnation (q. v.) of the Son of God is regarded as a glorious display of the divine condescension, and a wonderful exaltation of human nature: whilst a personal enjoyment of the highest dignity and bliss of which humanity is capable in favor and fellowship of God for ever, is to be attained by faith in Jesus Christ. See FAITH and JUSTIFICATION.

The indissoluble connection between faith and salvation arises from the divine appointment, but secures a moral harmony, as it provides for bringing into operation—in accordance with the intellectual and moral nature of man—of most powerful and excellent motives for all that is morally good, the partakers of salvation being thus fitted for the fellowship of Him into whose favor they are received; and as it prevents the possibility of any of them taking to themselves, or giving to others, the glory of that salvation which they really owe to Christ, and which they must therefore ascribe to Christ, as God is a God of truth, and truth must reign in the kingdom of heaven.

Salvation is ascribed by all Christians to the grace of God. The mission of Christ was an act of supreme grace; and all must be ascribed to grace for which we are indebted to Christ. The doctrine of grace, however, is a part of the system of C. on which important differences subsist, especially as to the relation of the grace of God to individual men.

Such are the differences concerning ELECTION (q. v.), and concerning the origin of faith, and man's ability or inability to believe of himself. But by Christians generally, the personal relation of the believer to Christ, and his faith in Christ, are ascribed to the Holy Ghost or Spirit of God, the third person of the Godhead, and so to the grace of God. See ARMINIUS, CALVINISM, and PELAGIUS.

In the view of all who hold the doctrine of the Trinity, the doctrines concerning the Spirit of God form a very important part of the Christian system. To the agency of this person of the Godhead, besides all that is ascribed to Him concerning the human nature of Christ, we are indebted for all that is spiritually good in man; He, in the economy of grace, being sent by God, on the intercession of Christ, to communicate the blessings purchased by Christ in his obedience and death. See HOLY GHOST.

Salvation begins on earth; and whenever a man believes in Christ, he is a partaker of it—is in a state of salvation. It forms an essential part of the Calvinistic system, that he who is in a state of salvation always remains so, and that the salvation begun on earth is in every case made perfect in heaven. See PERSEVERANCE OF SAINTS. Thus salvation is viewed as beginning in REGENERATION (q. v.), and as carried on in SANCTIFICATION (q. v.), and all its joys as connected with the progress of sanctification. Faith in Jesus Christ cannot be unaccompanied with repentance, and repentance is always renewed when the exercise of faith is renewed. For although all believers are *saints* or *holy*, as set apart to God, and in contrast to what they previously were, yet there is none in this life free from temptation and sin; the successful tempter of our first parents, who assailed our Saviour with temptation and was defeated, being still the active enemy of men, against whom believers in Jesus Christ are called to contend, to watch, and to pray. See DEVIL. The sense of responsibility belongs to human nature; and the doctrine of a Judgment (q. v.) to come may be considered as to a certain extent a doctrine of natural religion, as may also that of the Immortality (q. v.) of the Soul; but the clear and distinct enunciation of these doctrines belongs to the Christian revelation, to which belongs entirely the doctrine of the Resurrection (q. v.) of the Dead.

Of the moral part of C., which has already been referred to, it may be sufficient here to state, that it is as harmonious with the doctrinal as it is inseparable from it; that it is founded upon the attributes of God, and is perfectly illustrated in the character of Jesus Christ; and that it is divisible into two great parts—one, of the *love of God*, and the other, of the *love of man*, or of ourselves and our neighbors. See LAW, MORAL.

The *means of grace*, or of the attainment of the blessings of salvation, form an important part of the Christian system. Of these the WORD OF GOD—or divine revelation contained in the Bible (q. v.)—first claims attention, as the means of *conversion* to Christ, and of *edification* in Christ, the instrument by which salvation is both begun and carried on in men. The ordinances of God's worship are among the means of grace. Thus Prayer (q. v.) is one of the chief means of grace. The Sacraments (q. v.) are means of grace, concerning the precise use of which, and their relative importance as compared with the other means, considerable difference of opinion prevails among Christians. The same remark applies also to the combination of Christians into an organized body or community, the Church (q. v.), with its own laws or system of church-government (q. v.) and church-discipline (q. v.).

We have endeavored to sketch the outline of the system of C., as much as possible according to the general belief of Christians, merely indicating the points on which the chief differences of opinion exist. Some of the principal controversies will be found noticed under separate heads.

The truth of C. is established by many different *Evidences*, distinct and independent, but mutually corroborative. It appeals to reason, and demands to have its claims examined and admitted. Nor is there any *faith* where there is not a mental conviction arrived at by a process of sound reasoning.

The evidences of C. are very generally divided into two great classes, *internal* and *external*—the former consisting of those which are found in the nature of the Christian system itself, and in its adaptation to the nature and wants of man; the latter, of those which are derived from other sources. The boundary between the two classes, however, is by no means so distinct in reality as it appears in the definition of the terms. Of the multitude of books which have been written on the subject of the evidences of C., some are devoted mainly to one of these classes, and some to the other; whilst some are occupied with the development of particular evidences or arguments, and some with the refutation of objections, and in particular of what may be called a preliminary objection—that a divine revelation can never be established by sufficient evidence at all. See REVELATION.

The evidence of Miracles (q. v.) and the evidence of Prophecy (q. v.), two of the principal branches of the external evidences of C., will be found noticed in separate articles. Another argument, which has been much elaborated—for example, in Paley's *Evidences*—is derived from the character and sufferings of the apostles and other first preachers of C.; their high moral worth, considered along with their great earnestness and devotedness; the absence of all possibility of selfish or base motives; and at the same time, their perfect opportunity of knowing the truth of the facts which they proclaimed. A subsidiary argument is found in the admission of the great facts regarding Jesus of Nazareth, by the early opponents of Christianity.

A most important and valuable argument is found in the perfect coherence of all the parts of the Christian system, and in the agreement, as to the religion which they teach, of all the books of Scripture, notwithstanding the widely different dates of their composition, and their very different nature in other respects. See BIBLE. The relation of the Jewish ceremonies to the doctrines of C. supplies another argument of this kind, capable of being developed in a multitude of particulars. The minor coincidences between the different books of Scripture have been pointed out with happy effect in the *Horæ Paulinæ* of Paley, and in other works. The character of our Saviour supplies an argument of

great power: the impossibility of the invention of such a character, and of the history in which it is exhibited, by any effort of human genius, is also urged as corroborative; and the inconsistency of the morality displayed, with the supposition of imposture, has been dwelt upon with the same view. The excellency, both of the doctrinal and moral part of the system of C., its elevating and purifying tendency, the agreement of its doctrine with the fact of man's sinfulness and misery, and the suitable provision which it makes for his most deeply felt wants, are principal branches of the internal evidence of its truth. The effects of C., where it has prevailed, supply a confirmatory argument in its favor, which has formed the subject of works of great learning and interest.

CHRI'STIANSAND, the principal town of the province or *stift* of that name in Norway, is situated at the mouth of the Torridalself, in the bay of Christiansand. Pop. (1875) 12,137. C. is the residence of a bishop and high-bailiff or stift-amtmand, and possesses a branch of the Norwegian Bank, a gymnasium, and several charitable foundations. The manufactures are leather, tobacco, cotton, &c. Ship-building forms also a considerable branch of its industry. The town, which was built in 1641 by Christian IV., has an excellent harbor, divided into two parts by the island of Oddern. A destructive fire took plack here in 1880. C. exports wood, lobsters, and salmon in large quantities. The town and harbor are protected by several fortifications. To the west of C. lies the harbor of Ny-Hollesund.

CHRI'STIANSFELD, a settlement of Moravian brothers, in the northern part of Schleswig, was founded in 1772. It consists of 64 houses and about 700 inhabitants. The houses, which are well built, and cheerful in appearance, are arranged in two parallel streets, with the church upon a green plot in the middle. The settlement is represented by the inspectors or chiefs appointed by the directors of the fraternity, and the representatives elected by the members of the sect. The manufactures are linen, soap, cotton, leather, &c.

CHRI'STIANSTAD, the strongly fortified capital of a province of the same name in the south of Sweden. It is situated on the Helge, about 9 miles from the Baltic, and 265 south-west of Stockholm. C. is the residence of a governor, and the seat of a court of justice. It is a beautifully built town, and possesses an arsenal, a school, a magnificent church, and a senate-house. Pop. (1880) 9203, employed chiefly in the manufacture of woollen goods, leather, gloves, &c. There is also some trade in wood, pitch, potash, &c. The town, which was founded by Christian IV., has suffered many sieges. The province of Christianstad has an area of 2400 miles; pop. (1880) 230,619.

CHRI'STIANSTED, the chief town of the Danish island of St. Croix, in the West Indies. It stands on the north-east coast of the island, and has an excellent harbor, which is defended by a fort and a battery. Here resides the governor-general of the Danish West Indies. The number of its inhabitants is 5700.

CHRISTI'NA, queen of Sweden, only child of the great Gustavus Adolphus, was born December 1626, and succeeded her father in 1632, when only six years old. Distinguished equally by beauty and the possession of a lively imagination, a good memory, and uncommon intelligence, she received the education rather of a man than of a woman; and to this may in part be attributed the many eccentricities of her life. During her minority, the kingdom was governed by the five highest officers of the state, the principal being Chancellor Oxenstiern. In 1644, she assumed the reins of power, and, in 1650, was crowned with the title of *king*. She had previously declared her cousin, Charles Gustavus, her successor. For four years thereafter, she ruled the kingdom with vigor, and was remarkable for her patronage of learned and scientific men. In 1654, however, at the age of 28, weary of the personal restraint which royalty imposed on her, she abdicated in favor of her cousin, reserving to herself sufficient revenues, entire independence, and supreme authority over her suite and household. Leaving Sweden, she proceeded to Brussels, where she embraced the Roman Catholic religion. She afterwards went to Rome, which she entered on horseback, in the costume of an Amazon, with great pomp. Confirmed by Pope Alexander VII., she adopted the surname of Alessandra. In 1656, she visited Paris; and the following year, on a second residence there, she caused her grand equerry, Monaldeschi, who had enjoyed her entire confidence, to be executed in her own household for treason. In 1658 she returned to Rome, and, in 1660, the death of the king, her cousin, caused her to hasten to Sweden; but, failing in her attempt to be re-instated on the throne, she again left the country. In 1666, she aspired to the crown of Poland, but was unnoticed by the Poles. The remainder of her life was spent at Rome in artistic and scientific pursuits. Besides founding an academy, she collected valuable MSS., medals, and paintings, and died April 19, 1689. Much of her conduct favors the idea that at times she was scarcely sane.

CHRISTINA, queen of Spain. See MARIA CHRISTINA.

CHRI'STISON, SIR ROBERT, D.C.L., an eminent physician, son of Alexander Christison, Professor of Humanity in the university of Edinburgh, was born at Edinburgh, July 18, 1797; was educated at the High School of his native place, and, in 1811, became a student at the university there. After graduating in 1819, he proceeded to London and Paris; and, in the French capital, studied toxicology under the celebrated Orfila, a department of medical science in which in Britain his name has become eminent. Commencing the practice of medicine at Edinburgh, he was, in 1822, appointed Professor of Medical Jurisprudence in the university of that city, and, in 1832, was promoted to the chair of Materia Medica. Besides contributing papers on various subjects to medical journals, C. is author of a *Treatise on Poisons*, published in 1829, recognized as a standard work on the subject; *Biographical Sketch of Edward Turner, M.D.*, 1837; being an address delivered before the Harveian Society of Edinburgh; a treatise *On Granular Degeneration of the Kidneys*, 1839; and *The Dispensatory, a Commentary on the Pharmacopœias of Great Britain*, 1842. Twice President of the Royal College of Physicians, Edinburg, and Ordinary Physician to the Queen in Scotland, in 1871 he was created a baronet. In 1877 Sir Robert retired from professorial and other public work. He died Jan. 27, 1882.

CHRI'STMAS, the day on which the nativity of the Saviour is observed. The institution of this festival is attributed by the spurious Decretals to Telesphorus, who flourished in the reign of Antoninus Pius (138—161 A.D.), but the first certain traces of it are found about the time of the Emperor Commodus (180—192 A.D.). In the reign of Diocletian (284—305 A.D.), while that Ruler was keeping court at Nicomedia, he learned that a multitude of Christians were assembled in the city to celebrate the birthday of Jesus, and having ordered the church-doors to be closed, he set fire to the building, and all the worshipers perished in the flames. It does not appear, however, that there was any uniformity in the period of observing the nativity among the early churches; some held the festival in the month of May or April, others in January. It is, nevertheless, almost certain that the 25th of December *cannot* be the nativity of the Saviour, for it is then the height of the rainy season in Judea, and shepherds could hardly be watching their flocks by night in the plains.

C. not only became the parent of many later festivals, such as those of the Virgin, but especially from the 5th to the 8th c., gathered round it, as it were, several other festivals, partly old and partly new, so that what may be termed a *Christmas Cycle* sprang up, which surpassed all other groups of Christian holidays in the manifold richness of its festal usages, and furthered, more than any other, the completion of the orderly and systematic distribution of church festivals over the whole year. Not casually or arbitrarily was the festival of the Nativity celebrated on the 25th of December.

Among the causes that co-operated in fixing this period as the proper one, perhaps the most powerful was, that almost all the heathen nations regarded the winter-solstice as a most important point of the year, as the beginning of the renewed life and activity of the powers of nature, and of the gods, who were originally merely the symbolical personifications of these. In more northerly countries, this fact must have made itself peculiarly palpable —hence the Celts and Germans, from the oldest times, celebrated the season with the greatest festivities. At the winter-solstice, the Germans held their great Yule-feast (see YULE), in commemoration of the return of the fiery sun-wheel; and believed that, during the twelve nights reaching from the 25th December to the 6th of January, they could trace the personal movements and interferences on earth of their great deities, Odin, Berchta, &c. Many of the beliefs and usages of the old Germans, and also of the Romans, relating to this matter, passed over from heathenism to Christianity, and have partly survived to the present day. But the church also sought to combat and banish—and it was to a large extent successful—the deep-rooted heathen feeling, by adding—for the purification of the heathen customs and feasts which it retained—its grandly devised liturgy, besides dramatic representations of the birth of Christ and the first events of his life. Hence sprang the so-called 'Manger-songs,' and a multitude of C. carols, as well as C. dramas, which, at certain times and places, degenerated into farces or Fools' Feasts (q. v.). Hence also originated, at a later period, the Christ-trees, or C.-trees, adorned with lights and gifts, the custom of reciprocal presents, and of special C. meats and dishes, such as C. cakes, dumplings, &c. Of late it has become usual for friends to forward to one another, by post, gaily illuminated Christmas cards, bearing Christmas greetings.

In the Roman Catholic Church, three masses are performed at C.—one at midnight, one at daybreak, and one in the morning. The day is also celebrated by the Anglo-Catholic Church—special psalms are sung, a special preface is made in the Communion Service, and the Athanasian Creed is said or sung. The Lutheran Church, on the continent, likewise observes C.; but the Presbyterian churches in Scotland, and the whole of the English dissenters, reject it, in its religious aspect, as a 'human invention,' and

as 'savoring of papistical will-worship,' although, in England dissenters as well as churchmen keep it as a social holiday, on which there is a complete cessation from all business. But within the last hundred years, the festivities once appropriate to C. have much fallen off. These at one time lasted with more or less brilliancy till Candlemas, and with great spirit till Twelfth-day; but now a meeting in the evening, composed, when possible, of the various branches and members of a family, is all that distinguishes the day above others.

CHRISTMAS BOX, a small money-gift to persons in an inferior condition on the day after Christmas, which is hence popularly called *Boxing-day*. The term, and also the custom, are essentially English, though the making of presents at this season and at the new year is of great antiquity. A number of interesting particulars concerning the C. B. will be found in Brand's *Popular Antiquities*. Here, we need refer only to the usage in its later aspect. Within the memory of middle-aged persons, the practice of giving Christmas boxes, or petty presents, to apprentices, domestic servants, and tradesmen, had become a serious social nuisance, more particularly in London, where every old custom seems to linger, and is most difficult to be got rid of. Householders felt under an obligation to give money to the apprentices in the shops where they dealt, also to various inferior parish officers, including scavengers and lamplighters; while shopkeepers, on the other hand, were equally impelled to make presents to the male and female servants of their customers. Thus, as referred to in *Christmas*, a poem:

> 'Gladly, the boy, with Christmas Box in hand,
> Throughout the town his devious route pursues;
> And, of his master's customers, implores
> The yearly mite; often his cash he shakes;
> The which, perchance, of coppers few consist.
> Whose dulcet jingle fills his little soul
> With joy.'

At length the C. B. system became such an intolerable grievance, that tradesmen stuck up notices in their windows that no Christmas boxes would be given; and at the same time, the public authorities issued remonstrances to the same effect. At Christmas 1836, the Secretary of State for Foreign Affairs issued a circular to the different embassies, requesting a discontinuance of the customary gifts to the messengers of the Foreign department, and other government servants. Since this period, the practice has greatly decreased, doubtless to the improvement of the self-respect of the parties interested.

CHRISTMAS CAROLS. The word carol (Ital. *carola*, and Fr. *carole*, a round dance—probably from Lat. *corolla;* Welsh, *coroli*, to reel, to dance; the name is then applied to the music or song accompanying such a dance: *carillon* is probably allied) signifies a song of joy. The practice of singing carols, or, at all events, sacred music, in celebration of the nativity of Christ as early as the 2d c., is considered as proved by the circumstance that a large sarcophagus belonging to that period has sculptered upon it a representation of a Christian family joining in choral praise for this purpose. A century or two after this, however, the C. C. seem to have sadly degenerated, and become, in fact, so indecent, that the clergy found it necessary to forbid them.

Under the Anglo-Saxon kings, merriment and piety were pleasantly combined in English life, a peculiarity that affected the C. C. of that period not a little; but by the 13th c. the jocosity had unhappily lapsed into what would now be considered profanity. The oldest printed collection of English C. C. bears the date of 1521. The majority of these, though written by men of learning—priests and teachers—exhibit a lamentable ignorance of the character of the two most prominent persons in the carols—Mary and Jesus. In 1525 was kept the 'still Christmas,' on account of the illness of King Henry; but with this exception, the sacred season appears to have been regularly celebrated with joyous music and songs during the Tudor period. In 1562, C. C. of a more solemn nature were introduced. By the Puritan parliament, Christmas was abolished altogether, and holly and ivy were made seditious badges; and in 1630 the Psalms, arranged as carols, were advertised. After the Restoration, the C. C. again exhibited a hearty, cheerful, and even a jovial character. Those with which the dawn of Christmas is now announced in England are generally religious, though not universally so. In France, the carols, at this season used to be much less sacred than gay. Often, indeed, they were grossly Bacchanalian.

See an interesting paper in the *Athenæum* for December 20, 1856; also Sandy's *Christmas Carols*, 8vo., 1833; Sylvester's *Christmas Carols and Ballads*.

CHRISTMAS ROSE. See HELLEBORE.

CHRISTO'LOGY is the doctrine of the Person of Christ. The word itself is to be found, once or so, in the divines of the 17th c. (see Dean Trench on the *Study of Words*), but the department of scientific theology which it now represents is almost entirely the growth of modern, and particularly of German inquiry. As yet, it can hardly be said that the word C. is accredited in Great Britain, but the same differences of opinion which led to its adoption in Germany, are beginning to manifest themselves here also. There are only three methods of apprehending the doctrine of the Person of Christ. First, there is the *Rationalistic* method. This consists in representing the development of the Messianic idea in Jewish history as purely natural, and conditioned by purely human and historical influences—in short, as a subjective or self-originated notion, to which there was no correspondent Divine Reality. Second, there is, what, for want of a better word, we may call the *Spiritualistic* method (that of theologians like Neander, Rothe, &c.).

This consists in representing the development of the Messianic idea in Jewish history as both natural and supernatural; that is to say, it asserts the existence of a Divine Objective Reality ('the Eternal Son of God') as the basis of the subjective idea in the minds of the Jews, and regards the growth of that idea, and the influence of historical circumstances, as the result of a supernatural Providence, which culminated in the revelation 'of the mystery of godliness, God manifest in the flesh.' Third, there is the *Dogmatic* method, which is the one accepted by the common order of theologians. This consists in representing the doctrine of the Person of Christ as *symbolically* known to the spiritually-minded among God's people from the earliest ages. 'Abraham saw his (Christ's) day afar off.' This is interpreted to signify that, by the grace of prophetic illumination, the righteous men of old were enabled to foresee in a mysterious and inexplicable manner the atonement of Christ, as it happened in history. Admitting with the Spiritualistic theologians, that the Messianic idea among the Jews underwent, in some sense, a historical development, the dogmatic Christologists differ, in general, from the former by attributing to the higher minds such a knowledge of the *work* of Christ, as logically involves a knowledge of his person and character. The entire absence, however, of any *personal* traits of Christ in the Old Testament, such as might be expected of those who had seen him even with the eye of faith, has induced many orthodox theologians to shrink from making any statement in regard to what may have been the doctrine of the Person of Christ among the ancient Jews.

CHRISTOPHE, HENRI, king of Hayti, born October 6, 1767, was at one period a slave and tavern-cook in Cape Town, St. Domingo, and afterwards overseer of a plantation. In 1790, he joined the black insurgents against the French, and, from his gigantic stature, energy, and courage, soon became a leader among them. By Toussaint Louverture, he was appointed brigadier-general, and employed to suppress an insurrection headed by Moyse, or Moses, his nephew. C. captured the latter, and on his execution, succeeded him as governor of the northern province of French St. Domingo. In 1802, he gallantly defended Cape Town when General Leclerc arrived there with a French army destined for the reduction of the blacks, and effected his retreat with 3000 men, after having burned the greater part of the town. The perfidious seizure of Toussaint, he amply revenged, and during the short-lived government of Dessalines, who was slain by a military conspiracy in October 1806, C. was general-in-chief of the Haytian army. In February 1807, he was appointed President of Hayti for life.

A republic being, about the same time, organized at Port-au-Prince, with Petion at its head, civil war commenced between them. On March 28, 1811, C. was proclaimed *king* of Hayti, by the name of Henri I., and solemnly crowned, June 2, 1812. In 1814, he and Petion suspended hostilities, and by his power and skill, C. was enabled to counteract the attempts made by France to regain its authority in the island. His avarice and cruelty led to an insurrection, which was aided by General Boyer, who had succeeded Petion in 1818; and the rebellion having spread to Cape Town, C.'s deposition was proclaimed, at the head of the troops, by the Duke of Marmalade, one of the first dignitaries in the kingdom. Deserted by his body-guard and all his nobles, he shot himself, October 8, 1820. He left a code of laws, which he called the 'Code Henri,' in imitation of Code Napoleon.

CHRI'STOPHER, HERB. See ACTÆA.

CHRISTOPHER, ST., a saint of the Roman Catholic and Greek churches. He is supposed to have suffered martyrdom about the middle of the 3d century. According to vulgar legend, C., whose name was originally *Adokimos* (the Unrighteous), was a native of Palestine, Syria, or Lycia, and a person of prodigious bulk and strength. His height was 12 feet. So proud was he of his gigantic frame, that he would serve only the mightiest princes. Having attached himself to one, who went for the greatest of his day, C. stayed with him for a short time, but soon discovered that his master was terribly afraid of the devil, in consequence of which, C., with fearless consistency, passed into the service of the latter. One day, however, when the devil and he chanced to be walking through a wood, they came across an image of Christ. His new master exhibited such perturbation and alarm at the sight, that C. entirely lost confidence in him, and resolved to find out the Sav-

iour, and follow him. For a long time he searched in vain, but finally he fell in with a hermit, who showed him Christ and baptized him. C. despised the customary penances, and in consequence, it was imposed on him to carry Christian pilgrims on his shoulders over a stream which had no bridge. One day, a little child came to the stream; C. took it on his shoulders, but soon began to sink under the weight of his burden. The child was Christ himself, and to prove it, he commanded C. to stick his staff into the ground. He did so, and next morning it had blossomed into a palm-tree bearing fruit. This miracle converted thousands to Christanity. C.'s success excited the enmity of Dagnus, the prefect of that region, who put him in prison scourged him with red-hot rods, put a burning helmet on his head, and clapped him on a burning stool. C. still remained uninjured. Multitudes of poisoned arrows were now discharged against him, but they rebounded from his charmed body, and one even wounded the prefect himself in the eye. C. pitied his tormentor, a .d freely offered his head to the executioner, that the prefect might be healed by the blood which should flow from it. This was done, and, as a matter of course, Dagnus and his family became Christians. The Greek Church celebrates his festival on the 9th of May, the Roman Catholic, on the 25th of July.

St. C. was greatly invoked in times of pestilence, or when people were digging for treasures, to frighten away the spirits who watched over them. The formula used was called a *Christopher's Prayer*. He was also the patron of an Order of Moderation, founded in Austria in 1517, for the purpose of checking excessive drinking and swearing, and which was called the Order of St. Christopher.

CHRISTOPHER'S, St., or popularly, *St. Kitts*, an island near the north-east bend of the great arch of the Antilles, 46 miles to the west of Antigua, and 2 miles to the north of Nevis. With a very unequal breadth, it is 20 miles long from south-east to north-west, containing about 44,000 acres, and (1881) 29,137 inhabitants. It belongs to Great Britain, and has a legislature of its own, with an executive immediately subordinate to the governor-in-chief of the Leeward group, residing in Antigua. In 1880, the revenue of the colony was £32,000, having been only £3638 in 1834; so that, under the system of free labor, it had increased nearly nine-fold in 46 years. During the same interval, the imports had risen in value from £63,018 to £168,000, and the exports from £105,267 to £186,000. The staple exports are sugar, rum, and molasses. The debt of the island in the year 1880 amounted to £3700. Education is in a promising condition. In the year 1876 the average attendance at school was 1525; 2 schools obtained a first-class, 4 schools a second-class, and 14 schools a third-class certificate. The total class and capitation grants which were earned amounted to £577.

The chief towns, both of them seaports with open roadsteads, are Basse-Terre, defended by Fort Smith, and Sandy Point, protected by Fort Charles and Brimstone Hill. Of Fort Smith, the exact lat. and long. are 17° 17′ 7″ N., and 62° 48′ W. The mean annual temperature of these places, and of the coast generally, is about 80° F.; but the mornings and evenings, even of the hottest days, are agreeably cool. The length of the island is traversed by a well-wooded ridge of volcanic origin, which has in its center a crater; and towards the west extremity of the range, rises the nearly perpendicular crag of Mount Misery, with an altitude of 3711 feet above the level of the sea. Over the adjacent slopes, which gradually descend to the water's edge, this central range sends down several streams—almost every plantation, in fact, receiving its rivulet in the rainy season. The springs, though numerous are yet mostly brackish; and indeed the southern extremity of the island presents a number of salt ponds.

St. Kitts, appropriately named by the natives 'The Fertile Isle,' was discovered by Columbus in 1493, and colonized by the English in 1623, who were almost immediately joined by some French adventurers. After treacherously exterminating the Caribs, the French and English, often quarrelling, occupied the island, till, in 1713, the Treaty of Utrecht gave the whole to England. In 1782, during the war of American independence, St. Kitts was captured by the French, but restored. On July 31, 1865, a terrific fire took place at Basse-Terre.

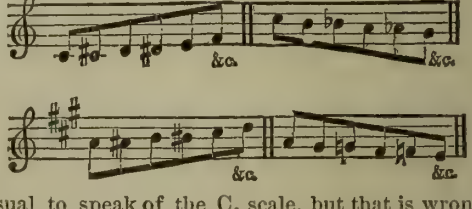
CHRIST'S COLLEGE, Cambridge, was originally founded by Henry VI., under the name of God's House, and was intended by him to consist of a master, 12 fellows, and 47 scholars. In 1505, however, there were only three fellows besides the master, when Lady Margaret, Countess of Richmond and Derby, mother of Henry VII., 'counting herself, as of the Lancaster line, heir to all Henry VI.'s godly intentions,' made up the full number, and endowed the college liberally, changing its name to Christ's College. Edward VI. added one fellow, and three scholars; and Sir John Finch and Sir Thomas Baines increased the number of fellows to fifteen. C. C. possesses many rich benefactions for the encouragement of students, amongst which are specially to be noticed four studentships founded by Christopher Tancred, worth £107 per annum, and tenable for three years after taking the degree of B.A. A student is elected annually before coming into residence. Amongst the illustrious men connected with this college may be noted Bishop Latimer, John Milton, and Ralph Cudworth, author of the *Intellectual System*.

CHRIST'S HOSPITAL, Newgate Street, London, was founded on the site of the Greyfriars' Monastery, by Edward VI., June 26, 1553, as a hospital for orphans and foundlings. It is usually called the 'Blue Coat School,' on account of the dress worn by the boys. This consists of a blue woollen gown or coat with a narrow red-leather girdle round the waist, yellow breeches, and yellow stockings, a clergyman's bands at the neck, and a small blue worsted cap, but this last they seldom wear, and are generally seen going about bareheaded—such has been the costume of the boys since the foundation of the school in the reign of Edward VI.; the persistency in it through successive generations, affording a curious instance of the unchangeableness in some of the English usages. No boy is admitted before seven years of age, or after ten, and none can remain after fifteen, with the exception of 'King's boys' (i. e., those who attend the mathematical school founded by Charles II. in 1672) and 'Grecians' (i. e., the highest class of scholars in the hospital), of whom 8 are sent on various scholarships to the universities of Oxford and Cambridge. Altogether, about 800 boys can be admitted. The right of presentation is vested in the managing governors. These are the lord mayor of London, the aldermen, and 12 common councilmen. Besides these, all noblemen and gentlemen who benefit the hospital to the extent of £400 are governors. The managing governors are the patrons of several churches, chiefly in Surrey and Essex. In 1880 (when changes in the institution were contemplated) the gross annual income was £70,907—mostly from legacies subsequent to the foundation. King Charles II. enriched it by £7000, with an additional annuity of £370, 10*s*. for the purpose of educating yearly ten boys for the sea-service. Most of the building perished in the Great Fire of 1666; but, through the generosity of the corporation of London and of wealthy Englishmen, it was soon rebuilt, under the superintendence of Sir Christopher Wren.

In the course of time, the new hospital fell into decay, and in 1825, a third structure was erected by Mr. Shaw. The great hall of the hospital is a magnificent room, second only to that of Westminster. C. H. is essentially a classical institution, Latin and Greek being the basis of education; but, to satisfy the wants arising from the changed condition of society, the modern languages, drawing, &c., are also taught. In 1683, the governors built a preparatory school at Hertford, where the children are trained till they are old enough to enter the hospital. The *girls*, however, remain permanently here. It can receive about 400 of both sexes. Dependent schools in Newgate Street accommodate 1200 children. Several eminent persons have been educated at C. H., such as Camden, Stillingfleet, Coleridge, and Lamb.

CHRIST'S THORN. See Jujube and Paliurus.

CHROMA'TIC, in Music, is a term applied to a series of notes at the distance of a semitone from each other. Such a series is produced by dividing the whole tones of the diatonic scale into semitones, so that with the two diatonic semitones, already in the natural scale, the octave is divided into twelve semitones. The word C. is from the Greek, and means colored. Ascending C. passages are formed by the whole tones of the diatonic scale being raised or elevated by a sharp or a natural, according to key, and descending passages by their being lowered by a flat or a natural, thus:



It is usual to speak of the C. scale, but that is wrong, as it is only a melodious progression of semitones, certain notes of which belong to, and form the diatonic scale, showing that the foundation of the system of music does not rest on a C. basis, but on the natural diatonic progression of sounds.

CHROMATIC, in Optics. See Achromatic.

CHROMA'TICS is that part of the science of Optics (q. v.) which explains the properties of the colors of light and of natural bodies. Before 1666, when Sir Isaac Newton began to investigate this subject, the notions which prevailed respecting the nature of colors were purely fanciful. Till Descartes' time, indeed, it seems not to have been conceived that color had anything to do with light. As examples of the notions prevalent at very early times, we may cite those propounded by Pythagoras and Zeno.

According to the former, color was the superficies of bodies; according to the latter, it was 'the first configuration of matter'—whatever that may be. It is now settled that white light is not homogeneous, but consists of rays of different colors, endued with different degrees of refrangibility, and that the different colors of bodies arise from their reflecting this or that kind of rays most copiously. According to this, a body that appears red reflects red rays in greater abundance than the others; and one that appears black reflects none of the rays—in other words, absorbs all the light that falls upon it. The analysis of a beam of the sun's light by a prism was the experiment by which Newton demonstrated his great optical discovery of the unequal refrangibility of the variously colored rays, and laid the foundations for the above theory of color. The reader will find an account of this experiment, and of the most interesting phenomena presented by the spectrum, under the article SPECTRUM. Newton concluded from his experiments that white light is composed of seven colors, which he called the primary colors—viz., red, orange, yellow, green, blue, indigo, and violet, and that all other shades of color arise from the admixture of these different proportions. Sir David Brewster, on the other hand, conceives that he has established that the primary colors are only three in number, red, yellow, and blue. This result he obtained by examining the rays of the spectrum through different absorbing media—a mode of experiment now admitted to be fallacious in principle. Professor Maxwell, by direct examination of the rays, concludes that the three primary colors are red, green, and blue. Recently, a theory has been propounded that all the colors are the results of the admixture of white light and of shade or darkness; but as yet no attempt has been made to support this theory by direct experiment on the sun's rays. It is rested on results obtained by combining by motion certain proportions of white and black pigments on a revolving card. See the articles LIGHT, DISPERSION, and NEWTON'S RINGS.

CHRO'MATYPE, (Gr. *chrome*, color; *typos*, impression), a photographic process, thus described by its discoverer, Mr. R. Hunt. One drachm of sulphate of copper is dissolved in one ounce of distilled water, to which is added half an ounce of a saturated solution of bichromate of potash; this solution is applied to the surface of the paper, and when dry it is fit for use, and may be kept for any length of time without spoiling. When exposed to sunshine, the first change is to a dull brown, and if checked in this stage of the process, we get a negative picture; but if the action of light is continued, the browning gives way, and a positive yellow picture on a white ground is obtained. In either case, if the paper, when removed from sunshine, is washed over with a solution of nitrate of silver, a very beautiful positive picture results.

In practice, it will be found advantageous to allow the bleaching action to go on to some extent; the picture resulting from this will be clearer and more defined than that obtained when the action is checked at the brown stage. To fix these pictures, it is necessary to remove the nitrate of silver, which is done by washing them in pure water. If the water contains any chlorides, the picture suffers, and long soaking in such water obliterates it—or if a few grains of common salt be added, the apparent destruction is rapid. The picture is, however, capable of restoration, all that is necessary being, to expose it to sunshine for a quarter of an hour, when it revives; but instead of being of a red color, it assumes a lilac tint, the shades of color depending upon the quantity of salt used to decompose the chromate of silver which forms the shadow parts of the picture. Mr. Bingham suggested the substitution of sulphate of nickel for sulphate of copper, as yielding a higher degree of sensitiveness and greater definition. Neither process has been much used.

CHRO'MIUM (*chrome*, color) is a metal, so called from the many colored compounds it produces. It was discovered by Vanquelin in 1797. C. occurs naturally as the chromate of lead (PbO,CrO_3), and the chromite of iron, *chrome iron ore* (FeO,Cr_2O_3), at Unst and Fetlar in the Shetlands, and Portsoy in Banffshire, &c. The metal has been obtained in powder and in scales, but as a metal it possesses no interest. The principal compound of C. is the bichromate of potash, obtained by heating chrome iron ore in powder with one-fourth of its weight of nitre, and then digesting in water, which dissolves out the chromate of potash (KO,CrO_3), a yellow salt, and when this is acted upon by sulphuric acid, it is converted into bichromate of potash ($KO,2CrO_3$), readily crystallizes in orange-red crystals, which is soluble in water, and is largely used by the dyer and calico-printer. If this salt be added to a solution of lead, an abundant yellow precipitate occurs of chromate of lead (PbO,CrO_3), or *chrome yellow*, which is used largely by the painter as a yellow pigment. A sesquioxide of C. (Cr_2O_3), *chrome green*, possessing a bright green color, which renders it useful in enamel-painting, and being innocuous, it is now introduced into paper-hangings instead of the highly dangerous arsenical green pigment. The bichromate of potash is employed in conjunction with sulphuric acid as an agent in bleaching palm-oil and other oils and fats.

CHRO'NICLE (from *chronos*, time), denotes a history in which events are treated in the order of time. A C. is understood to differ from annals in being more connected and full, the latter merely recording individual occurrences under the successive years or other dates. Most of our older histories were called chronicles, such as the *Saxon Chronicle*, *Holinshed's Chronicle*. The term is seldom applied to a modern book, but frequently to a newspaper—as, for instance, *The Morning Chronicle*.

CHRO'NOGRAM, or CHRO'NOGRAPH (Gr. *chronos*, time, and *gramma*, a letter or *grapho*, I write), a whimsical device of the later Romans, resuscitated during the *renaissance* period, by which a date is given by selecting certain letters amongst those which form an inscription, and printing them larger than the others. The principle will be understood from the following C., made from the name of George Villiers, first Duke of Buckingham:

GEORGIVS. DVX. BVCKINGAMIÆ.

The date MDCXVVVIII (1628) is that of the year in which the duke was murdered by Felton, at Portsmouth. See Hilton's *Chronograms* (1882).

CHRO'NOGRAPH. Different forms of time-measures, or time-recorders, under this designation, have been invented within a recent period. *Benson's* chronograph is intended to measure intervals of time down to tenths of a second, for use at horse-races and other occasions where a seconds watch is not exactly suited. It has an ordinary quick train lever movement, carrying hands which move over a dial. One of these is a seconds hand, very peculiarly made. This seconds hand is double, consisting of two distinct hands, one superposed on the other. The outer end of the lowermost hand has a small cup with a minute hole at the bottom; while the corresponding end of the uppermost hand is bent over so exactly as to reach this puncture. The little cup is filled with ink, having a consistency between that of writing fluid and printer's ink. Suppose that a horse-race is about to take place. The observer keeps a steady look-out for the fall of the starter's flag, or whatever the signal may be; he gives a pull to a cord or string connected with the mechanism peculiar to the instrument; by this movement, the outer and bent end of the upper seconds hand dips down through the ink-cup in the lower hand, and through the puncture to the dial. A small black spot or mark is thus made upon the dial-plate; and this is repeated as each horse passes the winning-post. A record may thus be obtained to about tenths of a second.

Strange's chronograph is designed for a more scientific purpose, and constructed with more careful details. The object is to measure extremely short intervals of time, for the determination of longitudes in great trigonometrical surveys. The observer, when a particular star traverses the field of his telescope, touches a small ivory key; and on the instant, a dot or mark appears on a sheet of paper coiled round a barrel. The instrument being connected with an astronomical clock, there is a dot made for every beat of the pendulum; and as these dots are a considerable space apart (considerable, that is, for the refined instruments of the present day), it is possible to determine so wonderfully minute an interval as one hundreth of a second.

In the very elaborate galvanic chronographs made by the Messrs. Dent for astronomical purposes, the lapse of every second in the minute, save the 60th, is pricked on a cylinder covered with paper; and the touching of a stud by an observer causes an observation-pricker also to puncture the cylinder. By measuring the relation of the latter mark to the preceding one, the time can be calculated to the $\frac{1}{100}$th of a second, and a record is kept for reference. (See description in *Nature*, vol. xxiii.)

Young's *recording* chronograph was designed to mark the instant of observation in hours, minutes, seconds, and hundredths of a second, in *printed* characters, and in a form suitable for preservation and reduction.

Chronographs connected with electric and magnetic apparatus are used for determining the velocity of projectiles. Many forms have been devised by Noble, Bashforth, Navez, Le Boulengé, and other inventors. The most general arrangement consists in causing the bullet to pass through a series of screens; the rupture of each screen breaks for a moment the continuity of an electric current, sets in action an electro-magnetic apparatus, and makes a permanent mark or record.

CHRONO'LOGY is the science of the divisions of time. It has two main branches—Mathematical C., and Historical Chronology. Mathematical C. is engaged with such of the units for the measurement of time as begin and end with the period of complete evolution of recurring celestial phenomena. See articles CALENDAR, YEAR, MONTH, DAY, and CYCLE, where the chief points in mathematical C. are explained. Historical C. uses these units among others to measure the distance in point of time between events, and to fix their *dates*. As in geography and navigation,

longitude is measured from some arbitrary line, such as the meridian through Greenwich, so in historical C., *dates* are fixed by giving their distance from some arbitrary point of time, usually chosen because of some remarkable occurrence which signalized it. Such a fixed point, or *epoch*, forms the beginning of an *Era*. It is thus that *dates* have been aptly said to be to events in history what the latitude and longitude of places are to the places in geography and navigation. The mathematical, or, to speak more properly, the astronomical units of time above referred to have not been, as has been already hinted, the only units used in historical chronology. In early times, the more accurate methods of mathematics were unknown, and such vague periods as 'a generation,' or the lifetime of leading persons in a nation, such as the priestesses of Juno, or of the kings, were assumed as units in historical chronology. The great variety of eras, too, in ancient times confuses the student of chronology. Thus the era of the Greeks began with the year of the first Olympiad, or that in which Corœbus was victor; being the first celebration of the games at which the victor's name was recorded, and which is calculated to correspond to the year 776 B.C. From this epoch, the Greeks measured time by Olympiads or periods of four years. Thus, the 3d year of the 12th Olympiad would be the year 729 B.C.

The Roman era was reckoned from the founding of the city, being either 752 or 753 B.C. The Roman practice of dating events from the building of the city, seems to be the first instance of the method of reckoning time from a fixed point by single years. It thus forms one of the great stages in chronology. Of other eras we shall merely mention the Mohammedan, which commences with the flight of Mohammed, 622 A.D., and which is called the *Hedjrah* (q. v.). The Roman and Greek methods of measuring time continued to be in use long after the birth of Christ; the Olympiads, indeed, appear to have been employed in Europe down to the 304th Olympiad, or 440 A.D. From 312 A.D., however, the public mode of computation throughout the Roman empire was by indictions, which were periods of 15 years, beginning with that year (see INDICTION); and this mode was at one time almost universally followed in the west. In France, it was not altogether discontinued till the end of the 15th century. The Christian era is said to have been first proposed in the year 527 A.D., and is now universally used in Christendom. Part of the business of C. is to determine the relationships of the different eras, so as to enable one to express, in the language appropriate to one mode of computation, the date of an event recorded in another. Owing to the birth of Christ being a comparatively recent event, the Christian era is attended by this inconvenience, that we must count backwards from it for the dates of occurences prior to it. To obviate this, various comprehensive periods, such as the Julian and Louisian Periods have been invented, which have the merit of being applicable to most events lying within the limits of history.

Various systems of C., such as the Chinese, Babylonian, Egyptian, Indian, and Chaldæan, are worthy of attention. Accounts of the periods which these nations respectively assign to their histories, will be found under the heads CHINESE EMPIRE, BABYLON, &c. Of *Sacred* C. there have been various systems. In these the epochs are the Creation of the World, and the Flood; but the chief copies of the Bible do not agree as to the dates of these events. While the Hebrew text reckons 4000 years from the creation to the birth of Christ, and to the flood 1656 years, the Samaritan makes the former much longer, though it counts from the creation to the flood only 1307 years. The Septuagint version differs from both. It removes the creation of the world to 6000 years before Christ, and 2250 years before the flood. These differences have never been reconciled. It is now, however, universally admitted, that the creation of the world is not to be regarded as having occurred even so recently as 6000 B.C. The modern understanding of the first chapter of Genesis leaves the period of the creation quite indefinite, and one scheme of interpretation stretches out the days of creation into periods of indefinite length. Of the *Newtonian* C., all that can be said here is, that it was an attempt, now generally admitted not to have been very successful, to rectify the obvious blunders of ancient chronologers, by determining certain epochs by means partly of astronomical calculations, and partly of the critical examination of such chronicles as measured time by reigns and generations. By a very fine argument, the soundness of which has since been doubted, Newton set down the date of the Argonautic expedition as being 43 years after the death of Solomon, or 937 B.C.

CHRONO'METER, or time-measures, is the name given principally to such time-keepers as are used for determining the longitude at sea. The mechanism is essentially the same as that of a common watch; only the size is generally greater, and additional precautions are taken to secure regularity under changes of temperature and other deranging influences. See WATCH, HOROLOGY.

CHRO'NOSCOPE, an instrument contrived by Sir Charles Wheatstone to measure the duration of certain short-lived luminous phenomena, such as the electric spark, of which the eye itself can be no judge, owing to the persistence of impressions of light on the eye after the cause of sensation has ceased. The phenomenon is observed by reflection in a mirror, in such rapid motion that the image of the luminous object would appear to describe a circle, supposing the luminosity to endure long enough. Should the phenomenon be instantaneous, the image will appear as a mere point; should it last for an appreciable time, the image will form an arc, greater or less, of the circle. The electric spark is found by this test to have no duration.

CHRU'DIM, a town of Bohemia, beautifully situated on a small river, about 62 miles south-east of Prague. It is walled, has a noble collegiate church, a high school and Capuchin convent, manufactures of cloth, and very important horse-markets. Pop. (1880) 11,886.

CHRY'SALIS, or CHRY'SALID, a name originally Greek, and strictly belonging to those *pupæ* of butterflies which are adorned with golden spots, but extended to the pupæ of lepidopterous insects generally, and even of other orders of insects. The chrysalids of lepidopterous insects are enclosed in a somewhat horny membranous case; sometimes very angular, sometimes nearly round; generally pointed at the abdominal end, sometimes at both ends; and before the caterpillar undergoes its transformation into this state, it often spins for itself a silken cocoon, with which earth and other foreign substances are sometimes mixed, so as to increase its size, and within which the chrysalid is concealed. Chrysalids are often suspended by cords, and generally remain nearly at rest; some have the power of burying themselves in the earth; others are bound by a single silken thread which passes round their middle (see cut); some twirl themselves round when touched, or when the stalk or leaf to which they are suspended is touched; and in general, they give signs of life, when disturbed, by violent contortions of the abdominal part. See INSECTS; PUPA; LEPIDOPTERA; BUTTERFLY, HAWK-MOTH, MOTH, and SILKWORM.

Chrysalids.
a, Orange-tip Butterfly; *b*, Black-veined White Butterfly; *c*, Swallow-tailed Butterfly; *d*, Purple Emperor; *e*, Silver-washed Fritillary; *f*, Duke of Burgundy Fritillary.

CHRYSA'NTHEMUM (Gr. gold-flower), a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*; having a hemispherical or nearly flat involucre, with imbricated scales, which are membranous at the margin, a naked receptacle, the florets of the disk tubular and hermaphrodite, those of the ray strap-shaped and female, the fruit destitute of pappus. The species of this genus are annuals, perennials, or shrubby; and all have leafy stems. They are natives chiefly of the temperate parts of the old world. *C. leucanthemum*, the OX-EYE, or OX-EYE DAISY, is abundant in fields, meadows, and grassy places of woods, in most parts of Europe. It has large flowers, with white ray and yellow disk. It is often a troublesome weed among hay and in pastures; being perennial, and having a creeping brittle root-stock, it is not easily extirpated. It is common in Britain, which has only one other native species, *C. segetum*, CORN MARIGOLD, a frequent weed in cornfields—although rare in the neighborhood of Edinburgh—an annual, with large deep yellow flowers. It is dealt with like annual weeds in general, by pulling it when young.—*C. carinatum*, an annual species with white ray and dark-red disk, the scales of the involucre keeled, a native of Barbary, is frequently cultivated in green-houses or—where the climate permits—in flower-gardens. The favorite species of the gardener is, however, *C. Indicum*, the CHINESE or INDIAN C., a native of China, Cochin-China, and Japan; which has long been cultivated in its native countries as

Chrysanthemum.

an ornamental plant, and of which there are many varieties. Its colors are also very various—red, lilac, rose-color, white, yellow, orange, or two colors combined. It flowers in autumn and winter. It is easy of cultivation, succeeds best in a light rich soil, is easily propagated by cuttings, suckers, or parting the roots, but requires the green-house in Britain. It was introduced in 1789. It is reckoned among florists' flowers.

CHRYSELEPHA'NTINE (Gr.; from *chrysos*, gold, and *elephas*, ivory), the art of making images of gold and ivory, was extensively practised amongst the Greeks. Winckelmann has calculated that about 100 statues of this kind are mentioned by the ancients. The colossal works executed by Phidias at Athens, in the time of Pericles, are the most famous of this class, the greatest being the Pallas of the Parthenon.

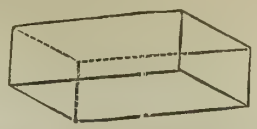
It was 26 cubits high, and represented the goddess in armor, covered with a long robe. The famous Olympian Jupiter of Phidias, executed in the same materials, was also a world-wide wonder. The combination of gold and ivory was chiefly used in temple statues; and though the execution of the more famous works of this class belongs to an advanced period of art, the use of various materials in the same statue was very ancient, and probably borrowed from the custom of adorning the wooden images of the earliest time with the precious metals. Sometimes, too, the head the arms and hands, and the feet were of marble, whilst the rest was of wood covered with thin plates of gold. These were called Acrolites (*akrolithoi*). See SCULPTURE.

CHRYSI'PPUS, an eminent Stoic philosopher, was born about 280 B.C., at Soli in Cilicia. He came to Athens when still a youth, and eagerly addicted himself to philosophical pursuits. His principal master was Cleanthes, although he is said to have also studied under the academic teachers, Arcesilaus and Lacydes, and learned from them what were the objections urged by sceptics against the doctrines of the Stoics. He had the reputation of being the keenest disputant of his age, and was happily described as 'the knife for the academic knots.' In fact, his logic was held to be so convincing, that the people were wont to say: 'If the gods make use of dialectic, it can only be that of Chrysippus.' It is also related of him, that he told Cleanthes he merely wanted to know the principles of his system, as he intended to find arguments for them himself; and this story appears to indicate his true position in philosophy. He was not the creator of a new system, but the expounder of an old. C.s' industry was very great. He seldom wrote less than 500 lines a day, and is said to have composed more than 700 works. Many of these, however, were compilations, and were not characterized by great beauty of style. Only a variety of fragments remain, which have been edited by Petersen (*Philosophiæ Chrysippeæ Fundamenta*, Altona and Hamburg, 1827).

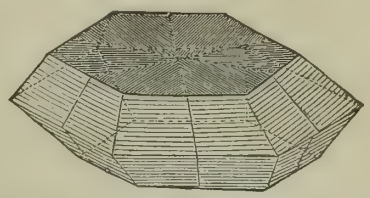
CHRY'SIS, a Linnæan genus of hymenopterous insects, now constituting a family *Chrysidæ*, allied to the *Ichneumonidæ*, and forming a connecting-link between them and the bees, wasps, &c. The French call them *Guêpes dorées* (gilded wasps), and they sometimes receive the English names of *Golden-tailed* and *Ruby-tailed Flies*. They delight in sunshine, and may be seen poised in the air—the motion of their wings being so rapid as to render the body alone of the insect visible.

CHRYSOBALANA'CEÆ, or CHRYSOBALANEÆ, according to some botanists, a distinct natural order of plants; according to others, a suborder of ROSACEÆ (q. v.). They are distinguished from the other plants usually included in the order Rosaceæ by their irregular petals, and by having the stamens also irregular, either in size or position; the ovary stalked, its stalk adhering on one side to the calyx, the style proceeding from its base. The fruit is a drupe of one or two cells. The species are trees or shrubs, natives generally of tropical and sub-tropical regions. About 50 species are known. The fruit of many is eatable, as the COCOA PLUMS (q. v.) of the West Indies (*Chrysobalanus*), the fruit of *Parinarium excelsum* in Sierra Leone, and that of *Moquilea grandiflora* in Brazil. The kernels of some resemble sweet-almonds, as those of *Parinarium campestre* and *P. montanum*. A useful oil is expressed from the seeds of *Prinsepia utilis*, a spiny plant, common in some parts of the Himalaya Mountains, and which is also planted for hedges in the Khasia Hills, at an elevation of 5725 feet above the sea; whilst in Sikkim, it is only found where the elevation is above 8000 feet. This plant would in all probability succeed well in Britain, and an attempt should certainly be made to introduce it.

CHRY'SOBERYL, a gem almost as hard as sapphire, and the finer specimens of which are very beautiful, particularly those which exhibit an opalescent play of light. Lapidaries sometimes call it oriental or opalescent chrysolite. It is of a green color, inclining to yellow, semi-transparent, or almost transparent, and has double refraction. It occurs crystallized in six-sided prisms; often in macles, or twin crystals. It is found in granite, in sandstone, and in alluvial soil; in Ceylon, Pegu, Siberia, Brazil, and



Right rhomboidal prism: primary form of Chrysoberyl.



A crystal composed of six twins, grouped together laterally, which in transmitted light appears red. From Siberia.

Connecticut. It is composed of alumina, glucina, and a little protoxide of iron; the alumina being about 80 per cent. of the whole.

CHRYSOCO'LLA, or COPPER-GREEN (Gr. gold-glue), an ore of copper, found in Cornwall and in many parts of the world, but particularly in Wisconsin and Missouri, where it is so abundant as to be worked for copper. As a pigment, it was much used by the ancients.

CHRY'SOLITE (Gr. golden-stone), a mineral composed of silica, magnesia, and protoxide of iron; of a fine green color, with vitreous lustre; transparent, and having double refraction; in hardness, about equal to quartz; and with conchoidal fracture. It often crystallizes in four-sided or six-sided prisms, variously modified. Very fine specimens are brought from Egypt and from some parts of the east, also from Brazil. C. is used by jewelers as an ornamental stone, but is not highly valued. *Olivine*, which occurs generally massive, in grains and roundish pieces, and is frequent in volcanic countries, and found in the igneous rocks of some parts of Scotland—as on Arthur's Seat—is regarded as a coarse variety of chrysolite.—The Chrysoberyl (q. v.) is sometimes called C. by jewelers.

CHRYSOLO'RAS, MANUEL, a learned Greek of Constantinople, was born in the middle of the 14th century. He is regarded as the first who transplanted Greek literature into Italy. About the year 1391, the Byzantine emperor, John Palæologus, sent C. to England and Italy to entreat assistance against the Turks. This mission made C. known in Italy, and, in 1397, he left his native land and went to Florence, where, as teacher of Greek literature, he was highly esteemed and admired. Leonardo Bruno, Poggius, Philelphus, Guarinus of Verona, and other eminent scholars were pupils of his. He was afterwards employed in public services—especially in mediating a union of the Greek with the Roman Church—by Pope Gregory XII. In 1413, C. went with John XXII. to the council of Constance, where he died 1415. Besides theological works, his *Erotemata*, or 'Accidence of the Greek Language' (Venice, 1484), has been preserved.—Manuel C. must be distinguished from his nephew, JOHN CHRYSOLORAS, who also went to Italy and gave lessons in Greek.

CHRYSOMELA and CHRYSOMELINÆ. See GOLDEN BEETLE.

CHRYSOPHYLLUM. See SAPOTACEÆ, MONESIA BARK, and STAR APPLE.

CHRY'SOPRASE is merely a variety of chalcedony, but is valued far above common chalcedony as an ornamental stone; so that a stone of this kind, fit for mounting in a ring, is worth from £10 to £20. It is of a fine apple-green color in choice specimens, but inferior ones exhibit other shades of green, and it is sometimes spotted with yellowish-brown. It is often set in a circlet of diamonds or pearls. Unfortunately, it is apt to lose its color through time, particularly if kept in a warm place; but dampness is favorable to its preservation, and it is therefore sometimes kept in damp cotton. It is found in Lower Silesia—where the search for it was particularly encouraged by Frederick the Great—and in Vermont. The inferior specimens are made into brooches, necklaces, &c.; and those still coarser, into snuff-boxes, seals, cups, &c.—The C. of the ancients was a stone of yellowish-green color, but it is not certain what it was.

CHRY'SOPS. See CLEG.

CHRY'SOSTOM, JOHN (Gr. *Chrysostomos*, golden-mouth; so named from the splendor of his eloquence), was born at Antioch in 347 A.D. His mother Anthusa was a pious woman, wholly devoted to her son, who grew up under her loving instructions into

an earnest, gentle, and serious youth, passing through, as Neander significantly observes, none of those wild, dark struggles with sinful passions which left an ineffaceable impress on the soul of Augustine, and gave a sombre coloring to his whole theology. He studied oratory under Libanius, a heathen rhetorician; soon excelled his teacher; and, after devoting some time to the study of philosophy, retired to a solitary place in Syria, and there read the Holy Scriptures. The ascetic severity of his life and studies brought on an illness which forced him to return to Antioch, where he was ordained deacon by Bishop Meletius in 381, and presbyter by Bishop Flavianus in 386. The eloquence, earnestness, and practical tone of his preaching excited the attention of Jews, heathens, and heretics, and secured for him the reputation of the chief orator of the Eastern Church. In 397, the eunuch Eutropius, minister of the Emperor Arcadius, who had been struck by the bold and brilliant preaching of C., elevated him to the episcopate of Constantinople. C. immediately began to restrict the episcopal expenditure in which his predecessors had indulged, and bestowed so large a portion of his revenues on hospitals and other charities, that he gained the surname of 'John the Almoner.' He also endeavored to reform the lives of the clergy, and sent missionaries into Scythia, Persia, Palestine, and other lands. His faithful discharge of his duties, especially in reproof of vices, excited the enmity of the patriarch Theophilus and of the Empress Eudoxia, who succeeded in deposing and banishing him from the capital. He was soon recalled, to be banished again soon afterwards. He now went to Nicæa, in Bithynia; but was from thence removed to the little town of Cucusus, in the desert parts of the Taurus Mountains. Even here his zeal was not abated. He labored for the conversion of the Persians and Goths in the neighborhood, and wrote the seventeen letters (or rather moral essays) to Olympias, to whom he also addressed a treatise on the proposition—'None can hurt the man who will not hurt himself.' The emperor, enraged by the general sympathy expressed towards C. by all true Christians, gave orders that he should be more remotely banished to a desolate tract on the Euxine, at the very verge of the Eastern Roman empire. Accordingly, the old man was made to travel on foot, and with his bare head exposed to a burning sun. This cruelty proved fatal. C. died on the way at Comanum, in Pontus, September 14, 407 A.D., blessing God with his dying lips. The news of his death excited much sorrow among all pious Christians, for C. was a man who drew the hearts of his fellows after him; a lovable, manly Christian, hating lies, worldliness, hypocrisy, and all manner of untruthfulness, with that honest warmth of temper which all vigorous people relish.

A sect sprang up after his death, or martyrdom as they conceived it, called *Johannists*, who refused to acknowledge his successors; nor did they return to the general communion till 438, when the Archbishop Proclus prevailed on the Emperor Theodosius II. to bring back the body of the saint to Constantinople, where it was solemnly interred, the emperor himself publicly imploring the pardon of Heaven for the crime of his parents, Arcadius and Eudoxia. The Greek Church celebrates the festival of C. on the 13th of November; the Roman, on the 27th of January. In his *Homilies* (Thomas Aquinas said he would not give in exchange those on St. Matthew for the whole city of Paris) C. displays superior power of exegesis. In general, he rejects the allegorical system of interpretation, and adheres to the grammatical, basing his doctrines and sentiments on a rational apprehension of the letter of Scripture. He is, however, far from being a bibliolater. He recognized the presence of a human element in the Bible as well as a divine; and instead of attempting, by forced and artificial hypotheses, to reconcile what he thought irreconcilable in Scripture statements, he frankly admitted the existence of contradictions, and shaped his theory of inspiration accordingly. But his greatest and noblest excellence lay in that power, springing from the fervor and holiness of his heart, by which the consciences of the proud, the worldly, and the profligate were awakened, and all were made to feel the reality of the gospel message. The surname C. was first applied sometime after his death, and, as it is supposed, by the sixth œcumenical council in 680. C.'s works are very numerous, and consist of, 1st, *Homilies*, on parts of Scripture and points of doctrine; 2d, *Commentaries*, on the whole Bible (part of which has perished); 3d, *Epistles*, addressed to various people; 4th, *Treatises*, on different subjects (such as Providence, the Priesthood, &c.); and 5th, *Liturgies*. Of these the most valuable, as well as the most studied, are the *Homilies*, which are held to be superior to everything of the kind in ancient Christian literature.

The most correct Greek edition of C.'s works is that by Henry Savil (8 vols., Eton, 1613); and the most complete Greek and Latin edition is that by Montfaucon (13 vols., Par. 1718—1738; republished in 1834—1840). The best authority in regard to C. is Neander, who, besides treating of his life and labors in his *Kirchengeschichte*, published a life of this eminent Father.

CHRYSOTYPE (Gr. *chrysos*, gold; *typos*, impression), a photographic process invented by Sir John Herschel, and depending for its success on the reduction of a persalt of iron to the state of protosalt by the action of light, and the subsequent precipitation of metallic gold upon this protosalt of iron. The process is conducted as follows: Good paper is immersed in a solution of ammoniocitrate of iron of such a strength as to dry into a good yellow color, without any tinge of brown in it. It is then exposed to light under a negative until a faint impression is obtained.

A neutral solution of chloride of gold is then brushed over the paper, when the picture immediately appears, and is rapidly developed to a purple tint. It should then be freely washed in several changes of water, fixed with a weak solution of iodide of potassium, again thoroughly washed, and dried. The action of the iodide of potassium is to convert any unaltered chloride of gold into a soluble double iodide of gold and potassium, thus rendering the picture permanent.

CHUB (*Leuciscus Cephalus*), a fish of the family *Cyprinidæ*, of the same genus with the roach, dace, bleak, minnow, &c. See LEUCISCUS. The color is bluish-black on the upper parts, passing into silvery white on the belly; the cheeks are gill-covers rich golden yellow. The C. rarely attains a weight exceeding 5 lbs. It is plentiful in many of the rivers of England, and occurs in

Chub.

some of those of the south-west of Scotland. In the rivers of Cumberland it bears the name of *Skelly*, supposed to have reference to the size of its scales; but the Schelly of Ullswater Lake is the Gwyniad, and the C. is there called the *Chevin*. It is found in many rivers of the continent of Europe; being the *Jentling* or *Bratfisch* of the Danube, and the *Jese* of the Oder. It spawns in April and May. It is not in great esteem for the table.

The C. rises well at a fly, and takes freely a variety of baits. The same baits and the same means of fishing may be employed as for the barbel and bream. The C. is very fond, moreover, of slugs, grasshoppers, cockchafers, and humble-bees. The latter two are to be used either naturally, by means of dibbing or dapping, or, being imitated, may be used artificially, and cast as a fly. The best flies for the C. are large red, black, and brown palmers, with the hackles laid on thickly. The best places to fly-fish for C. are close under over-hanging boughs at the sides of streams, or against piles, or other places where they can get some shelter, for the C. is somewhat shy and easily alarmed. He is a bold riser, and when he comes at a fly seldom fails to hook himself. Of all the baits for bottom-fishing, he prefers greaves, cheese, and worms; and the fatter the bait the better he likes it. He will occasionally run at a minnow, and is often taken on a spinning bait. The C. spawns in May, and comes into condition again by the end of June or early in July; bites best, and is in the best condition for bottom-fishing, in October and November. When first hooked, he makes a great dash, but he very soon gives in. Some years ago, the scales of the C. were in much request, in common with those of the bleak, for artificial pearl-makers.

CHUBB, THOMAS, an English rationalist, who wrote on religious questions during the first half of the last century, was born at East Harnham, in Wiltshire, in 1679. He received but a meagre education in youth, and after an apprenticeship to a leather glove and breeches maker in Salisbury, he became a tallow-chandler, in which business he continued to the end of his life. His first work, published in 1715, was entitled *Supremacy of God the Father Vindicated*. Besides this, he wrote a multitude of treatises on other religious subjects. Among these may be mentioned: *A Discourse on Reason, as a sufficient Guide in matters of Religion; On Sincerity; On Future Judgment and Eternal Punishment; Inquiry about Inspiration of the New Testament*; and *Doctrine of Vicarious Suffering and Intercession Refuted*. C. died in 1746.

CHUCUI'TO, or CHUQUITO, a town of Bolivia, in the dep. of Puno, and 100 miles east-north-east of Arequipa, on the west shore of Lake Titicaca, at the mouth of a stream flowing from the Andes. It was formerly of much greater size and importance than it is at present, having had, it is said, at the beginning of the 18th c., the incredible number of 300,000 inhabitants. Its present pop. is only about 5000. In the province of the same name, of which it is the capital, there are mines of silver and gold, and interesting antiquarian remains.

CHUCK-WILL'S-WIDOW (*Antrostomus Carolinensis*), a bird of the Goatsucker family (*Caprimulgidæ*), a native of the southern parts of the United States. It has received its singular name from its note, which resembles these words or syllables articulated with great distinctness, and is repeated like that of the cuckoo, or of its own congener, the Whip-poor-will (q. v.).

CHU-LAN. See CHLORANTHACEÆ.

CHUMBU'L, a river rising in the Vindhyan Mountains, which form the southern limit of the basin of the Ganges. Its source, at a height of 2019 feet above the sea, is in lat. 22° 26′ N., and long. 75° 45′ E. During a generally north-east course of 570 miles, it receives many tributaries on both sides, till, in lat. 26° 30′ N., and long. 79° 19′ E., it enters the Jumna from the right, with such a volume of water, that, when itself flooded, it has been known to raise the united stream 7 or 8 feet in twelve hours. The C. is remarkable, here and there, for the wildness of its current and the pictuesque character of its banks.

CHU'NAM, the Indian name for a very fine kind of quick-lime made from calcined shells or from very pure limestone, and used for chewing with Betel (q. v.) and for plaster. Both recent and fossil shells are used for making chunam. Extensive beds of fossil shells employed for this purpose occur in the south of India, particularly in low marshy situations near the sea-coast. The shells used are in the first place very carefully cleaned; they are then calcined in kilns, with wood charcoal. When chunam is be used for plaster, it is mixed with fine river-sand, and thoroughly beaten up with water. A little *jaggery* (coarse sugar) is also added. When very beautiful work is desired, three coats of chunam are given to the wall, and the result is a plaster almost equal to marble in its polish and beauty. The third coat is applied in the form of a very fine paste, consisting of four parts of lime and one of fine white sand, beaten up with whites of eggs, sour-milk, and *ghee* (butter). After it has been rubbed on with a wooden rubber, the surface is washed with a cream of pure lime, and is rubbed with a polished piece of quartz or rock crystal. During this process, the wall is sprinkled with powder of pot-stone, and the rubbing is continued until the wall is quite dry, every trace of moisture being finally removed by a cloth. Chunam is an important article of trade in India.

CHUNARGU'RH, or CHUNAR, a fortified town on the right bank of the Ganges, 16 miles to the south-west of Benares, and in the division of that name. It is in the district of Mirzapore, and lieut.-governorship of the North-west Provinces. The population of the town in 1871 amounted to 10,154. The fortress which occupies the summit of a sand-stone rock, contains the commandant's house, the hospital, the prison, and an ancient palace, with a deeply excavated well of indifferent water. The river in front is navigable at all seasons for vessels of from 50 to 60 tons.

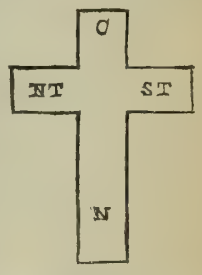
CHUQUISA'CA, or SU'CRE, the largest city of the state of Bolivia, in lat. 19° 20′ S., and long. 65° 30′ W. It is situated on a table-land about 9000 feet above the sea, and has a pleasant climate. The town is well built, has a cathedral of great magnificence, a university, a college of arts and sciences, and a mining-school. C. was founded in 1538 by Pedro Auzures, an officer of Pizarro's, on the site of an old Peruvian town called 'Choque Chaka,' or 'Bridge of Gold,' 'the treasures of the Incas having passed through it on their way to Cuzco.' At one time, C. bore the name of La-Plata, on account of the rich silver mines in its vicinity. Population, 12,000. C. gives name to a territory containing 220,000 whites, besides many native Indians. It has five silver mines in operation; and in it are magnificent ruins of unknown origin. The second name is derived from the general, who, in December 1824, fought and won the last great battle for colonial independence at Ayacucho.

CHUR (Fr. *Coire*, anct. *Curia Rhætorum*), a town of Switzerland, capital of the Grisons, in the valley of the Upper Rhine, in a fertile plain about 2000 feet above the sea, and surrounded by high mountains, 60 miles south-east of Zurich, on the Plessur, about a mile from its junction with the Rhine. It is of importance as standing on the great road to Italy by the Splügen and Bernardin passes, and thus possessing a considerable transit trade. C. stands on uneven ground, has narrow streets, and is divided into a high and low town. The bishop's palace, and the quarter around it, inhabited by the Roman Catholics, occupy the summit of an eminence, and are separated from the rest by walls and battlements, closed by double gates. In the same quarter stand the old cathedral, a round, arched or Byzantine edifice, founded in the 8th c.; the Church of St. Lucius or the *Dom*, a curious example of early-pointed Gothic, including fragments of earlier buildings. It contains singular old carving, paintings, and statues, and also it is said the bones of St. Lucius, who was a British king. Behind the episcopal palace is a kind of ravine lined with vineyards. In the lower town there are also some very ancient buildings. Romansch is still spoken in the vicinity; a newspaper in this dialect is published in the town; and a considerable collection of Romansch literature is to be found in the library of the cantonal schools. There are several new roads leading in different directions through the Grisons; and a railway connects the town with Zurich and other places. There are manufactures of zinc wares and cutting tools. Pop. (1880) 8889, of whom above 2000 are Catholics.

CHURCH, a word which signifies either a place of Christian worship, or a collective body of Christian people. It is, in all probability, derived from the Greek adjective *kyriakos* (from *kyrios*, lord), the place of worship having been called *the Lord's house*—and the worshipers *the Lord's people*. The Scottish *kirk*, the German *kirche*, &c., are merely different forms of it.

Under the terms APSE and BASILICA (q. v.), we have already explained that the earliest ecclesiastical structures of the Christians were copied or adapted not from the heathen or Jewish temple, as might have been anticipated, but from that peculiar combination of a hall of justice and a market-place to which the name basilica was given by the ancients. The reason of this selection is probably to be found, not so much in the spirit of opposition which no doubt existed between Christians and heathens, as in the essentially different conceptions which they formed of the character and objects of public worship. The rites of heathendom were performed exclusively by the priest, the people remaining without the temple; and the temple itself, which was lighted only from the door, or by the few lamps which burned around the image of the god, was regarded not as a receptacle for worshipers, but as the abode of the deity.

The dark mysterious character which thus belonged to it, rendered it equally unsuitable for the performance of liturgical services in which the people were to participate, and for the delivery of those public addresses which from the beginning were employed as a means of Christian teaching and exhortation. To such purposes the prætor's court-room, with its surroundings, were readily adapted, by the few simple alterations which we have described in the articles referred to. But the basilica, as thus altered, was a mere utilitarian structure. It served the purposes of Christian worship, but there was nothing in its form which responded to the feelings of Christian worshipers or tended to awaken Christian sentiments. Now, the Cross (q. v.) had been used by Christians from a very early period to indicate their allegiance to the author of their salvation and the object of their faith; and gradually it had become the distinctive emblem of Christianity. Nothing, then, could be more natural than that when it became desirable to give distinctively Christian characteristics to what hitherto had been a heathen structure, this should be effected by such a modification of its form as should convert it into a representation of this sacred emblem. Nor did this alteration lead to any very extensive change on the form of the C , as it had hitherto existed. The basilica, as we have already explained, not unfrequently had side entrances, either in place of, or in addition to, that from the end. All that was requisite, then, to convert the simple parallelogram of which it consisted into a cross, was, that at each side of the building these entrances, in place of direct communications with the exterior, should be converted into passages, or arms running out at right angles, and more or less prolonged, according as the object was to attain the form of a Greek or of a Latin cross (see CROSS). If the C. was to be in the form of a Greek cross, the arms were made of the same length with the other two portions into which they divided the building; whereas if the cross was to be a Latin one, the portion of the building which ran towards the west was made considerably longer than either of the others. In either case, the arms running at right angles to the C., and directly opposite to each other, cut it across, and thus obtained the name of *transepts*.



Church:
C = Choir; N.T. = North Transept; S.T. = South Transept; N. = Nave.

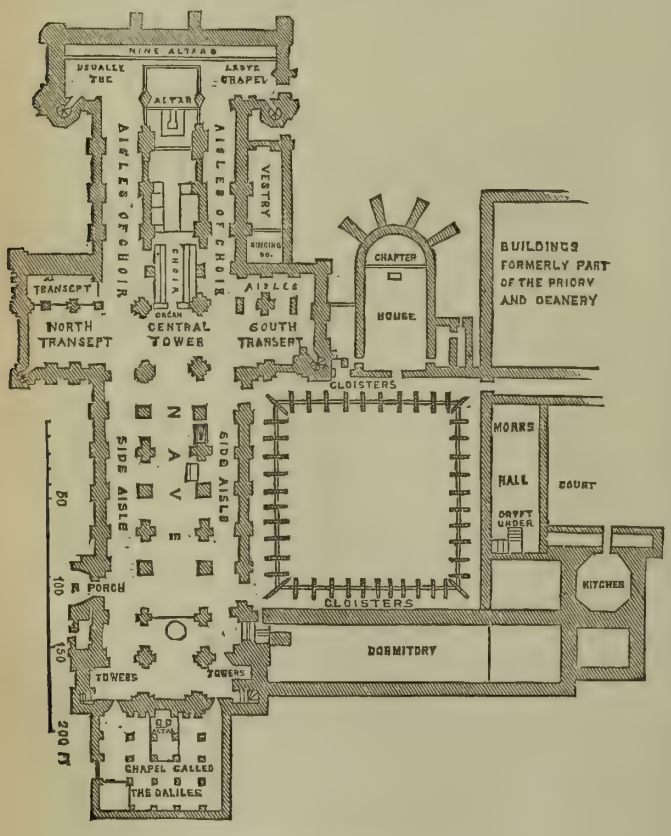
The external form of the C. being thus indicated, we now proceed to explain its internal arrangements, and to enumerate the various adjuncts which in cathedrals and others of the larger churches frequently sprang up around it.

Over the point at which the arms or transepts intersect the body of the cross, a central tower or spire is very frequently erected. From this central tower, or, if the tower or towers are situated elsewhere, from this central point, the portion of the building which runs westward, to where the Galilee or entrance chapel, or, in other instances, the great entrance-door is situated, is called the Nave (from *navis*, a ship), whilst the portion which runs eastward to where the altar, or high-altar, if there be several, is placed, is called the Choir.

In the larger and more complete churches, the nave, and frequently also the choir, are divided longitudinally by two rows of pillars into three portions, the portion at each side being generally somewhat narrower and less lofty than that in the center. These side portions are called the aisles of the nave, or of the choir, as the case may be. In some churches, the aisles are continued along the transepts, thus running round the whole C.; in others, there are double aisles to the nave, or to both nave and choir, or even to nave, choir, and transept. Behind, or to the east of the choir, is situated the Ladye's Chapel, or Chapel of the Virgin, with some-

times a number of altars; and it is not unusual for side chapels to be placed at different places along the aisles. These usually contain the tombs of the founder, and of other benefactors to, or dignitaries connected with, the church. The extent to which these adjuncts exist depends on the size and importance of the C., and they are scarcely ever alike in two churches, either in number, form, or position. Vestries for the use of the priests and choristers generally exist in connection with the choir. Along the sides of the choir are ranged richly ornamented seats or stalls, usually of carved oak, surmounted with tracery, arches, and pinnacles; and amongst these seats, in the case of a bishop's church, the highest and most conspicuous is the so-called *cathedra*, or seat of the bishop, from which the cathedral takes its name. The larger English cathedral and abbey-churches have usually a chapter-house attached to them, which is of various forms, most commonly octagonal, and is often one of the richest and most beautiful portions of the whole edifice. On the continent, chapter-houses are not so common, the Chapter (q. v.) being usually held in the cathedral itself, or in one of the chapels attached to it. Cloisters (q. v.) are also frequent, and not unusually the sides of those which are furthest removed from the C. or chapter-house, are enclosed by other buildings connected with the establishment, such as a library, and places of residence for some of the officials of the cathedral. It is here that, in Roman Catholic churches, the hall, dormitories, and kitchens for the monks are commonly placed. Beneath the C. there is frequently a Crypt (q. v.). In some cathedral churches, the crypt is in reality a second underground C. of great size and beauty. The Baptistery (q. v.) is another adjunct to the C., though frequently forming a building altogether detached. Most of the parts of the C. which we have mentioned may be traced on the annexed ground-plan of Durham Cathedral; see also plans of the cathedral of Salisbury and Amiens at GOTHIC ARCHITECTURE. The position of the nave, choir, or chancel, aisles, and transepts are nearly invariable, but the other portions vary, and are scarcely alike in two churches.

Churches are of five classes—metropolitan, cathedral, collegiate, conventual, and parish churches—and of these the first are, generally speaking, the most, and the last the least elaborate. In ordinary language, any building set apart for religious ordinances



Ground-plan of Durham Cathedral.

is called a church, though when of a minor kind it is more usually designated a chapel. After a long period of neglect and poverty of taste, the building of churches in a superior style, emulative of the older styles of architecture, has greatly revived, not only as regards the Church of England, but the Church of Scotland and nearly all dissenting bodies.

As applied to a collective body of Christian people, the word C. is the translation and equivalent of the Greek word *ecclesia* (Lat. *ecclesia*, Fr. *église*), used in the New Testament. It is common among Protestants to distinguish between the *visible* and the *invisible* C.—the invisible C. consisting of all those who are savingly or spiritually united to Christ, that is, of all true believers; the visible C. consisting of all who profess the religion of Jesus Christ. Roman Catholics do not in the same manner acknowledge the distinction between the visible and the invisible C., but regard a connection with the hierarchy, and consequent participation of ordinances, as establishing a connection with the true C. and with Christ. Protestants regard the C. as subsisting from age to age, in virtue of the authority of Christ, and through the faith of individual believers and their confession of him: Roman Catholics regard the apostolical succession of the hierarchy, and the regular administration of the sacraments, as essential to the continued existence of that *Catholic* or universal C. which Christ planted on the earth, and the existence of which he has promised to maintain throughout all ages. Protestants, in general, regard the C. of Rome and the Greek C. as forming part of the visible C. of Christ; but Roman Catholics are not accustomed to make a corresponding admission with respect to the Protestant churches. From the hierarchical principle of the C. of Rome, and of the Greek C., results an employment of the term C. to designate the hierarchy alone, which is contrary to the principles of the Reformation, although a tendency to it may be observed in some Protestant churches.

It has been usual for Protestants to designate by the term C. the collective body of Christians in a particular country, distinguished by the name of that country; the greater number of Protestants (Episcopalians and Presbyterians) believing that such a portion of the universal C. may warrantably be associated under a common government; and in countries where religious liberty exists, diversities of opinion on points of doctrine and C. government have given rise to the existence of separate Christian associations, distinguished by names generally indicative of some of the peculiarities which characterize them; but this, however much they may differ on many points, do not in general hesitate to recognize each other as belonging to the universal and visible C. of Christ, whilst they retain in common the same great first principles of the Christian faith, and particularly the belief in one God and in the three persons of the Godhead, the incarnation of the Son of God, the atonement by Jesus Christ, and the work of the Holy Spirit. The term C., however, is regarded by Independents (q. v.) or Congregationalists, as more strictly applicable to those who are united as worshipers in a particular place of worship, partaking of the Lord's Supper together, and exercising discipline and C. government among themselves.

CHURCH, STATES OF THE. See PAPAL STATES.

CHURCH-DISCIPLINE (*Disciplina ecclesiastica*) includes all the means employed by the Christian Church, besides the ministration of word and sacraments, to secure on the part of its office-bearers and members a faithful adherence to their profession and a corresponding blamelessness of life. It rests upon the authority of Christ, and at the same time necessarily arises, in some form of it, out of the very constitution of the church as a society. Among the early Christians, it soon assumed forms of great severity towards offenders, especially towards the *Lapsed* (q. v.). At a later period, the discipline of the church was chiefly exercised with respect to persons accused of heresy and schism. The penances of the Church of Rome have long formed an important part of its discipline, and therewith its *Indulgences* (q. v.) are closely connected, as well as its doctrine and rule of *Auricular Confession* (see CONFESSION). In the Protestant churches, public confession of sins by which public scandal has been given, and submission to public rebuke, are sometimes required. Practices more analogous to those of the primitive church were established in many churches after the Reformation, but in general have fallen greatly, or entirely, into disuse.

The power of exclusion from the Lord's Supper, and from the rights and privileges of church membership, is, however, generally retained and exercised, until, by profession of repentance, and by reformation of life, the cause of such exclusion is removed; and ministers or other office-bearers are, upon offence given in their doctrine or conduct, suspended from their functions, or altogether deposed from their office. The exercise of C. D. belongs more or less exclusively to a hierarchy, or to the office-bearers assembled in church-courts, or to the members of each congregation, according as the church is Episcopalian, Presbyterian, or Independent in its church-government. There is an an increasing tendency among Christians in general, to scrutinize closely the claim of right to exercise C. D., and the limits within which it may be exercised.

CHURCH GOVERNMENT. The Christian Church, like every other society, must have a certain constitution and rules according to which its affairs are administered. It is disputed, however,

among Christians, how far this constitution has been defined, or these rules prescribed by divine authority, and how far they have been left to the discretion of men. The form of C. G. depends primarily on the idea entertained of the constitution of the church. Congregationalists, or Independents (q. v.), accordingly place all C. G. in the hands of the members of the congregation and the office-bearers whom they have elected. This theory of C. G. is maintained by many Baptists and others, who, for various reasons, assume different denominations.—Episcopalians and Presbyterians agree that many congregations are to be united under a common government; but this, according to Presbyterians, is properly carried on by ministers and elders of these congregations meeting for this purpose on a footing of equality; whilst, according to Episcopalians, it is more or less absolutely in the hands of bishops, who are superior to the mere pastors of congregations. See EPISCOPACY and PRESBYTERIANISM.

CHURCH HISTORY, or ECCLESIASTICAL HISTORY. The history of the Christian religion and church forms one of the most important parts of the general history of mankind, and is intimately connected not only with the political history of the world, but with the history of philosophy, of literature, and of civilization. The sources and authorities are extremely various, and their due appreciation often requires as much judgment as their exploration requires toil. C. H. is either general—embracing a view of the affairs of the church in the whole world from the beginning to the present day—or particular, relating to some particular country, or time, or portion of the church. By some authors, it has been treated chiefly with regard to the outward affairs of the church; and by others, with reference to doctrine, morals, and the evidences of spiritual life; whilst others still have devoted their attention chiefly to the forms of worship, the constitution of the church, and other things generally comprehended under the name of Ecclesiastical Antiquities.

All these, of course, have important relations to each other. The earliest writers of C. H. were in general mere chroniclers, following the order of time; in the great work of the Magdeburg Centuriators, a method was adopted, of which there had been previous examples, and which afterwards became frequent, of treating each century separately, the centuries being subdivided according to convenience of subjects; but arrangements less mechanical and arbitrary have been adopted by the most eminent modern authors. With much diversity on minor points, there is a general agreement in dividing the whole history of the church into three great periods; the first, from our Saviour to the time of Constantine; the second, from that time to the Reformation; and the third, from the Reformation to the present day.

The earliest facts of C. H. are to be learned only from the New Testament, after which, however, the epistles and other writings of the apostolic and other primitive fathers, afford sources of information, unfortunately very scanty; Hegesippus, who wrote about the middle of the 2d c., has transmitted to us some very imperfect memorials of these early times; but the first proper ecclesiastical history is that of Eusebius of Cæsarea (324). This work was continued to the 5th c. by Socrates Scholasticus, Hermias Sozomenus, and Theodoret. Similar compilations were executed by Lactantius, Epiphanius, Hieronymus, Theodoret of Cyrus, Philostorgius, and Zosimus. In the 6th c., the chief ecclesiastical historians are—Theodorus Lector, Evagrius, and Nicephorus Callistius; in the 8th, the Venerable Bede and Paul Warnefried; in the 9th, Theophanes Confessor, Claudius of Turin, Haymo of Halberstadt, Scotus Erigena, and Hinkmar of Rheims; in the 12th and 13th, Photius, Simeon Metaphrastes, Theophylact, Matthew Paris, Albert of Strasburg, and Ptolemy of Lucca; in the 15th Laurentius Valla is the most conspicuous name. Protestant writers were the first to treat C. H. in a critical and scientific manner. This was natural, for their position as apparent schismatics compelled them to vindicate historically the changes which they had wrought in the character of the church. Hence their writings were of an apologetic and polemical cast. The first work of this kind was the *Magdeburg Centuries* (q. v.), published by Matthias Flacius. Special histories of the Reformation were composed by Sleidan and Seckendorf. In the 17th c., Calixtus distinguished himself in this department, and after him Thom. Illig, Adam Rechenberg, and Thomasius. The new life that awoke in Germany towards the middle of the 18th c., produced a multitude of church-historians, of whom we can only afford to mention Arnold, C. M. Pfaff, Mosheim, Semler, and J. Matt. Schröckh; while in still more recent times, Marheineke, Danz, Neander, Gieseler, and Hagenbach, have achieved the highest distinction in the same sphere of labor.

But others besides the Lutheran divines have rendered valuable services to church history. The Reformed Church boasts the eminent names of Du Moulin, Joh. Dallæus, Blondel, Hottinger, Spanheim, Turretin, Venema, Jablonski, and recently, D'Aubigné; while among Englishmen, Usher, Pearson, Bingham, Lardner, and recently, Milman and Maurice, have won a distinguished place. Scotland has few names, the chief being Calderwood, Woodrow, M'Crie, and recently Cunningham. In the Roman Catholic Church, since the period of the Reformation, ecclesiastical historians have rarely manifested a dispassionate and philosophic spirit. They have appeared mainly in the character of defenders of the papacy. The greatest names in C. H. in Catholic France are Tillemont, Bossuet, Bayle, Du Pin, Thomassin, and Fleury. Among the Italians may be mentioned Orsi, Saccharelli, Pallavicini, Guicciardini, and Muratori; and among the Roman Catholics of Germany, Dannenmayr, Count Stolberg, Ritter, Hortig, and Döllinger. The method of F. C. Baur (q. v.), developed by him specially with regard to the first three centuries of the Christian church, has deeply influenced all subsequent writing of church history. Recently the best works have been monographs and histories of limited periods.

CHURCH RATES, in England, a tax or assessment laid on the parishioners and occupiers of land within a parish, by a majority of their own body in vestry assembled, for the purpose of upholding and repairing the fabric of the church and the belfry, the bells, seats, and ornaments, the churchyard fence, and the expenses (other than those of maintaining the minister) incident to the celebration of divine service. The parishioners are convened for this purpose by the Church-wardens (q. v.). The Chancel (q. v.) being regarded as belonging peculiarly to the clergy, the expense of maintaining it is laid on the rector or vicar, though custom frequently lays this burden also on the parishioners, as in London and elsewhere.

The C. R. were anciently a charge on the tithes of the parish, which were divided into three portions: one for the structure of the church, one for the poor, and the third for the ministers of the church. This distribution is said to have originated with Pope Gregory, who enjoined St. Augustine thus to divide such voluntary offerings as might be made to his missionary church in England. A canon of Archbishop Ælfric in 970, and an act of the Wittenagemote in 1014, in Ethelred's time have been quoted in proof of the recognition of this rule by our Saxon fathers. It seems to have been their custom, also, to devote to the repair of each church a portion of the fines paid for offences committed within the district attached to it; and every bishop was bound to contribute to the repair of his own church from his own means.

A third of the tithes thus originally devoted to the repairs of churches, continued to be applied to that purpose under the Normans, down to the middle of the 13th c.; and the manner in which this burden came to be shifted to the parishioners, has been a subject of much discussion among legal antiquaries. Lord, then Sir John, Campbell, who published a pamphlet on the subject in 1837, is of opinion that the contributions of the parishioners were at first purely voluntary, and that the custom growing, it at last assumed the form of an obligation, and was enforced by ecclesiastical censures. The care of the fabric of the church, and the due administration of its offices, are laid upon the ministers and the church-wardens conjointly, and the latter may be proceeded against by citation, in the ecclesiastical courts, should they neglect these duties. But there is no legal mode of compelling the parishioners as a body to provide the rate; and this circumstance has occasioned much difficulty in imposing the tax in parishes in which dissent is prevalent, and led to many churches falling into a partially ruinous condition. The proper criterion foe the amount of C. R. is a valuation of the property within the parish, grounded on the rent that a tenant would be willing to pay for it. Glebe land, the possessions of the crown in the actual occupation of the sovereign, and places of public worship, are not liable for C. R.; but there is no other exception as regards immovable property, and in some parishes, custom even extends it to stock in trade. It has been often decided in the courts that a retrospective church-rate—i. e., a rate for expenses previously incurred—cannot be validly imposed. Much difficulty has been experienced in recovering the rates imposed by the parish on individuals refusing to pay. Previous to 53 Geo. III. c. 127, the only mode was by suit in the ecclesiastical court. That statute, however, in all cases under £10, empowered the justices of the peace of the county where the church was situated, on complaint of the church-wardens, to inquire into the merits of the case, and order payment. Against the decision of the justices, an appeal lies to the quarter-sessions. In 1868 an end was put to all parochial contentions by enacting that no suit or proceeding should thereafter be allowed in any court to enforce or compel payment of a church-rate, except where a local act authorized this rate. But except so far as related to the compulsory payment of these rates, the church-wardens might, as before, make, assess, receive, and deal with such rates. In each district parish, the inhabitants may treat their own church as if it were their parish church, and make and receive rates for the repair of the same. A body of trustees may now be appointed in each parish to receive contributions for ecclesiastical purposes in the parish. The result of this act of 31 and 32 V. c. 109, is thus not to abolish church-rates, but rather to convert them

into voluntary payments; allowing, as it does, all faithful adherents of the church to contribute, as before, to the repairs of their own churches. In Scotland the burden of upholding the parish churches is by custom imposed on the heritors of the parish; and where the parish is partly within burgh and partly in the country, the expense must be borne by heritors and proprietors of houses, in proportion to their real rent. See SCOTLAND, CHURCH OF; see also DISSENTERS, and PARISH.

Though very little is said on the subject in Scotland, the question is still on the same footing as it used to be in England; and an Episcopalian heritor would have as much reason for refusing to pay the customary parish burdens as the English Dissenter had for refusing to pay church rates. In Ireland, church rates were abolished in 1823.

CHURCH ROAD. See under the article HIGHWAY.

CHU'RCH-WARDENS, in England, are ecclesiastical officers, elected sometimes by the parishioners and ministers jointly, sometimes by the minister alone, and sometimes by the parishioners alone, for the purpose of protecting the edifice of the church, superintending the celebration of public worship, and to form and execute other parochial regulations. They are generally two in number. See CHURCH-RATES, PARISH, VESTRY.

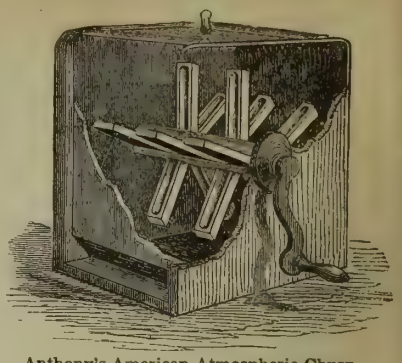
CHU'RCHILL, CHARLES, an English poet, now remembered almost as much for his profligacy as for his poetry, was born at Westminster, where his father was a curate, in 1731. He was educated at Westminster School, and in his 17th year made a clandestine marriage. In 1756 he was ordained, and two years afterwards, succeeded his father as curate of St. John's, Westminster. Soon after his transference here, he fell into habits very ill-becoming his clerical character. In 1761, he published (at his own risk, the booksellers having refused him five guineas for it) *The Rosciad*, a satire on theatrical managers and performers, which displayed much critical acumen, clever sarcasm, and no little humor, and enjoyed such an immense success, that C., who on its publication had withheld his name, was soon delighted to avow himself author. In the same year appeared *The Apology*, a bitter satire on some of his critics, which added alike to his purse and his notoriety. He now totally neglected the duties of his office, was a constant attender at theaters, and altogether led a most dissolute life. His parishioners were scandalized, and his dean remonstrated, whereupon C., to show his utter contempt for the ministerial profession, appeared in a blue coat, gold-laced hat and waist-coat, and large ruffles. He was obliged, however, to resign his preferment, which pecuniary sacrifice was little, as his works brought him considerable sums. He further displayed the complete licentiousness of his nature by separating from his wife, and seducing the daughter of a tradesman in Westminster, and by endeavoring to excuse his vices in a poem called *Night*, on the ground that avowed profligacy was more harmless than profligacy practiced in concealment. The boon-companion of as great a debauchee as himself—Wilkes—he contributed to the pages of the *North Briton*; among other things, *The Prophecy of Famine*, *A Scots Pastoral*, one of the best of his satires.

Among his other works, all more or less satirical, are the *Epistle to Hogarth*, *The Author*, *The Candidate*, *The Ghost*, *Gotham*, *The Duellist*, &c., of which *The Author* is the best. He died November 4, 1764, while on a visit to Wilkes at Boulogne. C.'s thorough reprobacy has naturally led to an unjust depreciation of his poetical abilities. See *Poetical Works*, by Took (1867), with *Life* by Hannay.

CHURCHING OF WOMEN, a religious usage prevailing in the Christian Church from an early period, of women, on their recovery after child-bearing, going to church to give thanks. It appears to have been borrowed from the Jewish law (Lev. xii. 6). In the church of the early ages, it was accompanied with various rites; and in the Church of Rome and Greek Church, it is imperative. In the Church of England, also, a service for the C. of W. finds a place in the Liturgy. By the Presbyterian and Independent church of Britain, it is rejected, as having no scripture warrant.

CHU'RCHYARD. See BURIAL, CEMETERY.

CHURN, a machine for agitating milk or cream for the production of butter. The principle of the operation is considered in the article on Butter. Of the great variety of forms that have been given to the machine, it is very difficult to determine which deserves the preference. It is obvious that the more thorough and uniform the agitation, the more completely will the butter be separated from the milk. The consistency and color of the butter are also elements in judging of the relative merits of churns. The temperature of the air and the milk affect the butter in these respects. During summer, that of the milk should not exceed 62°, and in very hot weather may be under 60°. During cold weather, the milk should be about 2° higher when put into the churn. The speed at which the operation is performed also influences the result. Trials instituted to test the relative merits of churns have failed to settle which is the best form for actual use in the dairy; for the same machine under different conditions does not always yield the same result. The oldest form is the upright or *plunge* churn. There is a general prejudice in favor of this form of C., on the ground that the butter is more completely separated and of better quality. Its great defect is that the operation, being generally performed by hand, is fatiguing.



Anthony's American Atmospheric Churn.

Recent improvements have chiefly aimed at ease in working, and a saving of time. The original *barrel* C., with a rotatory motion, like a grindstone, which motion was reversed every few rounds, has fallen from its once high repute into comparative neglect. An improvement on the barrel C. was the making of the barrel stationary, the milk being agitated by internal apparatus fixed on a horizontal spindle which is turned by a winch handle. Barrel churns, sometimes of monster size, are generally used in large dairies in Holland. For small or moderate-sized dairies, perhaps the most suitable is the *box* C., consisting of a cubical or oblong box, of birch or plane tree, having the agitators fixed on a horizontal spindle. Churns on a centrifugal action have also been successfully used, particularly in Sweden. More recently, churns of a barrel form, with an oscillating motion like a child's cradle, have been introduced, but without any decisively superior results.

To all forms of churns, power other than manual can be, and is applied. In some parts of the continent of Europe, and in America, the dog is employed in churning by means of a contrivance like a squirrel's box. Horse-power is in very general use in large dairies in Great Britain, and in some cases steam-power is used.

CHU'RRUS. See HEMP.

CHUSA'N, an island on the east coast of China, 40 miles northeast from Ningpo, in 30° 40′ N. lat., and 121° 48′ E. long, of an oblong shape, and about 50 miles in circumference. It is mountainous; but has many fertile valleys, with a plentiful supply of water, and is very carefully cultivated by the hardy and independent people by whom it is inhabited. Mr. Fortune was struck with the richness of its flora. Azaleas clothe the mountains; clematises, roses, and honey suckles grow in great luxuriance. The camphor and tallow tree, and many varieties of bamboo, are found in the valleys. Tea is cultivated to some extent on the hill-sides. For three-fourths of the year, the climate is temperate. June, July, and August are the hot months. In August, the thermometer averages 83°, but in January and February it is often as low as 20°. Ting-hai, the capital, a walled town about two miles in circumference, containing a fine specimen of Buddhist temple-architecture, surrendered to the British forces, July 5, 1840, and was retaken by them (having been evacuated the previous February) October 1, 1841. At the close of the war, the island was delivered up to the Chinese. In 1860, it was again occupied by British troops, but restored by the convention of Pekin. Pop. about 200,000.

CHUSAN ISLANDS, a group of islands scattered round the one described above. The most remarkable of these is the sacred island of Pu-tu, lying east from Chusan. It is covered with Buddhist temples, pagodas, and monasteries, which latter are inhabited by a great number of Bonzes, as the Chinese priests are called. The island is devoted exclusively to religious purposes, and no layman is allowed to reside upon it.

CHU'TNEE, or CHU'TNY, an East Indian condiment, very largely used in India and to a considerable and increasing extent in Great Britain. Indian C. is a compound of mangoes, chillies or capsicum (q. v.), and lime-juice, with some portion of other native fruits, such as tamarinds, &c., the flavor being heightened by garlic. It is sometimes manufactured for sale in England, but not in any quantity. Families occasionally make it for their own use, and employ the following ingredients: Chillies, 1—1½ lb.; apples 1 lb.; red tamarinds, 2 lbs.; sugar-candy, 1 lb.; fresh ginger root, 1½ lb.; garlic, ½—¾ lb.; sultana raisins, 1½ lb.; fine salt, 1 lb.; distilled vinegar, 5 bottles. The chillies are to be soaked for an hour in the vinegar, and the whole ground with a stone and muller to a paste.

CHYLE. The food undergoes various changes in the alimentary canal, which will be fully noticed in the article on DIGESTION. One of these changes is its conversion in the stomach into

a pulpy mass termed *chyme*. The chyme, which passes onward into the small intestine, is acted upon by the bile, pancreatic fluid, and intestinal juice, and through their influences is separated into the *chyle*, which is absorbed or sucked up by the lacteals (q. v.) and into matters unfit for nutrition, which ultimately find their way out of the system by the intestinal canal. The mode in which this nutritious C. is taken up by vessels distributed over the small intestines, and the changes which it undergoes before it is converted into true blood, are described in the articles LACTEALS, THORACIC DUCT, and NUTRITION. We shall here merely notice its leading physical and chemical properties. When obtained from the thoracic duct of an animal that has been killed while the process of digestion was going on (especially if it had taken fatty food), the C. is a white, milky-looking, or yellowish fluid, with a faintly alkaline reaction. Like the blood, it coagulates in about ten minutes after its abstraction from the body of the animal, and in about three hours a small but distinct gelatinous clot is separated from the serous fluid of the chyle.

On examining C. under the microscope, we find that it contains enormous numbers of minute molecules (probably consisting of fat), together with nucleated cells, which are termed the clyle-corpuscles, and are apparently identical with the white or colorless blood-cells. The chemical constituents of C. are much the same as those of blood; fibrin, albumen, fat extractive matters, and salts being the most important.

CHYLI'FEROUS SYSTEM. See LACTEALS and THORACIC DUCT.

CHYME. See CHYLE and DIGESTION.

CIALDINI, ENRICO, was born at Castel Vetro, Modena, August 10, 1813. Designed for the medical profession, he studed at Parma. When the abortive insurrection of 1831 broke out in the duchies, C. joined the volunteers of Reggio; and on the capitulation of Ancona, embarked for France, where he resumed his medical studies. The struggles against absolutism in the Iberian Peninsula opened anew the career of arms to the Italian exiles. He joined the legion raised by Dom Pedro in France against the Miguelists, when his great personal courage soon secured his promotion; and the unanimous vote of his comrades pronounced him the worthiest man to receive the Order of the Tower and Sword decreed by the government to his company. After the capitulation of Evora, C. joined (October 22, 1835) the legion of Oporto, formed under Borso di Carminati for service in Spain. In this force, C. gained further honors. In 1843, he followed Narvaez in his march against Madrid; was made by him colonel of the regiment of St. Ferdinand; and afterwards employed in organizing the Civil Guard on the model of the French *gendarmerie*. He was in this force when Charles Albert headed the Italian rising in 1848, when he hurried to Italy, and in the struggle which ensued he received a dangerous wound, and fell into the hands of the Austrians. On his release, he was employed by the Sardinian government to reduce to regular discipline the unruly volunteers from the duchies. He succeeded at last, and fought well at the head of his new regiment in the brief campaign of 1849. During the ten years that elapsed from the defeat of Novara to the renewal of the war in 1859, C. was actively employed. In the Crimea, he commanded the third division of the Sardinian Contingent; and on his return was appointed inspector-general of Bersaglieri and aide-de-camp to the king—a rare distinction for a man of plebeian origin. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi, placed under the command of Garibaldi after the declaration of war, and co-operated actively with them at the head of the fourth division. The victory at Palestro was his chief exploit, the further progress of the Italians being stopped by the peace of Villafranca. In 1860 he defeated the Papal army under General Lamoricière at Castelfidardo. Diplomacy delayed the fall of Gaeta till February 13, 1861, when it yielded to C. after a vigorous bombardment, as did the citadel of Messina shortly afterwards. Turin erected a statue to C. (*Vincitore Sempre*), and Reggio elected him deputy in April. For a few months he was governor of Naples. He had to act against Garibaldi in the second Sicilian expedition. When the army of Italy was reorganized in 1863, C. was appointed to one of the chief commands. Senator in March 1864, he signalized himself by his brilliant speech in favor of the transfer of the capital (Dec. 1864). In the war of 1866, the advice of La Marmora was followed, and the defeat of Custazza was the result. C. was appointed chief of the staff on the resignation of La Marmora. In 1867, C. was intrusted by the king with the formation of a new ministry, but failed; he was also made commander-in-chief of the troops in Central Italy. In 1870, he was engaged in the annexation of the Papal States; and in 1876, he was sent as ambassador to Paris.

CIBBER, COLLEY, was born on the 6th November 1671, in London. He was sent to the free school at Grantham, in Lincolnshire, in 1682. Five years thereafter, he returned to London, and in 1688 was a volunteer in the forces raised by the Earl of Devonshire in support of the Prince of Orange. He afterwards conceived a passion for the stage, and after performing gratuitously for several months, he succeeded in obtaining an engagement at 10*s*. per week, which was raised to 15*s*.; and on the commendation of Congreve, who had witnessed his performance of Lord Touchwood, five additional shillings per week were added. Incited by this magnificent success, he, at the age of 22, married Miss Shore, to the great rage of her father, who revenged himself by spending the greater portion of his fortune in the erection of a retreat on the banks of the Thames. After marriage, C., discovering that 20*s*. per week was a somewhat insufficient income for an elegant gentleman and an elegant gentleman's wife, was induced to add thereto by the writing of comedies, some of which were remarkably successful. In 1711, he became one of the patentees in the management of Drury Lane, and remained in conection with that theater till 1730; when, on being appointed poet-laureate, he sold his interest in the business. He was, however, sometimes tempted back to the stage by an offer of 50 guineas a night. C. wrote and adapted many plays, but as an author he is best known by his *Apology*. He died suddenly on the 12th December 1757.

CI'BOL. See ONION.

CIBRA'RIO, LUIGI, an Italian historian and politician, was born at Turin, 23d February 1802. He studied at the university of that city, where he took his degree in 1824, as Doctor of Laws. Devoted to historical investigations, he secured a reputation in this important department, at a very early period. In 1825 appeared *Notizie sulla Storia dei Principi di Savoia;* in 1826, his *Notizie di Paolo Simone de Belli;* and in 1827, his *Delle Storie di Chieri Libri IV*. King Charles Albert—with whom he was always a great favorite—frequently employed him in diplomatic service, and in 1848, when Italy rose against the Austrians, appointed C. extraordinary royal commissioner at Venice. During the same year, he was created a senator of the kingdom. When Charles Albert —after the unfortunate issue of the war—went to live in voluntary exile at Oporto, C. was sent by the Sardinian senate to induce him to return. He wrote an account of his unsuccessful mission, entitled *Ricordi d'una Missione in Portogallo al Re Carlo Alberto* (1850). During his public career, however, C. did not neglect his early and favorite pursuits. In 1839, he published his *Della Economia Politica del Medio Evo;* in 1840, his *Storia della Monarchia di Savoia;* in 1841, his *Storia e Descrizione della Badia d'Altacomba;* and in 1847, his *Storia di Torino*. But the new life and energy which Sardinia began to manifest under Victor Emmanuel had its claims on his public usefulness.

In 1850 he was appointed Superintendent-general of Customs, and while occupying this office introduced several important reforms. Subsequently, he was intrusted with full powers to negotiate a treaty of commerce with France, in which he distinguished himself notably by his advocacy of the principles of free trade. In 1852 he was made Minister of Public Instruction, and, in 1855, Minister of Foreign Affairs. When Cavour took this department into his own hands, C. became first secretary of the king. In 1857, he was appointed president of the Telegraphic Congress of Turin. In 1860, C. again made a most successful appearance as an author, in his *Operette Varie* (Torino), and in his *Jacopo Valperga di Masino, Cancelliere di Savoya*. He died at Salo, in the province of Brescia, 1st October 1870.

CICA'DA, a genus of insects of the order *Hemiptera*, sub-order *Homoptera*, remarkable for the sounds which they emit, the loudness of which is very extraordinary, when considered with reference to the size of the creatures producing them. The largest European species are only about an inch long. The elytræ, or wing-covers, of the cicadæ are almost always transparant and veined. They dwell on shrubs and trees, of which they suck the juices. The male insects alone possess the organs of sound perfectly developed. These are in noway connected with the mouth or throat, but may be described as a musical apparatus on the under side of the abdomen. This apparatus is very complicated, consisting of a set of membranes and fibres connected with powerful muscles. The sound can be produced even after the insect has been long dead, by pulling the fibres, and letting them escape. Cicadas are most common in tropical and warm temperate regions, and are scarcely known in Britain, although one or two species have been found in the south of England. The ancients regarded the sounds of these insects as types of music and eloquence. In some countries they bear names which signify that sleep is banished by their din. The sounds produced by some of the South American species, which are much larger than the European, are loud enough to be heard at the distance of a mile, and have been likened to the sound of a razor-grinder at work. The Greek name of the C. is *tettix*, often

Cicada.

erroneously translated grasshopper. These insects have indeed no resemblance to the grasshoppers, and no power of leaping. C. is the Latin name. The modern Italian is *cicale*, the French *cigale*. Byron speaks of the 'shrill cicalas.'

CICATRIZA'TION (Lat. *cicatrix*, a scar), the process of healing or skinning over of an ulcer or broken surface in the skin or in a mucous membrane, by which a fibrous material, of a dense resisting character, is substituted for the lost texture. The new tissue, in such a case is called the cicatrix, and usually resembles, to a consider able extent, the structure which it replaces; it is, however, less elastic, and from its shrinking in volume, sometimes produces an appearance of puckering. The glands and other special structures of the original tissue are wanting in the cicatrix, which, however, performs perfectly well, in most instances, the office of protection to the parts below the surface. See INFLAMMATION and ULCERATION.

CI'CELY (*Myrrhis*), a genus of umbelliferous plants, nearly allied to Chervil, of which one species, SWEET C. (*M. odorato*) is common in the central and southern parts of Europe, and in similar climates in Asia, but in Britain is so generally found near human habitations, that it appears probably to have been introduced. It is sometimes called *Sweet Chervil*, and in Scotland *Myrrh*. It is a branching perennial, two feet high or upwards, with large triply pinnate leaves and pinnatifid leaflets, somewhat downy beneath; the fruit, remarkable for its large size, and, as well as the whole plant, powerfully fragrant, the smell resembling that of anise. The seeds, roots, and young leaves are used in Germany and other countries in soups, &c. The plant was formerly much in use as a medicinal aromatic.

CI'CER. See CHICK PEA.

CI'CERO, MARCUS TULLIUS, tne greatest orator of Rome, and one of the most illustrious of her statesmen and men of letters, was born at Arpinum, on the 3d of January, in the year 106 B.C. He belonged to an ancient family, of the equestrian order, and possessed of considerable influence in his native district. His father, himself a man of culture, and desirous that his son should acquire an eminent position in the state, removed him at an early age to Rome, where, under the direction of the orator Crassus, he was instructed in the language and literature of Greece, and in all the other branches of a polite education. In his sixteenth year he assumed the manly gown, and was introduced to the public life of a Roman citizen. He now acquired a knowledge of law, and underwent a complete course of discipline in oratory. At the same time, he studied philosophy under three successive preceptors, of the Epicurean, Academic, and Stoic schools, and neglected no mental exercise, however arduous, which might conduce to his future eminence; being thus early of the opinion which he afterwards maintained in his treatise *De Oratore*, that an orator should possess almost universal knowledge. With the exception of a brief campaign under Sulla, in the Social War, he passed his time in these preliminary studies until his 26th year, when he began to plead in public. In one of his earliest causes, he distinguished himself by defending the rights of Roscius, a private citizen, against one of the favorites of Sulla, who was then dictator.

Soon after, for the benefit of his health, and in order to his improvement in elocution, he traveled to the chief seats of learning in Greece and Asia; and, on his return, was regarded as second to no orator at the Roman bar. Having been elected quæstor (76 B.C.), he was appointed by lot to a government in Sicily, a post which he filled with great ability, and to the entire satisfaction of those whom he governed. Some years after his return, he laid the Sicilians under still greater obligations by his successful prosecution of their prætor, Verres, against whom he prepared no less than six orations, although the first had the effect of disheartening the accused so effectually, that he voluntarily retired into exile. Passing, at short intervals, through the offices of ædile (69 B.C.) and prætor (66 B.C.), he was at length elected, by an overwhelming majority, to the consulship. His tenure of office was rendered memorable by the conspiracy of Catiline, which he frustrated with admirable skill and promptitude. See CATILINE. The highest praises were showered upon C.; he was hailed by Cato and Catulus as the 'Father of his Country;' and public thanksgivings in his name were voted to the gods. But his popularity did not last long after the expiry of his consulship. His enemies charged him with a public crime, in having put the conspiring nobles to death without a formal trial, and he found it necessary to leave Rome, and went to reside in Thessalonica (58 B.C.). A formal edict of banishment was pronounced against him, but he was recalled from exile in about 16 months, and on his return to Rome was received with great enthusiasm. His recovered dignity, however, soon excited the envy of the honorable party in the senate, with whom he had desired to make common cause; while Pompey and Cæsar, the greatest powers in the state, and from whose enmity he had most to dread, courted his alliance and co-operation. Thus, while preserving an appearance of independence, he was betrayed into many actions which he could not but regard as ignominious, and which, by increasing the power of the triumvirs, led indirectly to the ruin of the republic. A remarkable exception to this servile conduct is to be found in his assisting Milo when suing for the consulship, and defending him, against the wish of Pompey, and in spite of the hostile feeling of the populace, after he had slain Clodius in an accidental rencounter. During this period, he composed his works, *De Oratore*, *De Republica*, and *De Legibus*.

After a year's admirable administration of the province of Cilicia (51—50 B.C.), he returned to Italy on the eve of the civil war. With the convictions which he avowed, there was but one course which it would have been honorable for him to pursue—to enlist himself, at all hazards, on the side of Pompey and the republic. But instead of this he hesitated, balanced the claims of duty and of interest, blamed Pompey for his want of preparation, and criticised the plan of his campaign. At length he joined the army of the senate, but, after the battle of Pharsalia, abruptly quitted his friends, and resoloved to throw himself upon the generosity of the conqueror. After nine months' miserable suspense at Brundusium, he was kindly received by Cæsar, whom he followed to Rome. During the years which ensued, he remained in comparative retirement, composing his principal works in philosophy and rhetoric, including those entitled *Orator*, *Hortensius*, *De Finibus*, *Tusculanæ Disputationes*, *De Natura Deorum*, *De Senectute*, *De Amicitia*, and *De Officiis*. On the death of Cæsar, he was disposed to unite his interests with those of Brutus and the other conspirators, but was restrained by dictates of prudence. In the commotions which followed, he espoused the cause of Octavianus, and gave utterance to his celebrated philippics against Antony. These orations were the occasion of his death. When Octavianus and Lepidus joined with Antony in a triumvirate, C. was among the proscribed; and his life was relentlessly sought. The soldiers of Antony overtook him while his attendants were bearing him, now old, and in an infirm state of health, from his Formian villa to Caieta, where he intended to embark. He met his death with greater fortitude than he had supported many of the untoward incidents of his life. Desiring his attendants to forbear resistance, he stretched forward in the litter, and offered his neck to the sword of his executioners. He died in the 63d year of his age, on the 7th December, 43 B.C.

The character of C. is one which it is not difficult to estimate. Really a lover of virtue, no one could follow in her footsteps with greater dignity when attended by the popular applause. But he was weak enough to yield to the depraved spirit of his times, and to act according to his convictions only when they were not evidently discordant with his private interests. Few men, possessing such talents, have been so utterly devoid of anything approaching to heroism. As a statesman, it would be unjust to deny his legislative abilities; but he was generally deficient in courage and resolution. He was one of the greatest masters of rhetoric that have ever lived. His orations were the result of consummate art, combined with unwearied industry, and survive as characteristic memorials of a time when eloquence, far more than at present, was a power which bent the verdicts of judicial tribunals, and influenced the decrees of the state. In philosophy, he does not rank with the original thinkers of antiquity; nor, in truth, did he aspire to do so.

His writings on speculative subjects are valuable as reflecting the varied thought of the different schools. See his collected works by Orelli (9 vols. 1837; new ed. 1845); by Baiter and Kayser (1869). Also the lives by Middleton, Forsyth (1864), and Jeens (1880); and Trollope's *Life*, 2 vols. (1880).

CICERO'NÉ (from Cicero orator or speaker), a guide, usually for the purpose of showing the curiosities and works of art in a town to strangers. Ciceronés are of all degrees, from distinguished archæologists, who undertake the office as a favor, to the humble *laquais de place*, who, though quite indispensable on a first arrival, is too often both incompetent and dishonest. The stranger ought to be particularly on his guard against allowing a C. to make purchases for or even with him, as the practice of adding a commission to him to the price charged now prevails probably in every country in Europe.

CICHO'RIUM. See CHICORY and ENDIVE.

CICISBE'O is the name given in Italy to the professor gallant or constant attendant upon a married lady. In the higher ranks of Italian society, it was at one time considered unfashionable for the husband to associate with his wife anywhere except in his house. In society, or at public places of amusement, the wife was accompanied by her C., who attended at her toilet to receive her commands for the day. This custom, which was once universal, and which naturally gave rise to much scandal, has now almost disappeared. C. is sononymous with *cavaliere servente*.

CICINDELA, a genus of insects of the order *Coleoptera*, section *Pentamera*, the type of a large family, *Cicindelidæ*. This family is nearly allied to *Carabidæ*, and the insects belonging to it are among the most voracious of those beetles which both in their perfect and larva state, prey on other insects. They have a strong head, with projecting toothed mandibles, and are particularly distinguished by a sort of hook or nail, which is articulated by its base to each of the lower jaws or maxillæ. They are more abundant in tropical than in cold countries; a few species, none of them large, are found in Britain. The head of the larva is large, concave above, and the back furnished with two remarkable hooked spines, which are said to be used as anchors to fix it at any part it chooses of its burrow in the earth; whilst the soil which it excavates is carried to the mouth of the burrow in a sort of natural basket formed of the concave back of the head and the recurved mandibles. The larva lies in wait in its burrow, its head just level with the ground, till its prey comes within reach, upon which it suddenly rushes.—*C. campestris*, a green species with whitish spots, is common in most parts of Britain in dry sandy places exposed to the sun.

Cicindela campestris, larva and perfect insect.

CICO'NIA. See STORK.

CICU'TA. See HEMLOCK.

CID CAMPEADOR is the name given in histories, traditions, and songs to the most celebrated of Spain's national heroes. There is so much of the mythical in the history of this personage, that hypercritical writers, such as Masdea, have doubted his existence; but recent researches, more particularly those of Dozy, and the investigation of newly discovered Arabic sources, have succeeded in separating the historical from the romantic. See Dozy's *Récherches sur l' Histoire Politique et Littéraire de l' Espagne pendant le moyen âge* (Leyden, 1849). The following is the result of these inquiries: Roderigo Ruy Diaz (Roderic the son of Diego) was descended from one of the proudest families of Castile. His name first appears in a document written in 1064, during the reign of Ferdinand of Leon. Under Sancho II., son of Ferdinand, he became standard-bearer and commander of the royal troops. In a war between the two brothers, Sancho II. and Alfonso VI. of Leon, it was a stratagem of Roderic's—which according to modern notions, was anything but honorable—that secured the victory of Sancho at Llantada (1068) over his brother, who was forced to seek refuge with the Moorish king of Toledo. He appears at this time to have already been called the *Campeador*, a word supposed to answer to our champion.

Upon the assassination of his friend and patron, King Sancho, he required the next heir, Don Alonzo, to clear himself by oath of any participation in his brother's murder, ere the nobles of Leon and Castile should do homage to him. By this act, he incurred the new monarch's enmity; an enmity which, however, the king's policy concealed in the hour of danger, and he even consented to Roderic's marriage with his cousin Ximena—daughter of Diego, Duke of Asturia. But when the king thought the services of Roderic no longer necessary to his own safety, he lent a willing ear to the latter's personal enemies, and banished him in 1081. Roderic then joined the Moorish kings of Saragossa, in whose service he fought against both Moslems and Christians. It was probably during this exile that he was first called the Cid or Sîd, an Arabic title which means lord. He frequently defeated the king of Aragon and the Count of Barcelona, the latter of whom, Berenguer Ramon II., he took prisoner.

He was again reconciled to the king, but only for a short time, when he was condemned to a second exile. In order to support his family and numerous followers, he now saw himself forced to carry his sword against the Moors, over whom he gained a victory, and established himself as sovereign or lord of Valencia (1094). He retained possession of Valencia five years, during which time he took many neighboring fortresses. He died of grief in 1099, on learning that his relative and comrade in arms, Alvar Fañez, had been vanquished by the Moors, and that the army which he had sent to his assistance had been defeated near Alcira. After the Cid's death, his widow held Valencia till 1102, when she was obliged to capitulate to the Almoravides, and fly to Castile, where she died in 1104. Her remains were placed by those of her lord in the monastery of San Pedro de Cadeña. The Cid had a son, who was slain by the Moors in a battle near Consuegra. He also left behind him two daughters, one of whom was married to the Count of Barcelona; the other to an Infant of Navarre, through whom the kings of Spain and many royal houses of Europe claim kindred with '*Mio Cid el Campeador.*' Relics of the 'Blessed Cid,' as he is still called in Spain, such as his sword, shield, banner, and drinking-cup, are still held in great reverence by the populace. The numerous *Cid romances* that were first published in the 16th c., contain the most romantic improbabilities concerning the life and deeds of the Cid. See *Silva de Varios Romances* (1550), and *Romancero General* (1604). These romances were taken from the ancient *cantares* (national songs) and *poemas*, most of which are entirely lost. The most important of modern works on this subject, besides that of Dozy above mentioned, are Huber's *Geschichte des Cid*, &c. (Bremen, 1829), and Southey's fascinating *Chronicle of the Cid* (Lond. 1808). See also Willemaers, *Le Cid* (Bruss. 1873). The first adequate English translation is that of Mr. Ormsby, published in 1879.

CI'DARIS, a genus of *Echinidæ* (q. v.), or Sea-urchins, closely allied to the genus *Echinus* itself, and included along with it in a family or tribe called *Cidarites*, in which the mouth and anus are opposite to each other—the mouth below, and the anus above. Only one species, *C. papillata*, has been found in the British seas, and that only on the coasts of Zetland. The Zetlanders call it the *Piper*, from a resemblance which they trace in its globe and spines to a bagpipe. They say that it is sometimes found with spines a foot long. The markings of the shell and spines are extremely beautiful.

CI'DER is the fermented juice of apples, and is extensively prepared in Gloucestershire and other parts of England, in Ireland, in the northern districts of France, and in North America. In Normandy, a vast number of varieties of acid or bitter apples are grown for the preparation of cider. The apples are first bruised in circular stone-trough or *chase*, by a similarly shaped stone or *runner*, which revolves by machinery in the interior of the trough. The pulp so obtained is placed in sieve-bags made of haircloth or reed-straw, and subjected to pressure, which yields a dark-colored, sweet liquid, and leaves in the bag a somewhat dry residue, consisting of the pips, skin, and other fibrous parts of the apple. The apple-juice passes first into a shallow tub or *trin*, and is almost immediately placed in casks in a cool place, when fermentation begins, part of the sugar is converted into alcohol, and in a few days, a clear liquid is obtained, which can easily be racked off from sedimentary matter. C. is very largely used in England as a beverage, and is very palatable and refreshing. It contains from 5½ to 9 per cent. of alcohol, and is therefore intoxicating when drunk in quantity. It does not possess the tonic and nourishing properties, however, of bitter-beer. C. quickly turns sour, becoming *hard* C., owing to the development of lactic acid, and great difficulty is experienced in the attempt to preserve it.

CIEZA, a town of Spain, in the province of Murcia, 26 miles north-west of the city of that name. It is situated on an eminence near the river Segura, overlooking a plain of great fertility. The streets are tolerably wide and well paved; and there are manufactures of linen, hempen fabrics, wine and oil; and silkworms are reared. Pop. (1877) 10,910.

CIGA'RS. See TOBACCO.

CI'GOLI, LUDOVICO CARDI DA, an eminent painter of the later Florentine school, which, about the end of the 16th c., developed, in opposition to the languid mannerists of the time, a peculiar *eclectic* style of art. C. was born at Empoli in 1559. His model was Correggio; but as the latter was deficient in design, and in a scientific knowledge of perspective, C. endeavored to unite these with the warm bright coloring and wonderful chiaroscuro of Correggio. He was invited by Clement VII. to Rome, where he died in 1613. Among C.'s most famous pictures may be mentioned—'The Healing of the Lame Man' (St. Peter's, Rome), 'The Martyrdom of St. Stephen' (Uffizi Gallery, Florence), 'Tobias in the Act of Thanking the Angel' (St. Petersburg), and 'St. Francis,' a favorite subject with Cigoli (Pitti Palace, Florence). C. was also held in high estimation as an architect, and designed several of the Florentine palaces.

CI'LIA (Lat. eyelashes), a term variously employed in botany and zoology to designate fringing hairs or hair-like processes. Thus, the margins or nerves of leaves, petals, &c., are often described as *ciliated* or furnished with cilia. The fine thread-like processes which surround the opening of the fruit of many mosses, are called C.; but these processes, when broader, are denominated teeth.—The description and uses of C. in the animal kingdom are given in the article EPITHELIUM.

CILI'CIA, an ancient division of Asia Minor, now included in the Turkish eyalet of Koniah. The Taurus range, which separated it from Cappadocia, bounded it on the N., the Gulf of Issus and the Cilician Sea on the S., while the Amanus and Pamphylia bounded it respectively on the E. and W. Lat. 36°—38° N., long. 32° 10′—37° 8′ E. The eastern portion of C. was fertile in grain, wine, &c; while the western and more mountainous portion furnished inexhaustible supplies of timber to the ancients. The pass called by the Turks Gölek Bógház is that by which the younger Cyrus passed from Tyana in Cappadocia to Tarsus; and it is also the same by which Alexander the Great entered Cilicia. Pop. about 100,000, mostly nomadic.

In early ages, C. was ruled by its own kings, the dynasty of Syennesis being apparently the most important. The Cilicians were a distinct people in the time of Xenophon; but the Greeks appear to have got a footing after the time of Alexander. The Cilicians were notorious pirates, but having carried on their depredations too close to the shores of Italy, the Roman arms were turned against them, and C. was made a Roman province in Pompey's time.

CIMABU'É, GIOVANNI, one of the restorers of the art of painting in Italy, which had fallen into neglect during the barbarism of the dark ages, was born at Florence in 1240. At this time, the fine arts were practised in Italy chiefly by Byzantines, and had degenerated into a worn-out mechanical conventionalism. C. at first studied under Byzantine masters, and adopted their traditional forms, but gradually excelled his teachers, made innovations on the fixed patterns set before him, and gave life and individuality to his works. Two remarkable pictures of the Madonna by C. are still preserved in Florence—one (chiefly Byzantine in style) in the Academy; the other, displaying a more purely original genius, in the church of Santa Maria Novella. It is said that this latter work in the time of C. was admired as a miracle of art, and was carried to the church in a sort of triumphal procession. More remarkable pictures, in point of expression or dramatic effect, are found in C.'s frescoes in the church of San Francisco at Assisi. C. died soon after 1300. What strikes one as very wonderful about C.'s pictures, is the accuracy of his naked figures, considering that he had no better professional guides than the Byzantine artists. His draperies were also very good, but he had apparently no knowledge of perspective, though acquainted with architecture. His greatest pupil was Giotto (q. v.).

CIMARO'SA, DOMENICO, an Italian composer of operas, was born at Naples in 1755, and was educated in music under Sacchini, and in the conservatory of Loretto. His first pieces were the *Sacrificio di Abramo* and the *Olympiade*. When barely 22, he had achieved a reputation in all the leading Italian theaters. He was then called to St. Petersburg, where he resided four years. Afterwards, he lived at various German courts; thence he proceeded to Vienna, where he became imperial chapel-master; and finally, he returned to Italy. At Naples, his comic opera, *Il Matrimonio Segreto*, composed at Vienna, 1791, was repeated 57 times in succession. C. died at Venice in 1801. His comic operas are remarkable for their novelty, spirit, whimsicality, and liveliness of idea, as well as for their great knowledge of stage-effect. The wealth and freshness of his invention gave rise to the saying, that one finale of C. contained material for a dozen operas.

CI'MBALO, a musical instrument with a set of keys like the clavecin or harpsichord.

CI'MBRI, or KI'MBRI, a people who issued from the north of Germany in conjunction with the Teutones, and first came into hostile contact with the Romans in the Eastern Alps in 113 B.C. They were victorious in several great engagements, and were only prevented from devastating Italy by sustaining a terrible defeat from Marius, on the Raudii Campi, near Verona, or, according to others, near Vercelli, in August, 101 B.C. Their infantry fought with their shields fastened together by long chains; their horsemen, of whom they had 15,000, were well armed with helmet, coat of mail, shield, and spear. Marius had so chosen his position that the sun and dust were in their faces, and yet they contested the victory most bravely with the Romans, who were 55,000 strong When the battle was lost, the women, who remained in the camp formed of the wagons, killed themselves and their children. 140,000 C. are said to have fallen in the battle; the number of prisoners is given at 60,000. It is not till long afterwards, when the Romans themselves penetrated into Germany, that the name of the C. again appears. Cæsar represents the Aduatici of Belgium as the descendants of the C. and Teutones. Tacitus speaks of a people, bearing the name of C., few in number, but of great reputation, that sent ambassadors to Augustus. This people lived in the extreme north of Germany, on the borders of the ocean; according to Pliny and Ptolemy, at the extremity of the peninsula called from them the Cimbric Chersonese, now Jütland. The ethnology of the C. is doubtful. Greek writers associated them groundlessly, with the Cimmerians (q. v.); Sallust calls them Gauls; Cæsar, Tacitus, and Plutarch looked upon them as Germans, and the opinion of their German origin has been adopted by most moderns. Yet H. Müller, in his *Marken des Vaterlands* (1837), has endeavored to show that they belonged to the Celtic race, and lived originally on the north-east of the Belgæ, of kindred origin; and that their name is the same as that by which the Celts of Wales designate themselves to this day—*Cymri*.

CI'MEX AND CIMI'CIDÆ. See BUG.

CIMI'NNA, a town of Sicily, in the province of Palermo, 18 miles south-east of the city of that name. Pop. (1871) 5721.

CIMME'RIANS, or CIMME'RII, in the poems of Homer, the name of the people dwelling 'beyond the ocean-stream,' where the sun never shines, and perpetual darkness reigns.—But the historic C. were a people whose country lay between the Borysthenes (Dnieper) and the Tanais (Don), including also the Tauric Chersonesus (Crimea). The Cimmerian Bosporus (Strait of Yenikale) derived its name from them. Being driven out by the Scythians, they migrated to Asia Minor, dwelt there for some time, plundered Sardis, failed in an attempt upon Miletum, and were finally routed and expelled by the Lydian king Alyattes, some time after 617 B.C.

CI'MOLITE. See FULLERS' EARTH.

CI'MON, an Athenian commander, was the son of Miltiades, the conqueror at Marathon. In conjunction with Aristides, he was placed over the Athenian contingent to the allied fleet, which, under the supreme command of the Spartan Pausanias, continued the war against the Persians (477 B.C.). He effected the important conquest of Eïon, a town on the river Strymon, then garrisoned by the Persians. Later (according to Clinton, 466 B.C.), when commander-in-chief, he encountered a Persian fleet of 350 ships at the river Eurymedon, destroyed or captured 200, and defeated the land-forces on the same day. He succeeded likewise in driving the Persians from Thrace, Caria, and Lycia; and expended much of the money which he had obtained by the recovery of his patrimony in Thrace upon the improvement of the city of Athens. At this period he appears to have been the most influential of the Athenians. The hereditary enemy of Persia, it was his policy to advocate a close alliance with Sparta; and when the Helots revolted, he led an army upon two occasions to the support of the Spartan troops; but on the latter occasion, having lost the confidence of his allies, he was ignominously dismissed. After his return to Athens, his policy was opposed by the democracy, headed by Pericles, who procured his banishment by ostracism. He was recalled in the fifth year of his exile, and was instrumental in obtaining a five years' armistice between the Spartans and the Athenians. He died in the year 449 B.C., at the siege of a Cyprian town.

CINALO'A, a town of Mexico, in the state of the same name, on the Rio Cinalca, about 50 miles from its entrance into the Gulf of California. It is a thriving place, with gold-washings in the vicinity. Pop. about 9000.

CINCHO'NA (better spelt *chinchona*, it appears; see CHINCHON), a most important genus of trees of the natural order *Cinchonaceæ*; yielding the bark so much valued in medicine, known as Peruvian Bark, Jesuits' Bark, China Bark, Quina, Quinquina, Cinchona Bark, &c., and from which the important alkaloids *Quinia* or *Quinine* (q. v.), and *Cinchonia* or *Cinchonine*, are obtained. The species of this genus are sometimes trees of great magnitude; but an aftergrowth springing from their roots when they have been felled, they often appear only as large shrubs; and some of them in the highest mountain-regions in which they are found, are low trees with stems only eight or ten feet in height.

They exist only in South America, between S. lat. 20° and N. lat. 10°, and chiefly on the eastern slope of the second range of the Cordilleras. All the Cinchonas are evergreen-trees; with laurel-like, entire, opposite leaves; stipules which soon fall off; and panicles of flowers, which, in general appearance, are not unlike those of lilac or privet. The flowers are white, rose-colored, or purplish, and very fragrant. The calyx is small and 5-toothed; the corolla tubular with a salver-shaped 5-cleft limb. In the true *Cinchonas*, the capsule splits from the base upwards; the species in which it splits from above downwards from the sub-genus *Cascarilla;* the distinction acquiring importance from the consideration, that the barks of the former alone contain the alkaloids so valuable in medicine; and this property is further limited to those species which have the corolla downy or silky on the outside. Beyond the botanical limits thus narrowly marked out, not a trace of these alkaloids has yet been discovered anywhere.

Great difficulty has been found in determining the species by which the different varieties of C. bark known in commerce are produced. The common commercial names are derived partly from the color of the kinds, and partly from the districts in which they are produced, or the ports where they are shipped. It appears, however, to be now ascertained that *Calisaya Bark*, also called Royal or Genuine Yellow Bark, one of the very best kinds —mostly shipped from Arica—is chiefly the produce of *C. Calisaya*, a large tree, growing in hot mountain valleys of Bolivia and the south of Peru. To give all the varieties of bark and species of tree would go beyond our limits.

The accurate discrimination of the different kinds of bark requires much experience. The taste is always bitter; but it is possible even to distinguish by the taste those varieties which contain quinia most largely from those in which cinchonia is most abundant.

The cutting and peeling of C.-trees are carried on by Indians, who go in parties, and pursue their occupation during the whole of the dry season. They build a hut, which serves both for their abode and for drying the bark. The trees are felled as near the

root as possible, that none of the bark may be lost; and the bark being stripped off, is carefully dried; the quilled form of the thinner bark is acquired in drying. The bark is made up into packages of various size, but averaging about 150 lbs. weight, closely wrapped in woollen cloth, and afterwards in hides, to be conveyed on mules' backs to the towns. These packages are called drums or *seroons*. It is in them that the bark is always brought to Europe.

A number of spurious kinds of Peruvian or C. Bark are either sent into the market separately, or are employed for adulterating the genuine kinds. They are bitter barks, and have, in greater or less degree, febrifugal properties, but are chemically and medicinally very different from true C. bark. They are produced by trees of genera very closely allied to cinchona.

Whilst C.-trees have been becoming every year more scarce in their native regions, no attempt has been made to cultivate them there, notwithstanding the constantly increasing demand for the bark; but the Dutch have made extensive plantations in Java, and the same has been done in British India and Ceylon. The plantations in Jamaica, now yield bark superior to the best produce of Ceylon. Plantations have also been made in Trinidad, Mauritius, and St. Helena. See article PERUVIAN BARK; also Mr. Markham's book *Peruvian Bark* (1880).

The Indians of Peru call the C. trees *Kina*, from whence are derived the names *China*, *Quina*, &c. But it is not certain that they knew the use of the bark, before the arrival of Spaniards. It is a medicine of great value in the cure of intermittent fevers (see AGUE), and diseases attended with much febrile debility; also in certain forms of Neuralgia (q. v.), and other diseases of the nervous system. It seems to have been first imported into Europe in 1639, by the Countess Del Cinchon or Chinchon, the wife of the viceroy of Peru, who had been cured of an obstinate intermittent fever by means of it, and upon this account it was named *C. Bark* and *Countess's Powder* (*Pulvis comitissæ*). The Jesuit missionaries afterwards carried it to Rome, and distributed it through their several stations, and thus it required the name of *Jesuits Bark* and *Powder of the Fathers* (*Pulvis Patrum*). Cardinal Juan de Lugo having been particularly active in recommending and distributing it, it was also known as *Cardinal de Lugo's Powder*. It attained great celebrity in Spain and Italy, being sold at high prices by the Jesuits, by whom it was lauded as an infallible remedy, while by most of the orthodox physicians it was coldly received, and by the Protestants altogether repudiated. Its mode of action not being well understood, and the cases to which it was applicable not well defined, it seems, in the first instance, to have been employed without due discrimination, and to have fallen very much into the hands of empirics. Falling, however, into disuse in Europe, it was again brought into notice by Sir Robert Talbor or Talbot, an Englishman, who brought it to England in 1671, and acquired great celebrity through the cure of intermittents by means of it, and from whom Louis XIV. purchased his secret 1682. A pound of bark at that time cost 100 louis-d'or. Talbor seems to have been a vain and self-seeking man, but who had, nevertheless, the acuteness to discern and systematically to avail himself of the healing virtues of the neglected Jesuits' Bark, which he mixed with other substances, so as to conceal its taste and odor.

Soon afterwards, both Morton and Sydenham, the most celebrated English physicians of the age, adopted the new remedy; and its use, from this period, gradually extended, both in England and France, notwithstanding the opposition of the Faculty of Medicine in the latter country. As it came into general use, it became a most important article of export from Peru; but for a long time, the value of the bark to be procured in New Granada remained unknown; and in order to the maintenance of a commercial monopoly, extraordinary methods were even employed to prevent it from becoming known at a comparatively recent period of Spanish rule in America. The discovery of the alkaloids on which its properties chiefly depend, constitutes a new era in the history of this medicine, and did not take place till the beginning of the present century.

The chief active principles are the two alkaloids, Quinine (q. v.) and Cinchonine. The latter is not generally present in so large a proportion as the quinine, and does not possess such powerful medicinal properties. When isolated, the alkaloid *Cinchonia*, or Cinchonine, has the formula ($C_{40}H_{24}N_2O_2$), and can be obtained in a crystallized state.

C. Bark itself has, in later times, fallen into comparative disuse, owing to the discovery of the alkaloid quinine, which is now extensively in use in medicine in the form of sulphate or disulphate of quinine, and is given in doses of from one to twenty grains, in almost all the cases to which the bark was supposed to be applicable.

CINCHONA'CEÆ, a natural order of exogenous plants, consisting of trees, shrubs, and herbaceous plants, with simple, entire, opposite, or whorled leaves, and stipules between their footstalks. The calyx is adherent to the ovary; the corolla is tubular and regular, its segments are equal in number to those of the calyx, when the calyx is divided; the stamens arise from the corolla, and are alternate with its segments. The ovary is surrounded by a disk, and usually two-celled; the style single. the fruit either splitting into two halves or not splitting at all, either dry or succulent.—This order has been very generally regarded by botanists as a sub-order of *Rubiaceæ* (q. v.), but far exceeds all the rest of that order, both in the number and importance of its species, of which from 2500 to 3000 are known, mostly tropical, and the remainder, with few exceptions, sub-tropical. The C. are nearly allied to *Caprifoliaceæ* (woodbines or honeysuckles, &c.), and interesting relations have been pointed out between them and *Umbelliferæ*. They constitute a very large part of the flora of tropical regions.

Besides the genus *Cinchona* (q. v.) and other genera producing febrifugal barks—*Exostemma*, *Condaminea*, *Pinckneya*, *Portlandia*, &c.—the order produces a number of valuable medicinal plants, of which Ipecacuanha (q. v.) is the most important. The Coffee (q. v.) shrub belongs to it; and also the tree which yields Gambir (q. v.). It produces a number of plants employed in dying, among which are the Chay Root or Choya, and some species of *Morinda*. Some trees of this order yield valuable timber. Many of the species have beautiful and fragrant flowers; and some produce pleasant fruits, among which are the Genipap (*Genipa Americana*) of South America, the Native Peach (*Sarcocephalus esculentus*) of Sierra Leone, and the Voavanga of Madagascar *Vangueria edulis*).

CINCINNA'TI, the commercial capital of Ohio, is situated on the right bank of the river which gives name to the state, and separates it from Virginia and Kentucky. It stands in lat. 39° 6′ 30″ N., and in long. 84° 26′ W., 458 miles below Pittsburg, in Pennsylvania, where the Ohio, as such, is first formed, and 500 miles above the junction of that stream and the Mississippi. Though C. was founded in 1788, yet, in 1800, it had only 750 inhabitants. In the years 1820, 1830, 1840, 1850, and 1860 respectively, the census returns showed a population of 9602, 24,830, 46,338, 115,438, and 161,004. In 1870, it was 216,289; in 1880, 255,139, including a large proportion of Germans and Irish. The natural facilities of C. for commerce are great, and the Ohio River gives valuable carrying facilities. The Miami Canal unites C. with Lake Erie. Railways branch off from C. as a center in several directions. The advantage of rail over water is shown by the value of commerce exported in 1880–81; by railroad, the value was 207,700,000 dollars; by river, 45,800,000 dollars; by canal, 524,000 dollars.

The staple article of the trade of C. is the slaughter of swine and the packing of pork. C. has an extensive trade in wheat, flour, and maize. Wine from the Catawba (q. v.) grape is made in the neighborhood to a great extent. The city itself also is largely engaged in a variety of important manufactures, hundreds of steam-engines being employed in the different establishments. The manufactories include iron-foundries, rolling mills, lard, oil, and stearine factories, and countless works connected with flour, clothing, furniture, paper, printing, tobacco, soap, candles, hats, &c. In one average year, during the period 1870–80, it was computed that iron was produced to the value of 17,000,000 dollars; food, 24,000,000 dollars; clothing, 13,230,000 dollars; and liquors, 24,000,000 dollars. There are about 75 newspapers and periodicals, including 9 daily, of which 3 are in German.

C. is substantially and handsomely built. Its ecclesiastical, literary, and commercial edifices are as numerous as befits the acknowledged Queen of the West. The city occupies chiefly two terraces, which are elevated respectively 50 feet and 108 above the level of the river. For the supply of the inhabitants, the water of the Ohio has been lifted up into an immense reservoir, at an expense of about £160,000. A large suspension bridge, 100 feet above low water, connects the city with Covington in Kentucky. There are also two railway pier-bridges. Education flourishes, and there are numerous free schools.

CINCINNA'TI (the Cincinnatuses), a society or order in the United States of North America, established by the officers of the revolutionary army in 1783, 'to perpetuate their friendship, and to raise a fund for relieving the widows and orphans of those who had fallen during the war.' It was so named because it included patriots, headed by Washington, who in many instances had left rural affairs to serve their country (see CINCINNATUS). The badge of the society is a bald eagle suspended by a dark-blue ribbon with white borders, symbolizing the union of France and America. On the breast of the eagle there is a figure of Cincinnatus receiving the military ensigns from the senators, with the plough in the background; round the whole are the words, *Omnia reliquit servare rempublicam*. On the reverse, the same hero is represented crowned by Fame with a wreath on which is inscribed *virtutis præmium*, &c. As this distinction was made hereditary, it was

attacked, as opposed to republican equality. Franklin saw in it the germ of a future aristocracy, and at a meeting held in Philadelphia in 1784, several changes were made in the constitution of the society, and in several of the states it was quietly abolished. There are still however, several state societies, which hold a general meeting by delegates triennially.

CINCINNA'TUS, Lucius Quinctius, a Roman consul, regarded by the later Romans as the model of antique virtue and simple manners. So far as we can discern his character through the veil of legend, C. appears to have been a violent patrician. About 460 B.C., he was chosen consul, and two years later was made dictator. When the messengers from Rome came to tell C. of his new dignity, they found him ploughing on his small farm. He soon rescued the consul Lucius Minucius, who had been defeated and surrounded by the Æqui. Livy's account of the mode in which the deliverance was effected is rejected by Niebur, who points out the inconsistencies and impossibilities of the story, and seems disposed to regard the whole as a mere myth. We are next informed that, after a dictatorship of sixteen days, C. returned to his small farm on the Tiber. When 80 years old, he was once more made dictator (439 B.C.), and suppressed a threatened plebeian insurrection.

CI'NDER-BED, a name given by the quarrymen to a stratum of the Upper Purbeck series, almost entirely composed of the loosely aggregated shells of a small oyster (*Ostrea distorta*).

CINERA'RIA, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, very nearly allied to *Senecio* (Groundsel, Ragwort, &c.) from which it differs only in having the involucre formed of one row of equal erect scales. The species are numerous, and widely diffused over the world in various climates. They are annual or perennial herbaceous plants; with simple, generally toothed or sinuate leaves. Many of them are remarkable for the ashy appearance of the lower part of the leaves, whence their name (Lat. *cinis*, *-eris*, ashes). The leaves are often covered with a peculiar sort of down. Two small species are natives of the southern parts of Britain. The flowers of some are very pretty. *C. maritima*, a native of the south of Europe, and other species, have for some time been much cultivated in gardens and greenhouses. Many hybrids and varieties have been produced by cultivation.

CI'NERARY URNS (Lat. *cinis*, ashes) were used by the nations of antiquity to contain the ashes of the dead when gathered from the funeral pile. Previous to being deposited in the urn, the embers were soaked with wine; the urn was then placed in a

Fig. 1.

Fig. 2.

niche in the family mausoleum. Only the wealthy could afford so expensive a rite. C. U. were either sculptured in marble, or formed of clay or glass. They were not always in the form in which we commonly see them represented in modern tombs. Fig. 1 of the accompanying illustrations is the celebrated cinerary urn known by the name of the Portland or Barberini vase, preserved in the British Museum. This beautiful production of Greek art was discovered about the middle of the 16th c., in a marble sarcophagus (believed to be that of the Roman emperor Alexander Severus, 223—235 A.D.) at Monte del Grano, near Rome. The height of the urn is 10 inches. Fig. 2 is one of the finest specimens yet discovered in the British Isles, and is preserved in the museum of the Royal Irish Academy. It was found in a small stone chamber near Bagnalstown, county of Carlow. It is composed of very fine clay, and is but 2⅛ inches high. It contains the burnt bones of an infant or very young child.

CINI'SI, a town of Sicily, in the province of Palermo, 14 miles west-north-west of Palermo, near the coast. It is a neat, cheerful town, with straight, regular streets, and has 6714 inhabitants. The Benedictine convent here was once a feudal castle.

CI'NNA, Lucius Cornelius, a Roman noble, was one of the principal supporters of the faction of Marius. After Sulla had driven Marius from the city, and before setting out on his expedition against Mithridates, he allowed C. to be elected to the consulship. But C. had no sooner entered upon that office (87 B.C.), than he impeached Sulla, endeavored to form an interest among the citizens who had been added to Rome after the Social War, and agitated for the recall of Marius. The events which led to the return of Marius are stated in the article Marius (q. v.). After a cruel massacre of the Roman citizens, in which some of the most eminent statesmen and orators were slain, Marius and C. declared themselves consuls. On the death of Marius, which occurred within a few days of his usurpation, C. made L. V. Flaccus his colleague for that year, and C. P. Carbo for the two succeeding years. In 84 B.C., he prepared to meet Sulla, who was then on his way from the East to take vengeance upon his enemies, but was slain by his disaffected troops at Brundusium. During his fourth consulate, his daughter Cornelia had been married to Julius Cæsar.

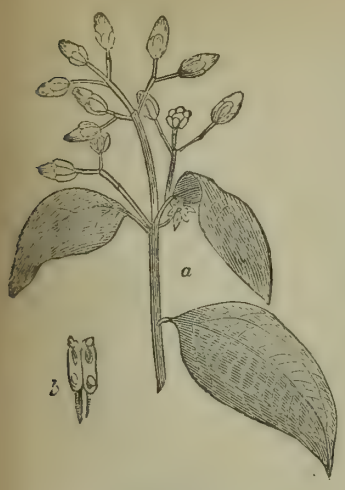
CI'NNABAR, an ore of mercury, from which almost all the mercury of commerce is obtained. Chemically, it is a bisulphuret of mercury, containing 86·2 parts of mercury and 13·8 of sulphur. It occurs both crystallized and massive, not unfrequently disseminated. Its crystals are six-sided prisms. It varies from perfectly opaque to almost transparent; has an adamantine almost metallic lustre, and a carmine color, with a bright scarlet streak. Its specific gravity is 8—8·2. *Hepatic C.*, so called from its liver-brown color, is a variety containing a little carbon. C. sometimes occurs in primitive rocks, but more frequently in those of the coal formation, and is sometimes even intimately mixed with coal itself. It is, however, a rare mineral, and is nowhere found in Britain. The C. mines of Almaden, in Spain, have been worked for about 2300 years, and are still the most productive in the world. At Almaden, the C. is found in a dark-colored slate mixed with quartzite. Next to the mines of Almaden, rank those of Idria in Carniola. C. mines exist also in Germany, Hungary, Peru, California, China, Japan, &c. C. is used as a pigment under the name of *Vermilion*.

CINNA'MIC ACID and the CINNAMYL SERIES. Cinnamyl is a compound radical, as yet unisolated, which is represented by the formula $C_{18}H_7O_2$, and which includes amongst its compounds cinnamic acid ($C_{18}H_7O_2$,HO), oil of cinnamon, which is chemically a slightly impure aldehyde of cinnamic acid, or a hydride of cinnamyl ($C_{18}H_7O_2$,H), chloride of cinnamyl ($C_{18}H_7O_2$,Cl), styrone or peruvine, known chemically as cinnamic alcohol ($C_{18}H_{10}O_2$), cinnamol and styrol, each represented by the formula $C_{16}H_8$, and styracin ($C_{18}H_{16}O_4$). We shall briefly notice the most important of these compounds—viz., cinnamic acid and oil of cinnamon. *Cinnamic Acid* ($C_{18}H_8O_4$) crystallizes in colorless prisms, which are sparingly soluble in cold water, but dissolve readily in boiling water, alcohol, and ether. It fuses at 266°, and boils with or without decomposition, according to the manner in which it is heated, at about 570°. It is converted by most decomposing agents into benzoyl compounds, such as benzoic acid, oil of bitter almonds, &c.; for example, when fused with hydrate of potash, it assimilates the elements of water, and breaks up into acetic and benzoic acids; when boiled with peroxide of lead, it is converted into oil of bitter almonds and benzoic acid, &c. It exists naturally in a free state in liquid storax, the balsams of Tolu and Peru, and gum benzoin, and is often deposited in large crystals from old samples of oil of cinnamon and from cinnamon water. It is always formed from oil of cinnamon when the latter is exposed to the action of the air, and it has been synthetically or artificially formed by exposing equivalent quantities of chloracetyl ($C_4H_3O_2Cl$) and oil of bitter almonds ($C_{14}H_6O_2$) to a prolonged heat in a closed glass tube. *Oil of Cinnamon* and *Oil of Cassia*, although prepared from different kinds of trees, are virtually identical in their composition, each consisting mainly of cinnamic aldehyde, or hydride of cinnamyl, mixed with certain resinous matters. Oil of cinnamon is an article of the materia medica, and in doses of one minim to a five-grain pill, forms an excellent aromatic addition to cathartic pill-masses.

CI'NNAMON is the spicy, aromatic, and stimulating bark of certain species of the genus *Cinnamomum*. This genus belongs to the natural order *Lauraceæ*, and was formerly included in *Laurus*. It contains a considerable number of species, natives of tropical and subtropical parts of the East. C. has been in use from the remotest antiquity. It is mentioned in the Old Testament, and by a name almost the same as that which it still bears in most languages.

The finest kind is said to be chiefly produced by *Cinnamomum Zeylanicum* (formerly, *Laurus Cinnamomum*), which chiefly grows in the island of Ceylon, although, having been introduced into the West Indies in 1782, along with various other plants of the East,

it is now cultivated there to some extent. The tree attains the height of 20—30 feet, and is sometimes 1½ foot in thickness. Its bark is of a grayish-brown color, internally of a yellowish red. The leaves are oval, 4—6 inches long, with a blunt point, and marked with three principal nerves. They have the taste of cloves. The flowers are of a silky gray on the outside, and a pale-yellowish color internally. The fruit is somewhat like an acorn in shape; it is a small drupe, brown when ripe. There are two seasons of cinnamon-harvest in Ceylon, the first commencing in April, and the last in November—the former being that in which the chief crop is obtained. The branches of 3—5 years' growth being cut down, the epidermis is scraped away; the bark is then ripped up longitudinally with a knife, and gradually loosened, till it can be taken off. The slices are then exposed to the sun, when as it dries, it curls up into *quills*, the smaller of which are inserted into the larger, and the whole tied up in bundles of about 88 lbs. each. C. is examined and arranged according to its quality by persons who are obliged for this purpose to taste and chew it, although in a short time it produces painful effects on their mouths and tongues. The finest C. is yielded by the young branches of the tree, especially by the numerous shoots which spring up from the stump after a tree has been cut down, and which are cut when about 10 feet long, and of the thickness of an ordinary walking-stick. The smell, particularly of the thinnest pieces, is delightfully fragrant, and the taste pungent and aromatic, with a mixture of sweetness and astringency. It is used like other spices by cooks and confectioners, and also in medicine as a tonic, stomachic, and carminative. The average quantity annually imported into London is about 500,000 lbs. Its virtues depend chiefly upon the essential oil which it contains (*Oil of Cinnamon*).



Cinnamon:
a, end of branch, with leaves and flowers; *b*, four-celled anther.

Oil of cassia is very often substituted for this oil, as cassia—which, however, may readily be distinguished by its mucilaginous taste—is for cinnamon. The root of the C.-tree contains camphor. The fruit yields a concrete oil, called *Cinnamon Suet*, which is highly fragrant, and in Ceylon was formerly made into candles, for the exclusive use of the king.—CASSIA (q. v.) is the produce of another species of *Cinnamomum*.—*C. Loureirii*, a native of Cochin China and Japan, is said to yield a bark even superior to that of *C. Zeylanicum*. A species of C., which ascends to the elevation of 8500 feet in the Sikkim Himalaya, deserves a trial even in the climate of Britain.

The constituents of C. are a volatile oil (*Oil of C.*), tannin, starch, mucilage, woody-fibre, resin, coloring matter, and an acid. The oil of C. is generally prepared in Ceylon by grinding the coarsest pieces of C., soaking them in sea-water for two or three days, and then distilling. Two oils pass over, one lighter, the other heavier than water. Oil of C. varies in color from yellow to cherry red, the yellow variety being considered the best, and is most highly esteemed. *Oil of C. leaf* is prepared from the leaves in Ceylon by a similar process, and is met with in commerce under the name of *clove oil*, which it much resembles in odor. *C. water* is obtained by adding water to C., and distilling a large quantity, or by diffusing the *oil of C.* through water by the aid of sugar or carbonate of magnesia. *Spirit of C.* is procured by acting upon C. with spirit of wine and water, and distilling; and *tincture of C.*, by soaking C. in spirit of wine, and straining. The medicinal properties of C., and its preparation, are aromatic and carminative, and it is serviceable in cases of nausea and vomiting, and in cases of flatulence and spasmodic states of the stomach and alimentary canal.

CI'NNAMON-STONE, a precious stone of which the finer specimens are highly esteemed; it is regarded as a variety of Garnet (q. v.). Its color varies from hyacinth red to orange yellow; and when pure, it is transparent. It is composed essentially of silica, alumina, and lime. It is found chiefly in Ceylon, where vast boulders of gneiss containing it in profusion exist in many places.

CI'NNYRIS. See SUN-BIRDS.

CI'NQUÉ CE'NTO (Ital.), five hundred. A technical, or rather *slang* artistic term, used to designate the style of art which arose in Italy after the year 1500, and which therefore belongs to the 16th c.; i. e., after the fall of all the great schools. It is sensuous in its character, the subjects chosen being usually borrowed from heathen mythology or history.

CI'NQUEFOIL, in Botany. See POTENTILLA.

CINQUEFOIL, a common bearing in heraldry. It is usually depicted with the leaves issuing from a ball as a center point.—C., in architecture, is an ornamental foliation in five compartments,

Cinquefoil:—In Heraldry.

Cinquefoil:—In Architecture.

used in the tracery of windows, panellings, and the like. The C. is often represented in a circular form, the spaces between points or cusps representing the five leaves, as in the accompanying illustration.

The C. of heraldry and of architecture is not derived from any leaf of five leaflets, but, as its perfect regularity of form indicates, from the flower of the plant called C. (*Potentilla*), or other similar flower of five petals or *leaves*. The C. thus closely resembles the rose, with which it would, indeed, be identified, but that a double and not a single rose is chosen for the purposes of heraldry and decorative art.

CINQUE PORTS (Fr. five ports). It is said that the five maritime ports of England lying opposite to the coast of France—Sandwich, Dover, Hythe, Romney, and Hastings—were enfranchised in the time of Edward the Confessor. But it was subsequent to the battle of Hastings that the Conqueror, in order that he might wield the resources of the seaports with greater vigor, constituted this whole line of coast into a jurisdiction entirely separate from the counties of Kent and Sussex, and erected it into a sort of county palatine, under a warden or guardian, the seat of whose administration was in Dover Castle. The warden, whose office corresponded to that of the ancient count of the Saxon coast (*Comos littoris Saxonica*), exercised jurisdiction, civil, military, and naval, uniting in his single person the functions of sheriff, custos rotulorum, lord-lieutenant, and admiral. Privileges equal to those originally bestowed on the C. P. were subsequently extended to the so-called *ancient towns* of Winchelsea and Rye; and most of the municipal towns had subordinate ports and towns attached to them, which were called *members*. In place of the Saxon terms of *aldermen* and *freemen*, those of *jurats* and *barons* were introduced, and the latter term has always been applied to the representatives of the C. P. in parliament. The chief function performed by the C. P. in early times consisted in furnishing such shipping as was required for the purposes of the state, the crown having possessed no permanent navy previous to the reign of Henry VII.

In the time of Edward I., they were bound to provide no less than 57 ships, fully equipped and manned at their own cost; though the weight of this heavy burden was somewhat lessened by the provision, that the period of gratuitous service should be limited to 15 days. In consequence of the warlike navy which they were thus compelled to maintain, the C. P. became so confident in their strength, and so insolent and audacious as not only to undertake piratical expeditions, but even to make war and form confederacies as independent states. Previous to the Revolution of 1688, the lord-wardens were in use to nominate the barons, or parliamentary representatives of the C. P.; but in 1689, an act was passed to 'declare the right and freedom of election of members to serve in parliament for the cinque ports.' The Reform Bill of 1832 reduced the number of members sent to parliament by the C. P. from 16 to 8, and the Municipal Reform Act has broken up the ancient organization of the ports, and assimilated their internal arrangements to those of other English municipalities. The ancient courts of Stepway, Brotherhood, and Guestling are still occasionally held, but their powers scarcely extend beyond matters of form, such as appointing the barons, who are to exercise an ancient privilege of the ports, which consists in carrying the canopy over the sovereign's head at a coronation. The lord-warden's jurisdiction, in relation to civil suits and proceedings, was abolished by 18 and 19 Vict. c. 48, amended by 20 and 21 Vict. c. 1.

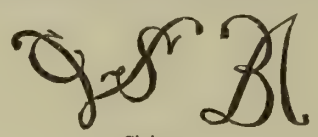
CI'NTRA, a small but picturesquely situated town in Portugal, in the province of Estremadura, about 15 miles west-north-west of Lisbon, with a population of 4000. It stands on the declivity of the Sierra de Cintra, and is surrounded by country residences. There is a palace at C., a strange mixture of Moorish and Christian architecture, anciently occupied by the Moorish kings, and subsequently a favorite residence of the Christian monarchs. A charming view of the town and of the sea is to be had from the top of a hill crowned with the ruins of a Moorish castle. On an-

other hill-top stands La Penna, once a convent, now a residence of the king of Portugal, who has restored and given it the outward appearance of a feudal castle. In the neighborhood, also, is what is called the Cork Convent, which derives its name from the cells—which are cut out in the rock—being lined with cork to prevent damp.

C. is historically remarkable for the *Convention* concluded here, August 22, 1808, between the English and French, by which the latter agreed to evacuate Portugal. Junot had been defeated by Sir Arthur Wellesley at Vimieira, and had retreated towards Torres Vedras and Lisbon, whither the English under Sir Hew Dalrymple, who had just arrived and assumed the chief command, were preparing to follow them. But the French, despairing of finally holding out, agreed to evacuate the country, on condition of not being treated as prisoners of war, but landed on the coast of France, retaining their arms and effects. This convention excited the greatest public indignation both in the Peninsula and in England. Several English newspapers appeared in mourning, and the ministry were obliged to have the generals who signed the convention tried by a court-martial, which, however, resulted in their acquittal. In fact, though the terms of the convention might be advantageous for the French, to obtain immediate possession of Portugal and Lisbon, instead of being put to the necessity of a bloody siege for months, was no less advantageous to the English and their allies. Such, at least, was the opinion of two competent judges—Napoleon and Wellington.

CIOTAT, La, a town of France, in the department of Bouches-du-Rhone, situated on the west side of a bay in the Mediterranean, about 15 miles south-east of Marseille, in the midst of a district clad with olive, orange, and pomegranate plantations. It is well built, and has a good and commodious harbor, formed by a mole, and well defended. The industry consists in cotton-spinning, ship-building, and an active trade in the produce of the district. Pop. (1876) 8104.

CI'PHER, an ornamental arrangement of the initial letters of a name, by which they become also a private mark, adopted by artists and architects as distinctive of their work. That of Albrecht



Ciphers

Dürer is well known. Of those given in the illustration, the first is that of Christopher von Sichem; the second, that of Adrian Bolswert.

CI'PHER-WRITING. See Cryptography.

CIPRIA'NI, Giambattista, painter and copper-engraver, was born in Florence 1732, or, according to others, in 1727, and when 19 years old, went to Rome, where he chose Correggio as a model, and soon gained a high reputation. Invited by certain English residents in Rome, the artist came to London about 1754, where he was one of the first members of the Royal Academy (founded 1769), and died in 1785. His drawing is correct, his coloring harmonious, his heads have grace and loveliness, and the general style of his works is attractive, although exceedingly conventional. A series of small copperplate illustrations of *Orlando Furioso* well exemplifies his graceful style. Several of Bartolozzi's best engravings are in C.'s manner.

CIRCÆ'A (from *Circe*, q. v.), a genus of rather pretty little herbaceous plants of the natural order *Onagraceæ*, with a deeply 2-cleft calyx, a corolla of two petals, and two stamens. *C. Lutetiana* is frequent in shady situations in Britain, and in most parts of the continent of Europe. It bears the English name of Enchanter's Nightshade, and in Germany it is called Hexenkraut (Witches' Herb). The origin of such names is not easily explained. The plant possesses no remarkable properties, being merely a little astringent. Other species are found in the Himalaya, &c.

CIRCASSIA, a division of the Western Caucasus, comprising the north, and also a portion of the south slope of that mountain-range extending in latitude 42°—45° N., and longitude 37°—47° E. See Caucasus.

CIRCASSIANS, in the wide sense of the term, is the name given to all the independent tribes of the Caucasus; in a narrower sense, it denotes the tribes who inhabited the western part of the range which is called, in consequence, Circassia. The C. proper, however, occupied only the north-western wing of the Caucasus, with the exclusion of Abasia, or the portion between the Black Sea in the west and the lower bank of the river Kuban in the north. They call themselves Adighé, but the Russians and Turks call them *Tcherkesses*. On their conquest by Russia in 1864, rather than remain in subjection to that power they chose to emigrate to Turkey, and from 400,000 to 500,000, or nearly the whole nation of fifteen tribes, carried this resolution into effect. The greater part of them were distributed over the Turkish possessions in Asia Minor, but others were settled in the mountainous parts of Bulgaria and on the borders of Servia. In their original country they were a marauding and warlike people, amongst whom it was held more honorable to live by plunder than by peaceful industry. In common with all brigand tribes, the C. cherished the most unrestrained love of independence. Their government was a singular compound of constitutionalism and feudalism. There were five distinct ranks in the nation—viz., chiefs or princes, nobles, common freemen, dependants, and slaves. The class of common freemen made up the great mass of the people; they possessed property, and enjoyed the same political rights as the nobles. The fourth class, the dependants, were the vassals of the princes and nobles, whose lands they cultivated, and whose armies they formed. Yet their lord had no right over their persons; for in some cases they and their whole families left him; and they could only be sold as slaves for punishment according to the previous verdict of a national assembly. The fifth class comprised the slaves, or those who had been made captive in war. That the C. have not lost some of the worst traits of their natural character since their settlement in Turkey is shown by their participation in the Bulgarian massacres of 1876 and 1877.

The C. princes and nobles are principally Mohammedans, whilst the great mass of the people have a religion which is a kind of mixture of Christianity and paganism, in which the celebration of Easter, the sign of the Cross, sacred trees, sacrifice, and processions with lights, play an important part. Besides agriculture and the rearing of cattle, they possess a few other branches of industry. The C. are proverbially handsome; they are also strong, active and temperate, and are characterized by the higher attributes of self-dependence, courage, and prudence. As a nation they made their first historical appearance during the middle ages. They are, however, chiefly known through their long struggles to maintain their independence against the aggression of Russia. See Caucasus. For their place in ethnology, see Caucasian Variety of Mankind.

CI'RCÉ, a fabulous sorceress, is described by Homer as 'fair-haired, a clever goddess, possessing human speech,' sister of 'all-wise Æætes,' daughter of 'the Sun, who gives light to mortals, and of Perse, whom Ocean begot as his daughter.' Round her palace in Ææa were numbers of human beings, whom she had changed into the shapes of wolves and lions by her drugs and incantations. She changed two-and-twenty of the companions of Ulysses into swine; but that hero, having obtained from Mercury the herb *Moly*, went boldy to the palace of the sorceress, remained uninjured by her drugs, and induced her to disenchant his comrades. He remained with her for a year; and when he departed she instructed him how to avoid the dangers which he would encounter on his homeward voyage (*Odyssey*, Books x. and xii.). Jealous of Scylla, whose love was sought by Glaucus, she poured the juice of poisonous herbs into that part of the sea where her rival was accustomed to bathe, and changed her into a hideous monster (*Metamorphoses*, Book xiv. fables 1 and 6).

CI'RCLE, a plane figure bounded by a curved line, which returns into itself, called its *circumference*, and which is everywhere equally distant from a point within it called the *center* of the circle. The circumference is sometimes itself called the C., but this is improper; C. is truly the name given to the space contained within the circumference. Any line drawn through the center, and terminated by the circumference, is a *diameter*. It is obvious that every diameter is bisected in the center. (See Arc, Chord.) In Co-ordinate Geometry, the C. ranks as a curve of the second order, and belongs to the class of the conic sections. It is got from the right cone by cutting the cone by a plane perpendicular to its axis. The C. may be described mechanically with a pair of compasses, fixing one foot in the center, and turning the other round to trace out the circumference. The C. and straight line are the two elements of plane geometry, and those constructions only are regarded as being properly geometrical which can be effected by their means. As an element in plane geometry, its properties are well-known and investigated in all the text-books. Only a few of the leading properties will here be stated.

1. Of all plane figures, the C. has the greatest area within the same perimeter.

2. The circumference of a C. bears a certain constant ratio to its diameter. This constant ratio, which mathematicians usually denote by the Greek letter π, has been determined to be 3·14159, nearly, so that, if the diameter of a C. is 1 foot, its circumference is 3·14159 feet; if the diameter is 5 feet, the circumference is $5 \times 3{\cdot}14159$; and, in general, if the diameter is expressed by $2r$ (twice the radius), then c (circumference) $= 2r \times \pi$. Archimedes, in the book *De Dimensione Circuli*, first gave a near value to the ratio between the circumference and the diameter, being that of 7 to 22. Various closer approximations in large numbers were afterwards made, as, for instance, the ratio of 1815 to

5702. Vieta, in 1579, showed that if the diameter of a C. be 1000, &c., then the circumference will be greater than 3141·5926535, and less than 3141·5926537. This approximation he made through ascertaining the perimeters of the inscribed and circumscribed polygons of 393,216 sides. By increasing the number of the sides of the polygons, their perimeters are brought more and more nearly into coincidence with the circumference of the circle. The approximation to the value of π has since been carried (by M. de Lagny) to 128 places of figures. It is now settled that π belongs to the class of quantities called *Incommensurable* (q. v.), i. e., it cannot be expressed by the rato of any two whole numbers, however great. In general, it may be considered that 3·14159 is a sufficiently accurate value of π.

Though the value of π was at first approached by actually calculating the perimeter of a polygon of a great number of sides, this operose method was long ago superseded by modes of calculation of a more refined character, which, however, cannot here be explained. Suffice it to say that various series were formed expressing its value; by taking more and more of the terms of which into account, a closer and closer approach to the value might be obtained. We subjoin one or two of the more curious.

$$\pi = 4\left(1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \&c.\right)$$

$$\pi = 8\left(\frac{1}{1\cdot3} + \frac{1}{3\cdot5} - \frac{1}{3\cdot5\cdot7} + \frac{1}{5\cdot7\cdot9} - \frac{1}{7\cdot9\cdot11} + \frac{1}{9\cdot11\cdot13} - \&c.\right)$$

3. The area of a C. is equal to π multiplied by the square of the radius ($= \pi r^2$); or to the square of the diameter multiplied by $\frac{\pi}{4}$ i. e, by ·7854. Euclid has proved this by showing that the area is equal to that of a triangle whose base is the circumference, and perpendicular height the radius of the circle.

4. It follows that different circles are to one another as the squares of their radii or diameters, and that their circumferences are as the radii or diameters.

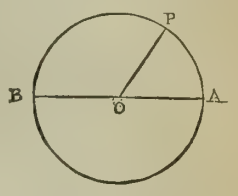
The C. is almost always employed to measure angles, from its obvious convenience for the purpose, which depends on the fact demonstrated in Euclid (Book iv. Prop. 33), that angles at the center of a C. are proportional to the arcs on which they stand. It follows from this, that if circles of the same radii be described from the vertices of angles as centers, the arcs intercepted between the lines, including the angles, are always proportional to the angles. The C. thus presents us with the means of comparing angles. It is first necessary, however to graduate the C. itself; for this purpose, its circumference is divided into four equal parts, called *quadrants*, each of which obviously subtends a right angle at the center, and then each quadrant is divided into degrees, and each degree into minutes, and so on. The systems of graduation adopted are various, and will now be explained.

The sexagesimal scale is that in common use. According to it, each quadrant or right angle being divided into 90 *degrees*, each degree is divided into 60 seconds, and each second into 60 thirds, and so on. According to this scale, 90° represents a right angle; 180°, two right angles, or a semicircle; and 360°, four right angles, or the whole circumference—the unit in the scale being the $\frac{1}{90}$th of a right angle. As the divisions of the angles at the center, effected by drawing lines from the center to the different points of graduation of the circumferance, are obviously independent of the magnitude of the radius, and therefore of the circumference, these divisions of the circumference of the C. may be spoken of as being actually divisions of angles. By laying a graduated C. over an angle, and noticing the number of degrees, &c., lying on the circumference between the lines including the angle, we at once know the magnitude of the angle. Suppose the lines to include between them 3 degrees, 45 minutes, 17 seconds, the angle in this scale would be written 3° 45′ 17″.

It is obvious, however, that the division of the quadrant into 90 degrees instead of any other number, is quite arbitrary. We may measure angles by the C., however we graduate it. Many French writers, accordingly, have adopted the

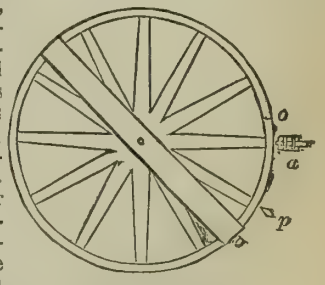
Centesimal Division of the Circle.—In this division, the right angle is divided into one hundred degrees, while each degree is divided into one hundred parts, and so on. This is a most convenient division, as it requires no new notation to denote the different parts. Such a quantity as 3° 45′ 17″ is expressed in this notation by 3·4517. the only mark required being the decimal point to separate the degrees from the parts. Of course, in this illustration, 3° means 3 centesimal divisions of the right angle, and 45′ means 45 centesimal minutes, and so on. If we want to translate the quantity 3° of the common notation into the centesimal notation, we must multiply 3 by 100, and divide by 90. To translate minutes in the common notation into the centesimal, the rule is to multiply by 100, and divide by 54. There remains yet another mode of measuring angles, known as the

Circular Measure.—The circular measure of angles is in frequent use, and depends directly on the proposition (Euc. vi. 33), that angles at the center of a C. are proportional to the arcs on which they stand. Let POA be an angle at the center O of a C., the radius of which is r; APB a semicircle whose circumference accordingly $= \pi r$; and let the length of the arc AP $= a$. Then, by Euclid $\frac{\text{angle POA}}{\text{2 right angles}} = \frac{a}{\pi r}$; and $\angle \text{POA} = \frac{\text{2 right } \angle \text{s}}{\pi} \cdot \frac{a}{r}$. Now, supposing a and r to be given, although the angle POA will be determined, yet its numerical value will not be settled unless we make some convention as to what angle we shall call unity. We are free to make any convention we please, and therefore choose such a one as will render the preceding equation the most simple. It is made most simple if we take $\frac{\text{2 right angles}}{\pi} = 1$. We shall then have (denoting the numerical value of the angle POA by θ) $\theta = \frac{a}{r}$. The result of our convention is, that the numerical value of two right angles is π, instead of 180°, as in the method of angular measurement first alluded to; and the unit of angle, instead of being the ninetieth part of a right angle, is $\frac{\text{2 right angles}}{\pi}$, or 57°, 17′ 44″ 48‴ nearly. Making $\theta = 1$ in the equation $\theta = \frac{a}{r}$, we have a (or AP) $= r$ (or AO), which shows that in the circular measure, the unit of angle is that angle which is subtended by an arc of length equal to radius. It is frequently a matter of indifference which mode of measuring angles is adopted; the circular measure, however, is generally the most advantageous, as being the briefest. It is easy to pass from this mode of measurement to the sexagesimal. If θ be the circular measure of an angle, the angle contains $\frac{\theta}{\pi}$. 180 degrees; conversely, if an angle contain $n°$, its circular measure is $\frac{n}{180}.\pi$.



CIRCLE, Magic, a space in which sorcerers were wont, according to the ancient popular belief, to protect themselves from the fury of the evil spirits they had raised. This C. was usually formed on a piece of ground about nine feet square (in the East, seven feet appears to have been considered sufficient), in the midst of some dark forest, churchyard, vault, or other lonely and dismal spot. The C. was described at midnight in certain conditions of the moon and weather. Inside the outer C. was another somewhat less, in the center of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which enclosed the larger one, were filled 'with all the holy names of God,' and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this C., the magician, it was believed, would have been carried off by the spirits as he would have been, had he by chance got out of the charmed space.

CIRCLE, Mural, an instrument used for determining the meridian altitude or zenith distance of a star. It consists of an astronomical telescope firmly fixed to a graduated circle, which moves about a horizontal axis, fixed in a strong vertical wall running north and south. In the common focus of the eye-piece and the object-glass of the telescope is a system of cross-wires (spider lines are generally used for the purpose), one being horizontal, and five vertical, with equal spaces between. The line joining the optical center of the object-glass with the intersection of the horizontal and middle vertical wires, is called the line of *collimation* of the telescope, and when the instrument is in perfect adjustment, this line moves in the plane of the meridian.



Mural Circle.

Besides the above-mentioned fixed wire, there is a movable one, called a micrometer wire, which is moved by means of a screw, remaining always parallel to the fixed horizontal wire.

If the instrument be so adjusted that the image of a star, while passing across the middle vertical wire in the field of view, shall at the same time be bisected by the fixed horizontal wire, the star is at that moment in the line collimation of the telescope. It is therefore at that moment in the meridian, and its meridian zenith distance is the angle through which the circle would have been turned from the position it had when the line of collimation of the telescope pointed to the zenith. There is a fixed pointer, p, for the purpose of approximately reading the instrument. If the instrument were accurately adjusted, so that p was opposite the

zero point of the circle, when the line of collimation of the telescope pointed to the zenith, the arc *op*, in the above position of the instrument, would be the meridian zenith distance of the star.

Great nicety is required in 'reading' the instrument; i. e., in determining exactly the arc through which the circle has moved in bringing the telescope from the vertical to any other position, such as that represented in the figure.

The rim is usually graduated at intervals of five minutes; and the eye could determine only the division nearest to the fixed index *p*. But by means of a 'reading microscope,' or Micrometer (q. v.), fixed opposite to the rim, as at *a* (the distance between the axis of which and the point *p* is constant), the portion of the interval to the nearest division on the rim can be read to seconds. There are usually six such microscopes fixed opposite different points of the rim; and the 'reading' of the instrument is the mean of the 'readings' of all the microscopes. This tends to eliminate errors arising from imperfect graduation and adjustment. If the instrument is properly adjusted, the zero point of the circle will be at *p* when the line of collimation of the telescope points to the zenith. In practice, however, this is not always accurately, or even approximately the case. As we shall immediately show, it is of no consequence as the final result of every observation is the *difference* between two readings.

It is evident that the difference between any two readings of the instrument will represent the angle through which the line of collimation of the telescope moves in passing from one position to the other. It remains to show how a fixed point—viz., the Nadir (q. v.), is observed, and then how an observation is taken of the star itself in its meridian passage.

We must explain here that the fixed horizontal wire in the eye-piece of the telescope, in the instruments as now used, is only an *imaginary* line which determines the line of collimation of the telescope. It coincides with the position of the micrometer wire, when the screw-head of the micrometer marks zero.

To observe the nadir, a trough of mercury is placed underneath the instrument, and the telescope is turned so as to look vertically downwards into it. An image of the system of cross-wires which is in the common focus of the object-glass and eye-piece, will be reflected back again to nearly the same focus. Looking into the telescope, the observer now adjusts it by means of a tangent screw till the reflected image of the horizontal wire coincides with the real one. The final adjustment is perhaps most delicately effected by turning the screw-head of the micrometer which moves the wire itself. When they coincide, the line joining the center of the object-glass of the telescope with the intersection between the middle vertical and horizontal micrometric wire, will be vertical. Now, the angle between this and the line of collimation of the telescope, which, as we have said, joins the optical center of the object-glass with the intersection of the middle vertical and imaginary fixed horizontal wire, will, if the micrometer is in proper adjustment, be at once read off the micrometer screw-head. The instrument being clamped as above adjusted, the microscopes are read off, and the reading of the micrometer screw-head above mentioned being added to or subtracted from this reading, as the case may be, the nadir reading of the instrument is determined. The zenith reading, therefore, which differs from it by 180°, is at once known.

Again, to observe a star in the meridian, the instrument is previously adjusted so that the star, in passing the meridian, shall pass over the field of view of the telescope. As the image of the star approaches the center of the field, the observer adjusts the telescope by the tangent screw, so as very nearly to bring the image of the star to the horizontal wire. Finally, just as the star passes the middle vertical wire, he bisects the image of the star with the horizontal wire by a touch of the micrometer screw-head. The circle being now clamped (or made fast), the 'reading' is determined as before by reading the pointer and microscopes, and adding or subtracting, as the case may be, the reading of the micrometer. This reading now substracted from the zenith-reading gives the meridian zenith distance of the star; and this, again, subtracted from 90°, gives its meridian altitude above the horizon.

At the Royal Observatory of Greenwich, the principal observations are now made by an instrument which combines the mural C. with the transit instrument. See TRANSIT INSTRUMENT.

CIRCLE, QUADRATURE OF. See QUADRATURE.

CIRCLES OF THE SPHERE. See ARMILLARY SPHERE.

CI'RCUITS (Fr. *circuit*; Lat. *circuitus*, a going round). IN ENGLAND.—England and Wales, with the exception of the county of Middlesex, are divided, for judicial purposes, into seven C., which the judges of the High Court of Justice visit four times a year in pairs for the purpose of adjudging civil and criminal causes. The number of C. was reduced from eight to seven by authority of the Judicature Act, 1875. They are—the Northern, North-eastern, Midland, South-eastern, Oxford, Western, and North and South Wales. Trials by jury of issues of fact within London and Middlesex are held at what are called the London and Middlesex Sittings. Criminal charges within that and surrounding district are disposed of at sessions which are held monthly at the Central Criminal Court. 'These judges of assize came into use in the room of the ancient justices of eyre, *justiciarii in itinere*, who were regularly established, if not first appointed, by the parliament of Northampton, 1176 A.D., in the twenty-second year of Henry II., with a delegated power from the king's great court, or *aula regia*, being looked upon as members thereof.'—Stephen's *Com.*, volume iii. page 415. See ASSIZE and NISI PRIUS.—IRELAND is divided into the North-east, the North-west, the Home, the Leinster, Connaught, and Munster circuits. For the Scottish Circuits, see the article JUSTICIARY COURT.

CIRCULAR NOTES are bank-notes specially adapted for the use of travelers in foreign countries; and being, in fact, bills personal to the bearer, they are believed to be more safe as traveling money than ordinary notes or coin. C. N. are furnished by the chief London banking-houses. Those who wish to obtain them, determine beforehand what sum of money they will require on their journey, and that they pay to their banker, who, in exchange, gives C. N. to the amount, each of the value of £10 and upwards. Along with these notes is given a 'letter of indication.' This letter (a lithographed form in French) is addressed to foreign bankers, requesting them to pay the notes presented by the bearer, whom they name, and to aid him in any way in their power. By way of verification, the bearer appends his signature, and the letter is complete. On the back of the letter there is a long list of foreign bankers, extending all over Europe, any of whom will cash one or more of the C. N., on being presented and indorsed by the bearer; the indorsement being of course compared with the signature on the letter of indication, which is at the same time exhibited. In paying these notes, the money of the country is given, according to the course of exchange, and free of any charge for commission. For security, the letter and the notes should not be carried together, in case of being stolen or lost. These C. N. are doubtless a safe and convenient species of money, exchangeable in almost every town visited; and if any remain over on coming home, they will be taken back at their value by the banker who issued them. There are, however, certain drawbacks connected with these notes, which every traveler less or more experiences. In many, almost in all, instances, there is a difficulty in finding out where the banker named is to be found; for foreign bankers generally occupy obscure apartments several stories high, and not unusually in dingy out-of-the-way alleys. To discover them, a commissionaire may be necessary. Then, in some instances, it happens that the banker jealously scrutinizes the bearer, asks to see his passport, and takes a note of the hotel at which he lodges; all which may be proper as a precaution against roguery, but it is not pleasant. Further, the C. N. are ordinarily of a thick stiff kind of paper, which does not well fit into a purse or pocket-book. On these several accounts, the careful class of travelers who keep to the main thoroughfares of France, Germany, and Belgium, will find £5 or £10 Bank of England notes, and sovereigns or napoleons, a preferable kind of money to take on their journey.

CI'RCULAR NU'MBERS are numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

CIRCULAR PARTS, the name given to a rule in spherical trigonometry, invented by Lord Napier. It is to be found in any treatise on that subject.

CIR'CULATING DE'CIMALS. See DECIMALS.

CIRCULATING LIBRARY, a collection of books lent out on hire—circulated from hand to hand. The plan of lending books on hire is not new. Chevillier, in his *Origines de l'Imprimerie de Paris* (4to, 1694), mentions that, in 1342, a century before the invention of printing, a law was framed in Paris to compel stationers to keep books to be lent on hire, for the special benefit of poor students and others. This fact is alluded to as follows, by E. S. Merryweather, in his entertaining work, *Bibliomania in the Middle Ages* (London, 1849): 'The reader will be surprised at the idea of a circulating library in the middle ages, but there can be no doubt of the fact, they were established at Paris, Toulouse, Vienna, and other places. These public librarians, too, were obliged to write out regular catalogues of their books, and hang them up in their shops, with the prices affixed, so that the student might know beforehand what he had to pay for reading them.' This writer, quoting from Chevillier, gives a list of books so lent out, with the prices for reading them. The books are all of a theological or classical kind. Among them is the Bible, the perusal of which is set down at 10 sous. 'This rate of charge,' it is added, 'was also fixed by the university, and the students borrowing these books were privileged to transcribe them, if they chose; if any of them proved imperfect or faulty, they were denounced by the university, and a fine was imposed upon the bookseller who had

lent out the volume.' In these arrangements, we see the efforts that were made to procure the use of books before the art of printing had cheapened the cost of literature.

By whom the modern C. L. was projected, there is no record. All that can be given are a few facts on the subject. It is known that Allan Ramsay, author of *The Gentle Shepherd*, who was a bookseller in Edinburgh, established a C. L. in that city about 1725. Fond of dramatic literature, Ramsay appears to have incurred some local obloquy by lending out plays; and his wish to introduce a taste for the drama into Edinburgh may accordingly have suggested the notion of a circulating library. Be this as it may, the library which he began was continued through various hands for above a hundred years. At Ramsay's death in 1758, his library was sold to a Mr. Yair, whose widow carried it on till 1780, when it was bought by Mr. James Sibbald, an ingenious inquirer into Scottish literary antiquities. Sibbald lived some years as a literary man in London, during which period, beginning with 1793, the C. L. was carried on, subject to an agreement, by a Mr. Laurie. Sibbald afterwards resumed the direction of the library, which he considerably extended. At his death in 1803, his brother attempted to carry it on; but not being successful in his management, he disposed of it in 1806 to Alexander Mackay, a person of extraordinary energy and perseverance. By the acquisition of various other libraries, Mr. Mackay greatly enlarged the collection, which, under the name of the Edinburgh C. L., he conducted at 154 High Street. Here, by long continued and minute attention to business, Mr. Mackay realized a competency, and he retired from active pursuits in 1831, when this extensive collection of books was broken up and sold by auction.

There are several circulating libraries in London, claiming to be of old date, but probably not so early as 1725. In a late reprint of an old advertisement, we see 'Proposals for erecting a Public Circulating Library in London,' under date June 12, 1742. This library was to be established 'in some convenient place at or near the Royal Exchange;' and the subscription was to be a guinea per annum. Two of the present circulating libraries are believed to be descended from this primitive stock. So numerous had circulating libraries become in the early years of the present century, that they absorbed whole editions of novels and romances prepared for the purpose by a London publishing establishment, designated the Minerva Press. The issue of cheap books and periodicals about 1832 (see BOOK-TRADE) seriously damaged the C. L. system; for people now bought instead of borrowing materials for light reading. The vast increase to the reading public in recent times, and the continually augmenting number of new and popular works of a respectable class, have been the means of restoring prosperity to circulating libraries, more especially in London, where some of them are on a surprisingly gigantic scale. To one library alone, as many as 100,000 new books are said to be added annually, and of kinds very different from those of the old Minerva Press school. The method of reading from these libraries consists in paying a sum per annum—usually a subscription of a guinea—for which a number of new books may at all times be procured, and kept for a specified period. When the books are no longer in demand, they are sold at reduced prices.

The method of circulating books among the members of private associations, is noticed under the head BOOK-CLUB; and that of circulating books in rural districts by means of libraries which are shifted from place to place, will be found in the article ITINERATING LIBRARIES.

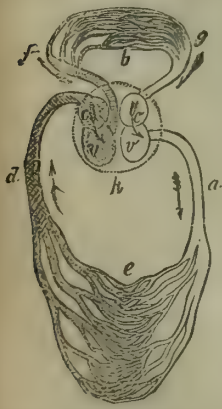


Fig. 1.—Mode of Circulation in Man and other Mammals, and in Birds.

h, heart; *v*, right ventricle; *v'*, left ventricle; *c*, right auricle; *c'*, left auricle; *a*, aorta; *d*, vena cava; *e*, greater circulation; *b*, smaller circulation: *f*, pulmonary artery; *g*, pulmonary veins.

CIRCULA'TION, in Anatomy and Physiology, is the term used to designate the course of the blood from the heart to the most minute blood-vessels (the Capillaries, q. v.), and from these back to the heart.

To simplify the consideration of the subject, we shall consider—1. The Anatomy of the Organs of Circulation—and, 2. The Physiology of the Circulation.

1. The organs of C. consist of the heart, arteries, veins, and capillaries. The course of the blood through these organs will be best elucidated by the aid of a diagram, which is equally applicable for all other mammals as well as for man, and for birds. The shaded part of fig. 1 represents structures filled with impure or venous blood, while the unshaded portion represents structures in which pure, oxygenated, arterial blood occurs. In this diagam we observe a dotted circle, representing a closed bag or sac, termed the pericardium, and enclosing the four cavities *c*, *v*, *c'*, *v'*, of which the heart is composed. Two of these cavities, *c* and *c'*, are for the purpose of receiving the blood as it flows into the heart, and are termed the *auricles;* while the two cavities *v* and *v'* are for the purpose of propelling the blood through the lungs and general system respectively, and are termed the *ventricles*. The vessels that transport blood into the auricles are termed *veins*, and the vessels through which the blood is driven onwards from the ventricles are known as *arteries* (q. v.).

The diagram further shows that what we commonly term the heart, is in reality *two distinct hearts* in apposition with each other—one, shaded in the figure, which is called the right, or venous, or pulmonary heart; and the other, unshaded, which is called the left, or arterial, or systemic heart—the last name having been given to it, because the blood is sent from it to the general system; just as the right heart is termed pulmonary from its sending blood to the lungs. We will now trace the course of the blood as indicated by the arrows in this diagram, commencing with the right auricle, *c*. The right auricle contracting upon the venous or impure blood with which we suppose it to be filled, drives its contents onwards into the right ventricle *v*, through an opening between these two cavities, called the right auriculo-ventricular opening, which is guarded by a valve, named the tricuspid—from its being composed of three pointed membranous expansions—which almost entirely prevents the regurgitation or reflux of the blood from the ventricle into the auricle. The ventricle *v* being now filled, contracts, and as the blood cannot return into the auricle, it is driven along the shaded vessel, the driving branches of which are indicated by *f*. This vessel is known as the pulmonary artery, and conveys the blood to the lungs. At its commencement, it is guarded by valves, termed, from their shape, the semilunar pulmonary valves, which entirely prevent the blood which has once been propelled into the pulmonary artery from re-entering the ventricle. The pulmonary artery gradually divides into smaller and smaller branches, which ultimately merge into capillaries. In these capillaries, which are freely distributed over the interior of all the air-cells (of which the lung is mainly composed), the venous blood is brought in contact with atmospheric air, gives off its carbonic acid gas (which is its principal impurity), and absorbs oxygen, by which processes it is converted into pure or arterial blood. The capillaries, *b*, in which the blood is arterialized, gradually unite to form minute veins, which, again, join to form larger vessels, until finally the blood is collected into a small number of vessels known as pulmonary veins, which pour their contents into the left auricle. Only one such vessel, *g*, is shown in the figure, because the main object of this diagramatic scheme is to illustrate the mode and general direction in which the blood circulates, not to indicate the special vessels through which it flows in different parts of the body. The actual number of the pulmonary veins is four—viz., two from each lung. The blood, now fitted for the various purposes of nutrition, enters the left auricle, *c'*, which by its contraction propels it into the left ventricle, *v'*, through the left auriculo-ventricular opening. This opening, like the corresponding one in the right heart, is guarded by a valve which, from its form, is termed the mitral valve, and which entirely prevents the reflux of the blood.

The left ventricle, *v'*, contracts and drives its contents into the large artery, *a*, which represents the aorta—the great trunk which, by means of its various branches (none of which are indicated in the diagram), supplies every portion of the body, from the crown of the head to the soles of the feet, with pure arterial blood. From the aorta and its various subdividing branches, the blood passes into the capillaries, *e*, which occur in every part of the system; in these capillaries it undergoes important changes, which may be considered as almost exactly the reverse of those which occur in the pulmonary capillaries: it parts with its oxygen, becomes charged with carbonic acid, and, as it leaves the capillaries, and enters the minute veins formed by their union, presents all the characters of venous blood. The veins gradually unite till they form two large trunks, termed the superior and inferior *venæ cavæ*, which pour their contents into the right auricle—the point from which we started. Only one of these great veins, *d*, is indicated in the diagram. We thus perceive that there is a complete double C.—that there is a lesser C. effected by the blood in its passage from the right to the left heart through the lungs; and that there is a greater C. effected by that fluid in its passage from the left heart through the system generally to the right heart.

From the above simple ideal scheme, we proceed to the consideration of the more complicated arrangements by which the C. is actually effected in man and the higher animals.

The heart is situated in very nearly the center of the cavity of the chest, or *thorax*, as it is termed in anatomy, between the lungs, behind the breast-bone, or *sternum*, in front of the vertebral column, and above the diaphragm, on which it obliquely rests. Its form is somewhat conical, the lower end tapering almost to a point, and directed rather forwards and to the left. This lower portion alone is movable, and, at each contraction of the heart, it is tilted forwards, and strikes against the walls of the chest between, in man, the fifth and sixth ribs, or a little below the left nipple. All the large vessels connected with the heart—the *venæ cavæ*, the pulmo-

nary artery, and the aorta—arise from its base (see fig. 2), and serve, from their attachment to the neighboring parts, to keep that portion of it fixed. Indeed, these vessels may be regarded as suspending the heart in the cavity, which is lined by a smooth serous membrane, which, near the top, is reflected downwards over the roots of the great vessels, and covers the whole of the outer surface of the heart. These two smooth serous surfaces—one lining the cavity, the other investing the heart—are kept moist by a fluid which they secrete, and by this arangement, friction may be regarded as reduced to its minimum. The cavity or sac in which the heart lies is called the pericardium. Like all serous membranes, it is a closed sac, and, as it may not be easy for the non-professional reader to understand the relative position of the heart, which is at the same time surrounded by and external to this membrane, we may observe that the head in an old-fashioned double night-cap—which is a closed bag—is in much the same position as the heart in the pericardium; it is inside the night-cap, but not in the cavity which intervenes between its two layers.

The substanee of the heart is essentially muscular. The fibres run in different directions, longitudinally and transversely, but most of them obliquely; many over the apex from one side of the

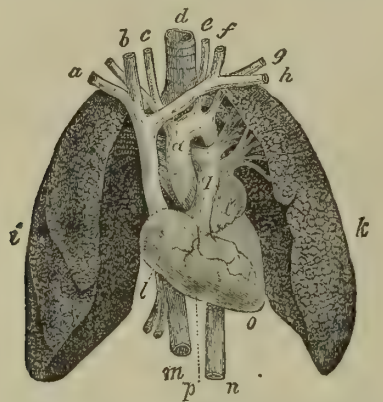

Fig. 2.—The Lungs, Heart and principal Blood-vessels in Man.

a, *h*, veins from the right and left arms; *b*, *f*, right and left jugular veins, returning the blood from the head and neck—these four veins unite to form a single trunk, the *vena cava superior*, which enters the right auricle, *l*; *c*, *e*, the right and left carotid arteries, the latter rising directly from the arch of the aorta, *a'*, the former from a short trunk called the *arteria innominata*; *g*, the left subclavian artery, rising directly from the aorta, while the right subclavian springs from the *arteria innominata*; *d*, the trachea or windpipe; *i*, *k*, the right and left lungs; *l*, *l'*, the right and left auricles; *p*, the right ventricle; *o*, the apex of left ventricle; *m*, the inferior or ascending *vena cava*; *n*, the descending aorta, emerging from behind the heart; *q*, the pulmonary artery.

heart to the other; and all are so involved as to render it very difficult to unravel them. In consequence of this arrangement, the fibres, by their contraction, seem simultaneously to diminish each cavity in all directions, and thus serve most efficiently to drive the blood onwards. The size of the heart has been estimated as about that of the closed fist of the same individual. Its weight, as compared with that of the body was determined by Dr. Clendinning to be 1 : 160 in the male, and 1 : 150 in the female. The same physician carefully examined nearly four hundred hearts of persons of both sexes, and determined the average weight at about 9 oz. avoirdupois, while Dr. John Reid found the average weight of the male heart to be a little more than 11 oz., and that of the female heart to be a little above 9 oz.

In our ideal sketch of the organs of C. (fig. 1), we have indicated the different cavities into which the heart is divided. In fig. 3 there is represented a section of the human heart, which is sufficiently like the reality to give the reader a fair idea of the position of its various parts. The two theoretical hearts, which were nearly in contact in fig. 1, are here fused into a single organ, but the division of the two sides is still as complete, in so far as the functions of the heart are concerned, as in the ideal scheme.

We see a strong vertical partition separating the entire heart into two halves, which are very similar to each other. In the accompanying figure (fig. 4), we have a representation of all these valves—the auricles having been removed so as to give a distinct view of the upper surface of the ventricles. The tricuspid and mitral valves, which are entirely closed—the two ventricles contracting simultaneously—are represented by 1 and 3 respectively; while the pulmonary and aortic semilunar valves, which, when closed, always present a concave surface towards the lungs, are indicated by 4 and 5. The walls of the ventricles are much thicker than those of the auricles, and those of the left ventricle are about four times as thick as those of the right; the amount of muscular tissue being, in all these cases, proportional to the work to be done. All details regarding the anatomy of the heart, except such as bear directly upon the C., would be out of place in this article, and we shall, therefore, omit all notice of many structures which present themselves on opening its various cavities. We will merely add, that the heart receives the arterial

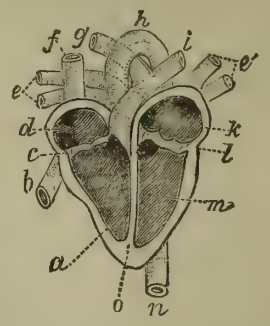

Fig. 3.—Theoretical Section of the human Heart:

f, *b*, the two *venæ cavæ*, opening into *d*, the right auricle; *c*, the tricuspid valve; *a*, the right ventricle, from which proceeds the pulmonary artery, dividing into branches *g* and *i*, going to the right and left lung respectively; *e*, *é*, the pulmonary veins (two from either lung), entering into the left auricle, *k*; *l*, the mitral valve; *m*, the left ventricle, from which proceeds the aorta, whose arch is identicated by *h*, the descending portion by *n*, none of its branches being indicated in this figure; *o*, the partition, or *septum*, between the right and left hearts.

blood necessary for its own nutrition from the coronary arteries, two trunks which are given off by the aorta immediately above the semilunar valves; and that this blood having discharged its function, is carried back to the right auricle by the coronary veins; this blood obviously having the shortest possible systemic circulation.

Since all the arterial blood leaves the heart through the aortic opening, in tracing its course to the different parts of the system we obviously have only to follow the aorta to its final branches. Referring to the article AORTA, where the principal branches of that great organ are indicated, it is sufficient, without further anatomical details, to say that the final ramifications of the arteries distribute the arterial blood to the Capillaries (q. v.), which pervade every part of the body.

The *veins* like the arteries, are found in nearly every tissue; they commence by minute plexuses (an anatomical term for a network-like arrangement), which communicate with the capillaries. Branches from these plexuses uniting together, form small venous trunks, which, by joining, increase in size as they pass onward towards the heart. If we except certain venous structures (called *sinuses*) occurring in the interior of the skull, we may divide the veins into two sets—the *superficial* or *cutaneous*, and the *deep* veins.

The deep veins accompany the arteries and are usually enclosed in the same sheath of cellular tissue with them. In the case of

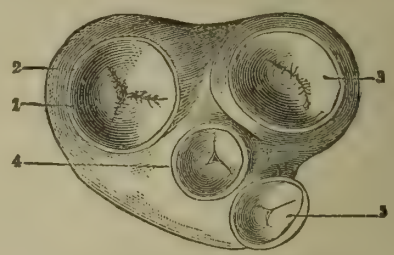

Fig. 4.—Valves of the Heart and Arteries.

Upper surface of the Heart, the Auricles having been removed. In this figure the heart is turned in such a position that the anterior surface lies lowermost; hence the apparent discrepancy of the *right* auriculo-ventricular orifice lying on the *left* side of the diagram.

1. Right auriculo-ventricular orifice, obliterated by the tricuspid valve; 2. fibrous ring surrounding this orifice; 3 left auriculo-ventricular orifice, surrounded by a ring, and closed by the mitral valve; 4. orifice leading into the aorta from the left ventricle, closed by the semilunar valves; 5. orifice leading into the pulmonary artery from the right ventricle, also provided with three semilunar valves.

the smaller arteries, they generally exist in pairs, one on each side the artery, and are called *venæ comites*, while the larger arteries have usually only one accompanying vein.

The superficial veins occur immediately beneath the integument; they not only return the blood from the skin and adjacent structures, but communicate with the deep veins.

All the veins finally unite into two large trunks, termed the *superior* and *inferior vena cava*, which open into the right auricle of the heart; the superior vena cava being formed by the union

of the veins which return the blood from the head and neck (the jugulars) with those which convey it from the arms (the subclavians), as shown in fig. 2; while the Inferior vena cava (also shown in the same figure) receives the blood from the lower extremities, the trunk, and the abdominal and pelvic viscera.

We must refer to the article VEIN for the structure of the walls of this part of the circulating system. There is only one point that imperatively requires notice here—viz., that while the arterial system presents no valves, except at the points where the two great trunks leave the heart, the veins contain a great number of valves, which are formed by a doubling of their lining membrane, and resemble pocket-like folds or pouches, which allow the blood free passage towards the heart, but prevent its reflux.

There is one part of the venous C. which, from its great importance, requires special notice—viz., that of the venous blood of the spleen, pancreas, stomach, and intestinal canal. The blood supplied to these organs by the cœliac axis and the two mesenteric arteries is not returned directly to the vena cava, and thence to the heart, as occurs in other parts of the system. The veins of these organs unite together into one large vessel, called the *vena portæ*, which, entering the liver, branches out again like an artery, and finally subdivides into a capillary network that permeates the whole of its mass. It is from the venous blood, as it traverses these capillaries, that the bile is secreted. This portal blood, together with the blood of the hepatic artery, after it has become venous, is finally carried off by the hepatic veins (usually three in number), which open into the inferior vena cava.* Thus the blood which flows through the portal vein passes through two sets of capillaries, between the period of its leaving the aorta and entering the vena cava.

Our knowledge of the true course of the C.—viz., that the blood propelled from the left side of the heart, after traversing the arteries, returned by the veins to the right side of the heart; and the blood of the right side, passing through the pulmonary artery, traversed the lungs, and returned by the pulmonary veins to the left auricle—is of comparatively recent date. Harvey's celebrated work, *Exercitatio de Motu Cordis et Sanguinis*, was not published till 1628, although there is good reason to believe that it was written nine or ten years previously. Before the appearance of this celebrated work, which marks an epoch in physiological science, the views that were held on this subject were so vague that it is unnecessary for us to enter into any notice of them. (The reader who takes an interest in this point is referred to Dr. Willis's *Life of Harvey*, prefixed to his translation of Harvey's Works, for the Sydenham Society.) In one point, Harvey's proof of the course taken by the blood was defective; the microscope had not then revealed the existence of the capillaries, and he was consequently altogether at fault as to the mode by which the blood passed from the arteries to the veins. By a strange coincidence, Malpighi, who discovered the corpuscles by which the motion of the blood in the capillaries can be traced, was born in the course of the very year (1628) in which Harvey's work was published.

The double C. which we have described, is the course performed by the blood from the time of birth during the whole period of life. The C. of the blood, however, begins before birth—indeed, at a very early period of intra-uterine or fœtal existence; and the circumstance that before birth the lungs do not act as organs of respiration, induces a very important modification in the course of the blood in fœtal life, which will be described under FŒTUS.

We now leave for the present the C. in man, and proceed to notice some of the leading peculiarities of the C. in other animals. In the warm-blooded animals—mammals and birds—the course of the blood is *essentially* the same as in man, for in all these animals the heart, like the adult human heart, possesses four distinct cavities. In form, however, it presents certain peculiarities in some of the mammalia. It is generally more rounded and less elongated than in man. In the cetacea, it is very broad and flat; and in at least one genus, the dugong, the right and left ventricles are separated by a deep fissure. In some herbivorous mammals, as in the ox, sheep, goat, &c., a cruciform ossification, called the bone of the heart, is found in the septum between the ventricles. In the ornithorhynchus, or duck-billed platypus, the heart, in some respects resembles that of birds. We likewise find certain varieties in the distribution of the blood-vessels. Thus, while in man the subclavian and carotid arteries arise on the right side from a short common trunk given off by the aorta, and on the left side arise directly from the aorta, we find several varieties of this arrangement in the mammalia.

In the horse and the ruminants, the aorta divides at once at its origin into an anterior trunk, which gives off the carotid and subclavian arteries of both sides, and a posterior trunk for the thoracic and abdominal aorta. In the dolphin, and in some—if not all—of the bats, two short trunks (*arteriæ innominatæ*) arise, and give off each a carotid and subclavian on either side. In the elephant, both carotids are given off from a single common trunk, situated midway between the two subclavians. All these, and other varieties which might be noticed, are occasionally found in man; and it may be laid down as a general rule, that when any abnormal arterial distribution is detected in the human subject, it represents the normal type in some lower mammal.

A very remarkable peculiarity in the distribution of the vascular system (both arteries and veins) is exhibited by the cetacea and other diving animals, in which the respiration, and consequently the arterialization of the blood, is temporarily stopped. Various

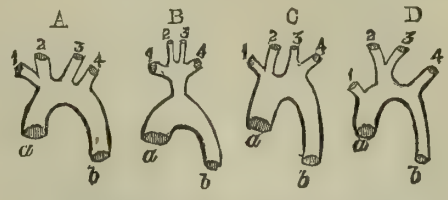

Fig. 5.—Diagram of certain varieties in the Origin of the Main Trunks from the Arch of the Aorta:

A, Man; B, the Ruminants; C, Dolphin and Bats; D, the Elephant. 1, the right subclavian; 2, right carotid; 3, left carotid; 4, left subclavian; *a*, ascending aorta; *b*, descending aorta.

arteries of the trunk here assume a ramified and convoluted form, so as to constitute reservoirs capable of holding a large quantity of pure blood; while the venous trunks exhibit similar dilatations, capable of receiving and retaining for a considerable time the impure blood which has circulated through the system, and of preventing the right heart from being overcharged with venous blood during the temporary suspension of respiration. By means of these arterial reservoirs, the cetacea can support life under water for a quarter of an hour, or even longer.

Another peculiarity deserving of notice is, that occasionally a large artery will divide into a great number of smaller vessels, which again reunite to form a single trunk. An arrangement of this kind is known as a *rete mirabile*, and a good example of it occurs within the scull in long-necked grazing animals, the object being to check too strong a current of blood to the brain.

In birds, the heart is usually of a very large size, as compared with the bulk of the body. The trunk of the aorta is extremely short, and divides into three main branches, the central one forming the descending aorta, while the two lateral ones give off the carotid and subclavian arteries on either side. The branches of the latter give an abundant supply of blood to the powerful thoracic muscles by which the wings are moved.

In the class of reptiles, there is not a complete double C., a mixture of arterial and venous blood being sent both to the lungs and to the general system. In fig. 6, the general nature of the C. in this class is typically represented. The heart consists of two auricles and one ventricle. The impure blood which has circulated through the system is conveyed by the vena cava into the right auricle, from whence it passes into the common ventricle. At the same time, blood which has been aërated in the lungs is poured into it from the left auricle; hence the ventricle contains an admixture of venous and arterial blood. As both a pulmonary artery and an aorta are given off by the ventricle, the latter by its contractions simultaneously drives one portion of its contents to the lungs, and another to the general system. In this way, a semi-oxygenated blood is transmitted to the various parts of the body, the only pure blood being that which is contained in the left auricle, and in the veins opening into it.

Although the above may be regarded as the *general* type of the circulating apparatus in reptiles, yet there are many modifications of it (into which we have not space to enter), which connect it on the one hand (in the case of the *Perennibranchiate amphibia*, such as the axolotl, proteus, &c.) with that of fishes, and on the other hand (when there is a more or less perfect separation of the ventricular cavity, as in the crocodiles) with that of birds and mammals.

In the class of fishes, the circulating apparatus is far simpler than in reptiles. The heart possesses only two cavities, an auricle and a ventricle, and is traversed solely by venous blood; hence it is analogous to the right side of the mammalian heart. Venous blood is brought by veins, which correspond with our *venæ cavæ*, from all parts of the system, and enters the auricle (see fig. 7); from the auricle, the blood passes into the ventricle, which is of great muscular strength; and the ventricle propels its contents through a vessel which corresponds with our pulmonary artery, and which dividing on either side into four or five branches, goes to the gills, in the capillaries of which it becomes oxygenated, by means of the air that is diffused through the water. From the filaments and fringe-like structures of the gills, it is at length collected into a large trunk, commonly called the dorsal vessel, but analogous to the aorta of mammals and birds, in so much as it

* In fishes, not only the blood of the intestines, but that of the posterior part of the body, enters this portal system, which is distributed in this class of animals both to the kidneys and to the liver.

supplies the whole body with arterialized blood. After passing through the systemic capillaries, the blood returns in a venous condition to the heart, and the above process is repeated.

Although the heart is simpler then in reptiles, the C. is in one sense of a higher character, in so far as pure arterial (not mixed) blood

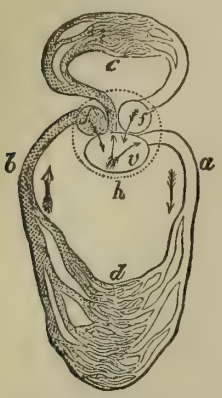

Fig. 6.—Circulation in Reptiles:

h, heart, enclosed in pericardium; *f*, *f*, right and left auricles; *v*, single ventricle; *a*, aorta; *b*, vena cava; *c*, smallar circuluation; *d*, greater circulation.

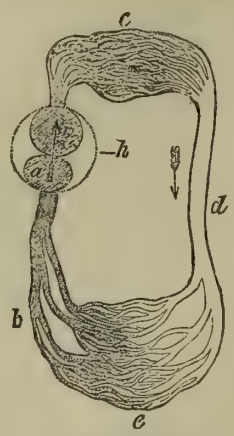

Fig. 7.—Circulation in Fishes:

h, heart, enclosed in pericardium; *a*, the auricle; *v*, the ventricle; *c*, the capillary circulation in the gills; *d*, the dorsal artery; *e*, the systemic capillaries; *b*, the veins.

is here conveyed to all parts of the system; hence, probably, the far greater muscular energy of fishes may be explained.

We can only allude very briefly to the C. in the invertebrate animals.

In the mollusca, we find hearts of varying complexity,* usually with one or two auricles, and one ventricle; but in all cases, the auricle or auricles receive aëriated blood from the respiratory organs, and pass it to the strongly muscular ventricle, which propels it over the body. The heart is therefore a *systemic* heart. There seem to be no capillaries in these animals, excepting in the respiratory organs; the blood leaving the open ends of the arteries, passes into the interstices (*lacunæ*) of the parenchyma of the body, from whence it is taken up by the open mouths of the venus radicles; hence this kind of C. is called lacunary.

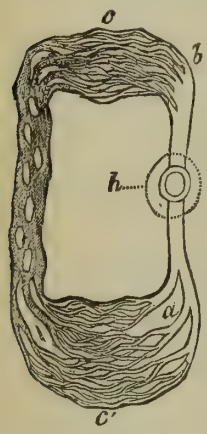

Fig. 8.—Circulation in the Crustaceans:

h, the heart and pericardium; *a*, the arteries; *c'*, the systemic capillaries; *c*, the branchial or respiratory capillaries; *b*, the branchio-cardiac vessels.

In the crustacea, the form of the heart and the number of its orifices presents several modifications; the following is, however, the *typical* mode of C. of these animals. The heart, which is here a single cavity, is sometimes round, and sometimes long and tubular, and is the point of departure of the arterial system, which consists of trunks emerging in various directions. The blood returning from the arteries does not enter into distinct veins, but into irregular excavations in the tissues which are termed venous sinuses; from these venous sinuses it passes to the gills, from whence it is returned to the heart in an aërated state by the branchio-cardiac canals; so that here, as in the mollusca, the heart is systemic.

It is unnecessary for us to notice the comparatively imperfect C. in insects and animals lower in the scale than those we have already considered.

We now approach the last part of the subject—the physiology of the circulation.

We shall consider—1. The flow of blood through the heart; 2. The phenomena of the arterial C.; 3. The phenomena of the capillary C.; and 4. The phenomena of the venous circulation.

1. Direct observation and experiment clearly show, that the muscular contraction of the heart is the principal source of the power by which the blood is propelled in its course. This action of the heart may be observed by opening the chest of a living animal, or, better still, of an animal deprived of sensation and motion by poison, and in which artificial respiration is kept up. It is then seen to consist of two motions—first, a contraction or systole of the auricles, and second, a corresponding contraction of the ventricles. The contraction of the auricle immediately precedes that of the ventricle, and the systole of each cavity is directly followed by its diastole or relaxation; there is then a brief period of repose, the heart exhibiting little or no motion. At the moment of the systole of the ventricles, the apex of the heart is tilted forwards, causing a pulsation against the ribs that can be felt externally.

The force exerted by the left ventricle has been so very variously estimated, that we must regard this point as still unsettled. The number of contractions of the heart of an adult in a minute is about 70 or 75; it is, however, liable to great variations, which will be noticed in the article PULSE. The sounds accompanying the heart's action, which may be readily heard by applying the ear either directly or through the medium of the stethoscope to the cardiac region, are discussed in the article HEART, SOUNDS OF THE.

2. The arteries exercise a vast influence on the movement of the blood through them, in virtue of two properties which they possess—viz., elasticity and contractility. These two endowments are not equally and uniformly possessed by the whole arterial system—elasticity (the property by which the interrupted or discontinuous force of the heart is made equable and continuous) existing chiefly in the larger trunks; while contractility—which is more required for regulating the flow of blood to particular parts—is most marked in the smaller vessels. The rate of movement of the blood through the arteries in man can only be roughly calculated from experiments on animals. Volkmann finds that in the carotids of mammals, the average velocity of the blood-stream is about 12 inches per second; he likewise ascertained that the velocity is greater in arteries lying near than in those at a distance from the heart, that it is not increased by an augmentation in the number of pulsations, but that it is greatly augmented by an increase in the volume of the blood, and lessened by its diminution.

3. It has long been a debated point, whether the capillary C. is influenced by any other agency than the contractility of the heart and arteries. Harvey believed that the action of the heart alone was sufficient to send the blood through the whole circuit, and in recent times his view has been supported by J. Müller and other eminent physiologists. On the other hand Professor Draper of New York holds the opposite extreme view, asserting that 'it is now on all hands conceded that the heart discharges a very subsidiary duty.' We believe that Bichat was the first to maintain the opinion, that the capillaries are organs of propulsion, and are alone concerned in returning the blood to the heart through the veins. Although Bichat attributed too great power to the capillaries, there cannot be a doubt that the movement of the blood through these vessels is not solely due to the heart; in short, that there is what may be termed a capillary power. The following are a few of the facts proving this to be the case: 1. On watching the C. in the web of a frog's foot, it is at first seen to go on with perfect regularity. After a time, however, various changes are observed, which cannot be attributed to the heart, such as alterations in the size of some capillaries, and in the velocities of the currents passing through them, and occasionally even a reversal in the direction of some of the lesser currents. 2. In cold-blooded animals, the movement of the blood in the capillaries continues long after the excision of the heart. 3. Actual processes of secretion not unfrequently continue after death; sweat, for instance, may be exuded from the skin, and other secretions may be formed by their respective glands, which could not take place if the capillary C. had stopped. 4. Cases occasionally occur in which a fœtus without a heart is produced, and yet in these cases most of the organs are well developed.

What the nature of this capillary power is, is not clearly known. Professor Draper and others have endeavored to explain it on the principles of capillary attraction. There is no satisfactory evidence that the capillaries possess true contractility, for, although their diameter is subject to great variations, this may be due simply to the elasticity of their walls. If we could only establish their contractility, the difficulty would be removed.

The rate of movement of the blood through the capillaries is about 1·2 inch per minute in the systematic capillaries of the frog. In the warm-blooded animals it is probably more rapid. From Volkmann's observations, the rate in the dog is about 1·8 inch per minute.

4. It is usually estimated that the venous system contains from two to three times as much blood as the arterial. The latter is probably the more correct ratio, and, as the rapidity of blood in the two systems seems to bear an inverse ratio to their respective capacities, the venous blood will move with only one-third of the velocity of arterial blood. We have already noticed the occurrence of valves in the venous circulation.

Their object is evidently to prevent the reflux of blood; hence they are of important use in the maintenance of this part of the circulation. They are most abundant where there is much muscular movement. The movement of blood through the veins is

* In some of the ascidians and in salpa, the following remarkable phenomenon occurs: The heart, which is extremely simple, and of course without valves, at definite intervals (of about twenty minutes) reverses the direction of its current. Before the heart changes the direction of its contractions, it remains still for a short time, and the blood-currents in the body are thus slackened in their course before they receive an impulse in the opposite direction. The vessels entering and leaving the heart thus act alternately as an aorta and as a vena cava.

undoubtedly mainly due to the *vis a tergo* resulting from the contraction of the heart and arteries. This is much assisted in many parts of the system by the constantly recurring pressure of the adjacent muscles upon their trunks. The movement of inspiration, by causing a comparative vacuum in the chest, has been supposed by some physiologists to assist the flow of venous blood to the heart, and a similar influence has been ascribed to an assumed suction power of the heart. The contractility of the veins in man is to slight too produce any marked effect on the propulsion of the current. From the investigations of Professor Wharton Jones 'on the rythmical contractility of the veins of the bat's wing,' we may infer that, in many of the lower animals, it is probably more efficient power.. In connection with this article, consult ARTERY, CAPILLARIES, PULSE, and VEIN.

CIRCULA'TION OF SAP in plants—its ascent from the root to the leaves and bark, and its partial descent after the elaboration which it undergoes in these organs. The sap drawn from the ground by the roots (see OSMOSE) ascends in exogenous plants, which have hitherto been principally the subjects of examination, through the more recent parts of the woody tissue, and especially through the alburnum. The descent of the sap takes place chiefly through the liber or inner bark. It appears certain also that, on its return to the root, only a small portion is excreted, and that the greater part ascends again, readapted to the use of the plant by the excretion which has taken place. Much of the sap which is taken up by the roots is, however, thrown off in perspiration by the bark and leaves. The sap is laterally diffused through the cellular tissue of plants, and very interesting observations have been made by Schultz and others on the peculiar movements of the elaborated or descending sap (*latex*). Many physiologists dislike the term *circulation* applied to sap, as suggesting a closer analogy than really exists to the circulation of the blood in animals. See PLANT, LEAVES, and SAP.

CIRCUMCI'SION (Lat. a cutting around), the cutting off the foreskin (*præputium*), a rite widely diffused among ancient and modern nations. The prevalent idea among Christians was (and perhaps still is), that the rite originated with Abraham, who (as we read in Gen. xvii. 9—14) was commanded by God to circumcise himself and his whole household, and to transmit the custom to his descendants. But, as Jahn (*Biblische Archäologie*, Vienna, 1797—1800) acutely observes, this is inconsistent with the very terms in which the command is expressed, these terms pre-supposing a knowledge of the rite on the part of Abraham. That it existed previously to the time of the patriarch, however, seems to be indisputable. The researches of modern scholars prove that the Egyptians, for instance, were in the habit of circumcising long before Abraham was born. Rawlinson, in a note to his version of Herodotus, remarks that 'circumcision was already common in Egypt at least as early as the fourth dynasty of kings, and probably earlier, long before the birth of Abraham, or 1996 B.C.' The testimony borne by the monuments of Upper and Lower Egypt (consult Sir Gardiner Wilkinson's *Manners and Customs of the Ancient Egyptians*) is to the same effect, and apparently conclusive. Another argument which has been adduced against its Abrahamic origin, is the fact of its being so extensively practised. At the present day, it may be traced almost in an unbroken line from China to the Cape of Good Hope. It is also a usage in many of the South Sea Islands, and the followers of Columbus were much astonished to find it existing in the West Indies, and in Mexico. Recently, too, it has been ascertained to have been long practised by several tribes in South America. Such being the case, many scholars hold it impossible to suppose that the origin of so universal a rite can be traced to a single Semitic nation, more especially when that nation was peculiarly averse to intercourse with other nations, and in other respects exercised no overt influence on their customs. Whether, as Jahn supposes, Abraham obtained his knowledge of C. from the Egyptians, we cannot determine. It would appear, however, that the Canaanites among whom he came to reside were not circumcised, for we read of the Prince of Shechem and his people undergoing the operation, that the former might obtain the hand of Dinah, daughter of Jacob; and the institution of it in the family of Abraham was probably sufficient to mark off that family from the surrounding tribes. In the case of Abraham and his descendants, the rite acquired a religious significance. It was ordained to be the token or seal of the everlasting covenant between God and his people. Such is the view of St. Paul, who looked upon the C. of the foreskin as symbolical of the C. of the heart; and that along with all that was merely Judaistic and material, it was abrogated by the more spiritual teaching of Christ.

The time for C. among the Jews is the 8th day after the birth of the child; among the Arabians, the 13th year, in remembrance, it is said, of their ancestor Ishmael; among the Kaffirs, at a still later period, marking, in fact, the transition from youth to manhood; and, indeed, each nation seems to have selected the time most agreeable to its own notions of what is prudent or becoming. The Abyssinians are the only people professing Christianity among whom C. is practised. The C. of females, or what is equivalent to such, is not known among the various African nations. For fuller information in regard to C., consult Sonnini's *Travels in Egypt*, Sir John Marsham's *Chronicus Canon Ægyptiacus*, and Winer's *Biblisches Realwörterbuch*.

CIRCU'MFERENCE, or PERI'PHERY, the curve which encloses a plane figure: thus, we speak of the circumference of a circle, or of an ellipse; but in figures bounded by straight lines, as the triangle, square, and polygon, the term *perimeter* is employed to designate the whole bounding lines taken together.

CIRCUMNAVIGA'TION, the term usually applied to the act of sailing round the world, its literal meaning being simply a sailing round. The C. of the globe was at one time considered a great feat, but it is now regarded as one of the most commonplace affairs in a sailor's experience. The first to circumnavigate the globe was Magalhaens (q. v.), or Magellan, a Portuguese, in 1519; eighteen years afterwards, it was accomplished by a Spaniard; and in 1577 by the illustrious Englishman, Drake. The most celebrated of circumnavigators, however, was Captain James Cook, who between 1768 and 1779, made three voyages round the world.

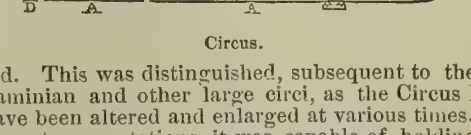
CIRCUMSTA'NTIAL E'VIDENCE. See EVIDENCE.

CIRCUMVALLA'TION, in Fortification, is a series of works surrounding a place when under siege; not to serve offensively against the place, but to defend the siege-army from an attack from without. It usually consists of a chain of redoubts, either isolated or connected by a line of parapet. Such lines were much used in the sieges of the ancient and middle ages; but in modern times they are not so necessary, because the use of artillery lessens the duration of a siege, and also because the besiegers have generally a corps of observation in the open field, ready to repel any force of the enemy about to succor the besieged. A remarkable example of C. was that at Sebastopol, where, while a circuit of batteries fired upon the town, an outer circuit of redoubts and lines kept off the Russians who were in the open field; but the necessity for this arose out of the smallness of the besieging force compared with that of the besieged. The narrow escape of the allies from utter overthrow at Inkerman, showed the necessity for this external defence. For the relation which C. bears to COUNTERVALLATION, see that article.

CIRCUMVE'NTION. See FRAUD.

CI'RCUS. See HARRIER.

CIRCUS, THE, of ancient Rome, was a large oblong building, adapted for chariot-races and horse-races, and used also for the exhibition of athletic exercises, mock-contests, and conflicts of wild beasts. The Circensian Games were alleged by tradition to have originated in the time of Romulus, when they were dedicated to Consus or Neptune, and called *Consualia*. After the first war undertaken by Tarquinius Priscus, in which he captured the Latin city of Apiolæ, his victory was celebrated by games. A space was marked out for a C., and the senators and knights were allowed to erect scaffoldings round it for themselves. The games continued to be held annually, and a permanent edifice was soon afterwards



Circus.

constructed. This was distinguished, subsequent to the erection of the Flaminian and other large circi, as the Circus Maximus. It must have been altered and enlarged at various times. According to different computations, it was capable of holding 150,000, 260,000, or 385,000 persons. Its extent also has been variously estimated. In the time of Julius Cæsar, it was three stadia or 1875 feet long, and one stadium or 625 feet wide, while the depth of the buildings surrounding the open space was half a stadium, or about 312 feet. All the circi in Rome, of which there were a considerable number, are now completely destroyed; but a small C. on the Appian Way, about two miles from Rome, known as the Circus of Caracalla, is still in a state of preservation. Its construction is believed to have differed very little from that of similar buildings. The annexed wood-cut will give some idea of the arrangement and relative dimensions of its parts.

Along the sides and at the curved end (round the lines AA), were ascending ranges of stone seats for the spectators. At the other end, BB, were the *carceres*, or stalls, which were covered and furnished with gates, and in which the horses and chariots remained until, on a given signal, the gates were simultaneously flung open, In the center is the *spina* C, a long and broad wall round which the charioteers drove, terminating at both ends at the *metæ*, or goals—three cones of carved wood which marked the turnings of

the course. At each extremity of the *carceres* is a stone tower, DD. From its gates and castellated appearance, the whole of this side received the name of *oppidum*, a town. Over the *carceres* were seats for the president of the games, the consuls, or other distinguished persons. There were four entrances, of which the most important were the *Porta Pompæ*, F, and the *Porta Triumphalis*, G. The games were inaugurated by a procession from the Capitol, in which those bearing the images of the gods went first, and were followed by the performers in the games, the consuls, and others. This procession entered through the *Porta Pompæ*, while the *Porta Triumphalis* was that by which the victors left the circus.

The *spina*, an object conspicuous from its situation, was in general highly decorated by such objects as statues, small temples, altars, &c. In the *spina* of the Circus Maximus, two very large obelisks were erected by Augustus and Constantius. This C. was also distinguished by six towers, and by a canal or *euripus*, formed by Julius Cæsar, to protect the spectators more effectually during the conflicts of wild beasts.

The C. was especially adapted for races, an amusement of which the Romans were passionately fond. The length of a race was seven circuits round the *spina*, and 25 races were run in each day. The number of chariots was usually four. The charioteers adopted different colors, representing the four seasons. Bets and party-spirit ran high, and the victor received a substantial pecuniary reward at the end of the race. The athletic exercises, such as boxing and wrestling, which sometimes terminated fatally, were probably exhibited in the large open space between the *carceres* and the *spina*. The *Ludus Trojæ* was a mock-conflict between young men on horseback. A regular battle was sometimes represented (*Pugna Equestris et Pedestris*). By the formation of canals and the introduction of vessels, a *Naumachia*, or sea-fight, was occasionally exhibited; but, under the empire, this species of exhibition,as well as the *Venatio*, was gradually transferred to the Amphitheater (q. v.). In providing for the *Venatio*, or hunting of wild beasts, vast sums of money were expended. Animals were procured from every available part of the Roman empire, including Africa and Asia. The exhibition not only afforded an opportunity for the display of private munificence or ostentation, but attained the importance of a political engine, which none who aspired to popularity ventured to overlook. When Pompey opened his new theater, he is said to have given public exhibitions in the C. for five days, during which 500 lions and 20 elephants were destroyed.

In modern times, the C. stands but as the shadow of a name. It is about the same size as the modern theater, and is employed principally for the exhibition of feats of horsemanship and for acrobatic displays.

CI'RENCESTER, or CI'CESTER, a parliamentary borough in Gloucestershire, on the Churn, an upper branch of the Thames, and on the Thames and Severn Canal, 17 miles south-east of Gloucester. It has four chief streets, and the appearance of opulence, though it has but little trade. An agricultural college was founded here in 1846 (see AGRICULTURAL EDUCATION). Pop. (1881) 8431. C. returns a member to parliament. C. was the Roman *Corinium-Ceaster*, at the junction of five Roman roads, and has traces of ancient walls two miles in circuit. Roman relics have been found here, as coins, urns, baths. Canute held a council here in 1020 to expel Ethelwolf. Rupert stormed C. in 1642 and 1643, and it was afterwards given up to Essex.

CIRRHO'PODA, or CIRRI'PEDA (Gr. or Lat. cirrhus-footed), the animals which formed the genus *Lepas* of Linnæus, ranked by him among the multivalve *Testacea*, and by subsequent naturalists very generally regarded as an order of mollusks, until, in consequence of recent discoveries, a place has been assigned them among the *Articulata*, either as a distinct class of that great division of the Animal Kingdom, or as a sub-class of *Crustacea*. Barnacles (q. v.) and *Balani* or Acorn-shells (see BALANUS) are the most familiar examples of C.; but many species are now known, all exhibiting much general similarity to these, all marine, and all in their mature state permanently attached to objects of various kinds, as rocks, sea-weeds, shells, &c. Some are found imbedded in corals, others in the thick skin of whales, some in the flesh of sharks. They are distributed over the whole world; the species however, are not numerous anywhere; those species which adhere to fixed bodies are in general much more limited in their geographic range than those which attach themselves to floating objects or to vertebrate animals. They are generally divided into two orders, *Pedunculated* and *Sessile*, those of the former order being supported on a flexible stalk, which is wanting in the latter. Barnacles are pedunculated C., and *Balani* are sessile.

The resemblance of C. to mollusks consists chiefly in their external appearance. In the more important parts of their organization, however, the C. resemble crustaceans rather than mollusks. The gills, when these exist, occupy the same relative position as in crustaceans; but the aëration of the blood is supposed to be also effected in the *cirrhi*, as the limbs or organs have been generally called, of which there are six pair on each side, and which may be described as long tapering arms, each composed of many joints and *ciliated* or fringed with stiff hairs. The *cirrhi* nearest the mouth are shortest, and all of them together form a sort of net for the capture of minute animals, being incessantly thrown out by the cirrhopod from a lateral opening of its sac, and drawn in again in such a manner as to convey any prey which they may have caught to the mouth. Almost all the C. are hermaphrodite; but in a few genera the sexes are distinct, and these exhibit an anomaly of a very remarkable kind, the males being not only very small in comparison with the females, and more short-lived, but, in their mature state, *parasitic* on the females, or attached to them as they are to other objects; whilst in some the still more remarkable anomaly appears of what have been called *complemental* males, attached in this way to hermaphrodites. The eggs of C. are hatched before being finally set free from the body of the parent.

The young possess the power of locomotion, swimming freely in the water, and are furnished with eyes, which disappear after they have permanently fixed themselves, by instinctive choice, in situations adapted to their kind. They have also shells, quite different from those of their mature state. The shelly coverings of the C. are all formed according to a certain type, but with many variations, and they differ extremely in the number of pieces or valves of which they consist, some, as the common barnacles, having only five valves, and others having additional small pieces arranged in whorls, and exceeding 100 in number. In most of the C., the shelly covering is very complete; in some, it is almost rudimentary.

The most important discoveries concerning the structure and metamorphoses of the C., determining their place in the animal kingdom, were made by Mr. J. V. Thompson. For the most extended examination of species, and for an admirable monograph, published by the Ray Society, the scientific world is indebted to Mr. Darwin.

CI'RRHUS, CI'RRUS (Lat. a curl, or lock of hair), or TE'NDRIL, in Botany, a leaf altered into a slender spiral, which, by twisting around such objects as it comes in contact with, attaches the plant to them, and enables it to climb, when otherwise, through the weakness of its stem, it must have been prostrate. There are many varieties of C., as it is merely an elongation of the midrib of a pinnate leaf—and altered terminal leaflet, or becomes compound by the alteration of several leaflets, or occupies altogether the place of a simple or compound leaf, and is accordingly either simple or branching. Examples of different kinds may be seen in the pea, vetch, vine, passion-flower, &c.—The term C. is also employed in zoology, to designate any curled filament, and has been applied, but not quite aptly, to the curiously modified feet of the *Cirrhopoda*.

CI'RRUS. See CLOUDS.

CIS, a Latin preposition meaning, 'on this side,' which is often prefixed to names of rivers and mountains to form adjectives; Cisalpine, Cispadane, 'on this side of the Alps,' 'of the Po.' As most of these words are of Roman origin, Rome is considered the point of departure.

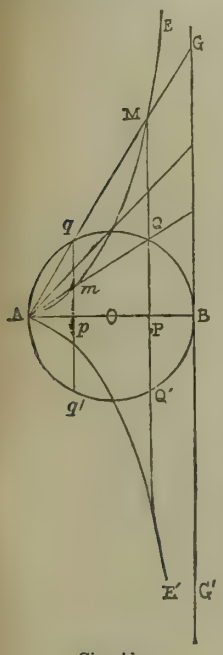
CISA'LPINE REPU'BLIC. After the battle of Lodi, in May 1796, General Bonaparte proceeded to organize two states—one on the south of the Po, the Cispadane Republic, and one on the north, the Transpadane. These two, however, were in 1797 united into one under the title of the C. R., which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the duchy of Modena, the principality of Massa and Carrara, and the three legations of Bologna, Ferrara, and the Romagna. The republic had a territory of more than 16,000 square miles, and a population of 3½ millions. Milan was the seat of the government or Directory, and the place of meeting of the Legislative Assembly, which was composed of a senate of 80 members, and a great council of 160. The army consisted of 20,000 French troops, paid by the republic.

A more intimate connection was formed in 1798 between the new republic and France, by an alliance offensive and defensive, and a treaty of commerce. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte, after the victory of Marengo, with some modifications of constitution and increase of territory. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its president. A deputation from the republic in 1805 conferred on the Emperor Napoleon the title of King of Italy; after which it formed the kingdom of Italy till 1814.

CISSA'MPELOS (Gr. ivy-vine), a genus of plants of the natural order *Nenispermaceæ*, of which some of the species possess valuable medicinal properties; particularly *C. Pareira*, a native of the West Indies and warm parts of America, the root of which is known by the names of *Pareira Brava* and *Butua Root*. The plant is called Velvet Leaf in the West Indies, from the peculiar and beautiful appearance of the leaves. It is a climbing shrub, with roundish-triangular leaves, racemes of small yellow

flowers, and small hairy scarlet berries. The root appears in commerce in pieces of two or three feet long, varying from the thickness of the finger to that of the arm, tough, but so porous that air can be blown from end to end of it. It has a sweetish, afterwards nauseous taste; is used as a tonic and diuretic, appears to exercise a specific influence over the mucous membrane of the urinary passages, and is administered with advantage in chronic inflammation of the bladder. It was formerly supposed to possess great lithontriptic powers, which it was even hoped would put an end to all necessity for lithotomy. It is supposed that the roots of other plants of the same order are often fraudulently mingled with it; but those of several species of C., both American and East Indian, appear to possess pretty nearly the same properties. An alkaloid, called *Cissampelin*, exists in this root, and gives it its properties.

CI'SSOID OF DI'OCLES, a curve first employed by Diocles the mathematician, whose name it bears, for the purpose of solving two celebrated problems in geometry—viz., the trisection of a plane angle, and the construction of two geometrical means between two given straight lines. Let AB (see fig.) be the diameter of any given circle, and PQ, *pq*, any two ordinates at equal distances from the center O. Then, if we draw a straight line through A and either of the points *q*, Q, and produce it till it cuts the other ordinate, produced if necessary, the point of intersection, M, or *m*, will, in its different positions, trace out a curve called a *cissoid*. The circle AB is called the generating circle, and the diameter AB is called the axis of the curve. It is clear from the figure that the C. must consist of two infinite symmetrical branches, AE and AE', having a cusp point at A. The straight line GB tangent at B to the generating circle, is a common asymptote to these branches. Taking A as origin, and AB = a and a line at right angles to it, through A, as axes of co-ordinates, the equation to the C. is $y^2 = \frac{x^3}{(a-x)}$. The curve may be constructed mechanically. The area of the space included between the two branches and their asymptote, is equal to three times the area of the generating circle. If, instead of a circle, we employed any other curve as the generating curve, the curve generated in the same way as the C. of D., is called *cissoidal*. The word cissoid comes from the Greek *cissos*, ivy, and *eidos*, form.



Cissoid.

CI'SSUS. See VITACEÆ.

CISTE'RCIANS, a religious order, taking its name from the parent monastery of Citeaux (Cistercium), near Dijon, which was founded in 1098 by the Benedictine abbot, Robert of Molême. Through the influence chiefly of St. Bernard of Clairvaux, who became a monk of Citeaux in 1113, the order, within little more than a century after its foundation, was in possession of more than 1800 abbeys in France, Germany, England, Ireland, Denmark, Norway, and Sweden. The C. were distinguished from the order of Clugny by their severer rule and stricter poverty, avoiding everything like splendor in their churches, even gold and silver crosses; by being submissive to the jurisdiction of the bishops, at least till after the death of St. Bernard; by not meddling with the cure of souls; by wearing a white robe with a black scapulary; and by their peculiar form of government, which was introduced by Innocent III., in 1215, into all the monastic orders.

In France, the members of this order called themselves Bernardines, in honor of St. Bernard. Among the fraternities emanating from the C., the most remarkable were the Barefooted monks or Feuillans, and the nuns of Port Royal in France, the Recollets or reformed Cistercian nuns in Spain, and the Trappists. The number of Cistercian abbeys in England, in the reign of Henry VIII., was 75, besides 26 Cistercian nunneries. In Scotland, there were 11 abbeys and 7 nunneries. Among the English abbeys were Woburn, Tintern, Furness, Fountains, Kirkstall, and Rievaux; among the Scottish, Melrose, Dundrennan, Kinloss, Glenluce, Culross, Deer, Balmerino, and Sweetheart or New Abbey. The chief French abbeys, *les quatre premières filles de Citeaux*, as they were called, were La Ferté, Pontigny, Clairvaux, and Morimond. Riches and indolence brought this powerful order, as well as others, into decay. Even before the Reformation, many of their convents had ceased to exist. The French Revolution reduced the C. to a few convents in Spain, Poland, Austria, and Saxony.

CI'STERN, a tank for holding water. In places where the supply of water is intermittent, or where rain-water is used, every house requires a C. or water-butt. Cisterns are much used for the supply of steam-engine boilers at railway-stations. They are variously constructed—many of cast or wrought iron, of deal lined with lead or zinc, or of impervious pavement or slate slabs, in which last two cases the sides and bottom are grooved, and cemented together with white-lead putty, or some other cohesive substance to prevent leakage; and the sides, if the dimensions be at all large, are frequently bound together by means of wrought-iron rods; but very large cisterns are generally made cylindrical, so that the pressure acting at all points equally from the center, the strain comes longitudinally on the outside, and tie-rods can be dispensed with, which is an advantage, as the holes for the tie-rods are apt to be a cause of leakage. See WATER SUPPLY.

Helianthemum Vulgare.

CI'STUS (Gr.), or RO'CK-ROSE, a genus of exogenous plants, which gives its name to the natural order *Cistaceæ;* an order allied to *Cruciferæ* and *Capparideæ*, and containing about 200 known species of shrubs and herbaceous plants, chiefly natives of the south of Europe and north of Africa. The flowers have generally five petals, very delicate; the stamens are numerous, the style simple, the fruit a capsule. Many species of this order are more or less resinous; and from the twigs of some species of *Cistus*, natives of the south of Europe and the Levant, particularly *C. Creticus*, *C. Cyprius*, and *C. ladaniferus*, the resinous substance called *Ladanum* is obtained, which is used as a stimulant, chiefly in plasters, but has become obsolete in British medical practice. Many species of *Cistus* are much cultivated for the beauty of their flowers, which are red, white, lilac, yellow, or frequently of two colors, and are common in gardens and green-houses. Most of the larger kinds require in Britain some protection in winter. The only plant of the order which extends to Scotland is *Helianthemum vulgare*, the yellow flowers of which are a frequent ornament of dry hill-slopes.

CI'TADEL (from the Italian *cittadillo*, 'a little city') is a fort of four or five bastions, in or near a town. A C. serves two purposes: it enables the garrison of a town to keep the inhabitants in subjection; and, in case of a siege, it forms a place of retreat for the defenders, and enables them to hold out after the rest of the town has been captured. A C. must fully command the fortifications of the city, and must have a large space round it clear of buildings.

CITA'TION, the act of calling a party into court to answer an action, to give evidence, or to perform some other judicial act. Being derived from the civil law, the term C. is known in England chiefly or exclusively in the ecclesiastical courts. But it is in frequent use in the legal systems both of France and Scotland. In Scotland, a C. is done in the Court of Session by an officer of court, or by a Messenger-at-arms (q. v.), under authority either of a summons passing the Signet (q. v.), or under a warrant by the court. In inferior courts, no summons, complaint, or decree is now validly served by affixing it to the door of the house, except where the defender has left, and his address is unknown; and no witness is necessary to the service except in poinding, sequestrating, or charging. For the Citation Amendment Acts of 1882, see DEBTS (RECOVERY OF).

Where the party, though amendable to the court, is not resident in Scotland, he must be cited edictally, by a copy of the C. being left at the office of the keeper of edictal citations (see EDICTAL CITATION), by whom lists of such citations are printed and published. Formerly, this C. was effected by a proclamation in Edinburgh and at Leith.

In criminal cases the party cannot appear voluntarily in court: he must be cited, and can plead any omission in form, which cannot be obviated even by consent. This form of C. is regulated by 9 Geo. IV. c. 29, commonly called Sir William Rae's Act. A full and correct copy of the libel, or charge against him, must be served on the panel, or accused, with a list of witnesses, and of the assize, or jury. A notice, intimating the day of compearance, must be marked on the copy of the libel, and subscribed by the officer and a witness. This C. must proceed on a warrant issuing from the court before which the accused is to be tried. It may be executed either by a Macer (q. v.), a Messenger-at-arms (q. v.),

or a Sheriff-officer (q. v.) of the county within which the C. is made (11 and 12 Vict. c. 79, s. 6). If the panel can be found personally, the C. must be delivered to him, but if not, it must be left at his dwelling-place with his wife or servants; or if access cannot be obtained, the officer must affix a copy to the principal door of the house (1555, c. 33).

CITATION FOR INTERRUPTING PRESCRIPTION.—Either the positive or negative prescription may be interrupted by citation in an action. See PRESCRIPTION.

CITI'ZEN (Fr. *citoyen*, Lat. *civis*). Aristotle defines a C. to be one to whom belongs the right of taking part both in the deliberative, or legislative, and in the judicial proceeding of the community of which he is a member (*Politics*, iii. 1). A C., therefore, can exist only in a free state. Between a C. and a subject there is this distinction, that whilst the latter merely is governed the former also governs; and thus, though every C. is a subject, many subjects are not citizens. In this, which was also the sense attached to the term by the Romans, when used in its highest meaning—that, viz., of the *civis optimo jure*—it has passed to the modern world, gradually coming to be understood everywhere. In the heroic ages of Greece, the idea of citizenship was but imperfectly understood. The members of the council and assembly were mere advisers of the kings, who, as god-descended, were regarded as monarchs in the strict sense. But something of the C. character even then attached to the immediate followers of the chief, when regarded in opposition to slaves and strangers; and it was from them that the dominant class sprang, which everywhere overthrew the monarchies, and established the small self-governing states—the democracies, or rather aristocracies, of Greece. At first, the rights of citizenship in Athens and other Greek communities were readily attained by those who were not born to them; but at a later period, when the organization of Greek civic life had reached a high degree of perfection, admission to the roll of citizens was procured with great difficulty. In Sparta, indeed, according to Herodotus, so sparing were they of their national privileges, that there were only two instances of their conferring them in their full measure on strangers. The Periœci, or strangers by origin, who shared the Spartan territory, though not on equal terms with the Spartans, were probably, as regarded political rights, pretty much in the same position with the Roman plebeians. In Rome, there were perfect and less perfect citizens, whose respective positions are thus described by Savigny in his *History of the Roman Law in the Middle Ages:* 'In the free republic, there were two classes of Roman citizens—one that had, and another that had not, a share in the sovereign power. That which peculiarly distinguished the higher class, was the right to vote in a tribe, and the capacity of enjoying magistracy.' All the private rights of citizenship (the *jus connubii* and *jus commercii*) belonging to the citizens of the lower class, but the public rights of voting in a tribe, and of enjoying the honors of the magistracy (*suffragium et honors*), were denied them. Under these two classes, again, there were two others—the Latini and the Peregrini,

Roman citizenship was acquired most commonly by birth, but for this it was requisite that both father and mother should be citizens. If a C. married a Latina, or a Peregrina, even believing her to be a C., the children begotten of the marriage followed the status of the mother. But latterly, it was permitted, by a decree of the senate, to the parents to prove their mistake, and thus to raise both the mother and her children to the rank of citizens. In earlier times, the citizenship could be conferred on a stranger only by means of a *lex*—i. e., by a vote of the people assembled either in one or other of the Comitia (q. v.). It was conferred at a single sweep on the whole of the Latini and Socii. In the case of some of the provinces, both in Italy and Gaul, the *Latinitas* was given as a step to the *Civitas*, the former being converted into the latter in the case of any one who had exercised a magistracy in his own state or city.

When the imperial power was established, the public rights which formed the chief characteristic of the full Roman citizenship, became little more than empty names; and the only value which thenceforth attached to it consisted in the private rights which it conferred. Such as it was, the constitution of Caracalla extended it to the whole Roman world, the distinctions between Cives and Peregrini and Latini being preserved only in the case of certain individuals, such as freedmen and their children. Even this distinction was abolished by the legislation of Justinian, the only divisions of persons henceforth being into subjects and slaves. A fuller account of this interesting subject will be found in Smith's *Dictionary of Greek and Roman Antiquities.*

In its modern use, the term C. is applied in Great Britain to a dweller in a town, and this either in the general sense of an inhabitant, or in the narrower and stricter sense of one who enjoys its privileges and franchises. In France, it denotes any one who is born in the country, or naturalized in it; and in America, it is used in the same sense, but so long as slavery was an institution there, slaves were not included in the title. In this latter acceptation, it is equivalent to the term *subject* in England.

CI'TRIC ACID ($C_{12}H_5O_{14}$, or $C_{12}H_5O_{11},3HO$) is a powerful tribasic acid, which crystallizes in large transparent colorless prisms. These crystals are readily soluble in water and alcohol, but are insoluble in ether. The crystals contain two atoms of water of crystallization (not expressed in the above formulæ), which are expelled at a temperature of 212°. Citric acid has a strongly acid taste and reaction and displaces carbonic acid from the carbonates. Its watery solution quickly becomes mouldy on exposure to the air, and the acid is then found to be converted into acetic acid. When heated to about 350°, vapor of acetone and carbonic oxide are given off, and a residue of aconitic acid ($C_{12}H_6O_{12}$), an acid occurring in the leaves and roots of monkshood and other species of Aconite, is left; and when fused with potash, it assimilates the elements of water, and is decomposed into oxalic and acetic acids, as shown in the equation:

$$\overbrace{C_{12}H_5O_{14}}^{\text{Citric Acid.}}+2HO=\overbrace{C_4H_2O_4}^{\text{Oxalic Acid.}}+\overbrace{2C_4H_4O_4}^{\text{Acetic Acid.}}.$$

These reactions illustrate the changes which organic acids naturally undergo in the vegetable kingdom. It is to the presence of citric acid that a great many fruits owe their agreeable acidity. It occurs in a free state either alone or associated with malic and tartaric acids in oranges, lemons, cherries, currants, raspberries, gooseberries, strawberries, whortleberries, &c., and in several tubers and bulbs, as in the potato and onion. It also exists in combination with potash or lime in potatoes, onions, and artichokes.

This acid, which is almost always prepared from lemon or lime juice, is thus obtained. The juice, after undergoing incipient fermentation, is filtered, and neutralized with chalk; and the insoluble citrate of lime thus formed is decomposed with very dilute sulphuric acid. On the removal of the sulphate of lime that is thus formed by filtration, the solution of citric acid must be concentrated till a film begins to form, when the crystals readily separate on cooling. Citric acid has also been prepared from unripe gooseberries, whose juice is allowed to ferment; and after the removal of the alcohol by distillation, the acid is separated in the way already described. 100 lbs. of gooseberries yield 10 lbs. of spirit of spec. grav. 0·928, and 1 lb. of crystallized acid.

Citric acid is used largely in manufactures; calico-printers employ it for discharging the mordant from the cloth in patterns; and it is used in dyeing silk with safflower, and for heightening the tint of cochineal. The raw material from which the acid for these purposes is obtained 'is a black fluid like thin treacle, which comes from Sicily, and is obtained by inspissating the expressed juice of the lemon after the rind has been removed for the sake of the essential oil.'—Watt's *Dictionary of Chemistry*, vol. i. p. 995.

The most important of the numerous salts of citric acid are the citrates of lime, potash, ammonia, and iron. *Citrate of Lime* ($C_{12}H_5O_{11},3CaO+4Aq$) is formed in the preparation of citric acid, and is a fine white crystalline powder, more soluble in cold than in hot water. *Citrate of Potash* ($C_{12}H_5O_{11},3KO+2Aq$) is formed by neutralizing the acid with carbonate of potash, and crystallizes in clear deliquescent needles, insoluble in alcohol. *Citrate of Ammonia* ($C_{12}H_5O_{11},3NH_4O$) can only be obtained in solution. *Citrate of Iron* is prepared by dissolving freshly precipitated peroxide of iron in a warm solution of citric acid; a reddish-brown solution is formed, which, on evaporation, yields brilliant scales of a light-brown color. Excepting the first, all these salts ase employed in medicine—the citrates of potash and ammonia as diaphoretics and febrifuges (see AERATED WATERS), and the citrate of iron as a tonic. Lemon juice, in which citric acid is the most active ingredient, is a most valuable medicine in scurvy, active hæmorrhage, rheumatism, &c.; and when it cannot be obtained, citric acid is the best substitute. The general uses of citric acid in combination with an alkali have been already noticed.

CI'TRON (*Citrus medica;* see CITRUS), a tree cultivated in the south of Europe, and other warm, temperate, or sub-tropical countries for its fruit; a native of the forests of the north of India. By many botanists, it is regarded as a mere variety (or perhaps the original type) of the species which produces also the lemon, sweet lemon, lime and sweet lime; by others, these, or some of them, are regarded as distinct species. The C. has oblong toothed leaves; the flowers are externally of a violet color; the fruit is large, warted, and furrowed; the rind very thick and tender; the pulp sub-acid. The pulp is refrigerant; but the part chiefly valued is the rind which has a delicious odor and flavor; and is made into a very agreeable preserve. The juice is sometimes employed to make a syrup, or with sugar and water, for a beverage, and for flavoring liquors. The rind and juice may be said generally to be applicable to the same purposes as those of the lemon, but the juice is less acid. The CEDRATE is a variety of the C., from which chiefly the fragrant Oil of C., or OIL CEDRATE, used by perfumers, is procured. In Germany, the name Cedrate is extended to all kinds of C., and the name C. is usually given to the lemon. The varieties of C. are numerous. The fruit of the

largest kind is sometimes 9 inches long, and 20 lbs. in weight. The C. is frequently cultivated in Britain, and by the aid of artificial heat and the protection of glass is produced in great perfection.

Citron.

It is probable that the C. is meant in some passages of the Old Testament where the word apple is used in the English version.

CITRO'SMA, a genus of trees of the natural order *Monimiaceæ* of which the leaves abound in an oil resembling, if not identical with, oil of citron. They are natives of the tropical parts of South America.

CI'TRUS, a genus of plants of the natural order *Aurantiaceæ*, consisting of trees and shrubs, natives of India and other warm parts of Asia, but many of which are now commonly cultivated in all warm climates on account of their fruit. To this genus belong the ORANGE, CITRON, LEMON, LIME, BERGAMOT, SHADDOCK, POMPELMOOSE, FORBIDDEN FRUIT, &c. See these heads. It is distinguished by numerous stamens, irregularly united in bundles by their filaments, a pulpy fruit with a spongy rind, and smooth seeds. The leaves and the rind of the fruit abound in volatile oil. The flowers also contain volatile oil, and exhale a peculiar fragrance.

CITTADE'LLA, a town of Northern Italy, in the province of Padua, 14 miles north-east of Vicenza. It is situated on the Brentella, an affluent of the Brenta, is walled, and has woollen and paper manufactures. Pop. 7820.

CITTA' DI CASTE'LLO, a town of Central Italy, 25 miles north-west of Perugia. C. has a very pleasant situation on the left bank of the Tiber. Though a place of only some 5580 inhabitants, it is exceedingly rich in ecclesiastical structures of Gothic architecture, palatial residences, and works of art. Raphael painted many of his early works in C. di C.; and they were to be found in churches and private galleries here until the French invasion, when they were dispersed. Two small pictures of this great master still remain in Citta di Castello. Silk-twist is the chief manufacture of the town.

CITTA VE'CCHIA. See MALTA.

CI'TY (Fr. *cité*, Lat. *civitas*). In the sense in which it was first used in the Romanic languages of modern Europe, the word C., like its Latin orignal, was probably equivalent to State (q. v.) (*respublica*) rather than to town or borough (*urbs*, *municipium*); and whilst the latter signified a collection of hearths and households, governed by municipal laws internally, but subject externally to the laws of the country of which they form a part, the former was applied only to such towns as, with their surrounding district, were independent of any external authority whatever. Nearly the only cities in this sense now are the free towns of Germany, and such of the cantons of Switzerland as consists chiefly of a town and its surroundings, for example, Geneva. But as the ancient Gauls, though composing one nation were divided into tribes, living in different cantons, each with its town, to which the term *civitas* was applied, and as they also acknowledged a species of central authority, several cities sending delegates to a central one of greater extent and importance to discuss their common affairs, there is reason to believe that the term C. was applied *par excellence* to these central places of meeting, and that it thus, from a very early period, signified a *capital* or *metropolis*, though not independent.

In England, the term is said to be confined to towns or boroughs which are or have been the seats of bishops' sees, but this restriction rests on no sufficient ground. 'The cities of this kingdom are certain towns of principal note and importance, all of which either are or have been sees of bishops; yet there seems to be no necessary connection between a city and a see.'—Stephen's *Com.*, i. p. 124. In America, the term is applied to all towns which are incorporated and governed by a mayor and aldermen. See BOROUGH.

In the case of towns which have grown greatly beyond their original dimensions, it is not unusual to give the name of C. to the space which they originally occupied—thus, we speak of the C. of London, the C. of Paris, of Vienna, &c.

CITY OF REFUGE. The Jewish law (Numb. xxxv., Deut. iv., Josh. xx.) set apart six cities, three on each side of Jordan, as cities of refuge for the manslayer, in which he might find an asylum, and be safe from the avenger of blood. See BLOOD, AVENGER OF. These cities were Hebron, Shechem, and Kadesh-Naphtali on the west of Jordan; Bezer, Ramoth-Gilead, and Galan, on the east. The Jews were careful to keep the roads to the cities of refuge clear, and signs were set up to show the way. The manslayer was received and protected in the C. of R. until the death of the high-priest, after which the avenger of blood had no longer any claim against him. Thus this peculiar institution was connected with the typical institutions of the Jewish religion, and partook somewhat of their character, whilst it modified and restrained the avenging of blood. The C. of R. afforded no permanent protection to the murderer, who, if his crime could be proved against him, was to be taken from it that he might be put to death.

CIUDA'D (from the Lat. *civitas*) is the Spanish word for 'a city;' and is used as a prefix corresponding to the English affix *town*, as in

CIUDAD BOLIVAR. See ANGOSTURA.

CIUDAD REA'L, a town of Spain, capital of the province of the same name, situated on a plain between the rivers Guadiana and Jabalon, about 100 miles south of Madrid. It is surrounded with walls in parts ruinous, and has some handsome houses; but, on the whole, is a poor dull place. It has two or three fine churches—the nave of the parish church being one of the finest Gothic specimens of the kind in Spain—and several monasteries. There are manufactures to a small extent of coarse woollens, linen, and table cloths, and a trade in the agricultural produce of the district. Pop. (1877) 13,589.

CIUDAD RODRI'GO (Roderic's Town), a fortified town of Spain in the province of Salamanca, about 50 miles south-west of the city of that name.

It is situated on an elevation above the river Agueda, which washes the walls, and is here crossed by a fine bridge. It has a cathedral, the earliest portion of which dates from the 12th century. The town generally has a mean appearance, and is not over-cleanly. During the Peninsular War, C. R., though of little strength itself, was considered a place of the utmost importance, as a key of Spain on the west, and was consequently an object of ambition both to the French and the allies. In June 1810, the French under Massena invested the town, and after a gallant defence by the Spaniards, it was forced to surrender on the 10th July. The fact that Wellington was in the immediate vicinity, with an army of 30,000 men, and afforded no relief whatever, was a subject for outcry against the hero; but subsequent events at Torres Vedras showed that his policy was the right one. In January 1812, after a siege of 11 days, the place was assaulted, and after a bloody struggle, the British succeeded in capturing the town. The storming is one of the most brilliant achievements recorded in British military annals, and important as it was brilliant; 150 guns fell into the hands of the captors, besides vast stores of every kind, and the moral effect was even more than proportionately great. Pop. (1877) 6856.

CIUDADE'LA, a seaport town of the island of Minorca, situated on a plain on the west coast, in lat. 39° 58′ N., long 3° 52′ E. It is walled, and has a cathedral, also several convents. The inhabitants, numbering between 7000 and 8000, are engaged in agriculture and the manufacture of woollen fabrics. A considerable trade is carried on at the port.

CI'VET (*Viverra*), a genus of carnivorous quadrupeds, of the family *Viverridæ* (q. v.), having the body elongated, in some of the species as much as in the weasel tribe; the head is also long, and the muzzle sharp. The ears are short, broad, and rounded. The feet have five toes, and the claws are only semi-retractile. There is a more or less conspicuous erectile mane along the back, as in hyænas. Between the anus and the sexual organs, in both male and female, there is a large double pouch, in which is secreted a peculiar odoriferous fatty substance, called *Civet*, much used as a perfume. The use of this pouch and its secretion to the animal is not very well known. There are several species of C., of which

the best known is the common or African C. (*V. civetta*), a native of the north of Africa. The common C is from two to three feet long. The height is from ten inches to a foot; the hair long, brownish gray, with numerous black bands and spots. The C. preys on birds, small quadrupeds, and reptiles, and generally takes its prey by surprise.

It is very commonly kept in confinement for the sake of its perfume, which is removed from the bag about twice a week by means of a small spatula, and is obtained most abundantly from

Civet.

the male, and especially after he has been irritated. A dram is a large quantity to obtain at a time. The civets kept for this purpose are fed on raw flesh; the young partly on farinaceous food. The town of Enfras, in Abyssinia, is a principal seat of the C. trade, and great numbers are there kept.

CIVIDA'LÉ, a walled town of Venetia, Northern Italy, about 10 miles east-north-east of Udine, situated on the Natisone, which is here crossed by a bridge. C. is the ancient *Forum Julii*, and its collegiate church, a fine Gothic edifice, dates from the 8th century. In its archives are contained some valuable manuscripts. It has silk and cotton factories, and a population of some 4500.

CI'VIL DEATH. Death, in a legal point of view, is either natural or civil: the former being the cessation both of physical life and of the legal rights which attach to it; the latter, the cessation of the legal rights whilst the physical life remains. 'Civil death occurs where a man, by act of parliament or judgment of law is attainted of treason or felony; for immediately upon such attainder he loses (subject indeed to some exceptions) his civil rights and capacities, and becomes, as it were, *dead* in law. It also took place formerly where any man abjured the realm by the process of the common law; or entered into religion, that is, went into a monastery, and became there a monk professed; in which cases he was absolutely dead in law, and his next heir should have the estate. Even in the times of popery, the law of England took no cognizance of *profession* in any foreign country, because the fact could not be tried in our courts; and therefore, since the Reformation, this disability is held to be abolished; as also the disability of banishment, consequent upon abjuration, by stat. 21 Jac. I. c. 28.' Stephen's *Com.*, vol. i., pp. 142, 143.

CIVIL ESTA'BLISHMENTS, of the Army, comprise certain departments which, though provided for out of the Army Estimates, are non-military in their organization; such as those connected with the manufacture of munitions of war.

CIVIL LAW. See LAW.

CIVIL LIST. Down to the period of the Restoration in 1660, notwithstanding an attempt at negotiation between James I. and the parliament for the commutation of the hereditary revenues of the crown, the whole expenses of the government of England, civil and military, were included in one list, or rather they were defrayed out of what was called the royal revenue. This revenue arose partly from crown lands, and partly from other sources, and for a long period after the Conquest, it was really at the disposal of the crown. Even after the supplies were provided by parliament, the specific mode of their expenditure continued to be free from parliamentary control. But at the Restoration a distinction was made (by statute 12 Charles II.) between the extraordinary expenses occasioned by war, and the ordinary cost of the civil establishments of the country. For the latter, the needful funds were provided, partly from such crown-lands as were still unalienated, and partly from taxes which parliament voted for the purpose at the commencement of each reign. These were called the hereditary or C. L. revenues. During the reign of William III., the C. L. amounted to £680,000 annually. The branches of expenditure included under this head were the following: 1. The royal household; 2. The privy purse; 3. The royal palaces; 4. The salaries of the chancellor, judges, great officers of state, and ambassadors; 5. The incomes given to the other members of the royal family; 6. The secret-service money, pensions, and other irregular claims. The support of the army and navy was now provided for by an annual vote of the House of Commons, and the interest of the national debt was never charged against the civil list. During Queen Anne's reign matters remained nearly on their former footing; but on the accession of George I., the C. L. was raised to £700,000 a year, and on that of George II., to £800,000. George III., notwithstanding that he had surrendered very large portions of the remaining hereditary revenue of England, accepted the last-mentioned sum. But it proved insufficient for the purpose. A large amount of debt was incurred, and in 1769 and 1777, parliament voted sums for his relief, amounting together to more than £1,000,000. In 1777, the C. L. revenue was raised to £900,000, but further deficiencies to the extent of £270,000 had still to be supplied by extraordinary votes. In 1780, Mr. Burke succeeded in abolishing several useless offices, and reducing the expenditure. Notwithstanding these and other efforts in the same direction, it was found indispensable continually to augment the C. L. revenue. In 1804, it was raised to £960,000, and in 1812, to £1,080,000, besides annuities to members of the royal family, which were now paid out of the Consolidated Fund (q. v.) to the amount of £260,000. When George IV. succeeded to the throne, £255,000 of expenditure was transferred to other funds, and the C. L. was then fixed at £850,000 per annum. The crown enjoyed, in addition, the hereditary revenue of Scotland, amounting to about £110,000, and a separate C. L. was kept up for Ireland of £207,000.

Against these large sums, however, were still placed many charges which belonged to the nation rather than the crown; and it was not till the 15th November, 1830, that Sir Henry Parnell, afterwards Lord Congleton, carried a motion for the appointment of a select committee for the purpose of separating the proper expenses of the crown from all other charges. The result of this measure was the act (1 Will. IV. c. 25) for the regulation of the civil list. The sum of £510,000 was now granted to his majesty, and exclusively devoted to the privy purse, the salaries and expenses of the household, secret-service money, and pensions. The separate list for Ireland was discontinued, and the Scotch hereditary revenues and other items were directed to be paid into the Exchequer. The change was rather a new distribution, which enabled the country to look more closely into its expenditure, than a real reduction of the civil list.

On the accession of Queen Victoria, the C. L., which had long been of the nature of a compact between the monarch and the parliament, and as such beyond the control of parliament during the life of the sovereign, was settled by 1 and 2 Vict. c. 2. The Queen surrendered the hereditary revenues of the crown for life, in consideration of a yearly sum of £385,000 to be devoted solely to the support of her Majesty's household, and the honor and dignity of the crown. The application of this sum to the particular branches of the Queen's privy purse, the salaries and expenses of the household, the royal bounty, alms and special services, is intrusted to the Lords of the Treasury; and it is provided that if the C. L. charges in any one year shall exceed the total sum of £400,000, an account of the particulars of excess shall be laid before parliament in thirty days. Besides the above sum, £1200 a year is intrusted to her Majesty for the payment of pensions, 'to persons who have just claims on the royal beneficence, or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science, and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude of their country.'

CIVIL SE'RVICE is a general name for all the duties rendered to and paid for by the state, other than those relating to naval and military matters. At the head of the British C. S., which numbers above 50,000 officials of all grades, are placed the officers of the Royal Household, under several departments. Then come the officers of the House of Lords and the House of Commons. Then a vast number of offices or departments, of which the following are the more important: Treasury, Home Office, Foreign Office, Colonial Office, India Office, War Office, Admiralty, Board of Trade, Post-office, Customs, Inland Revenue (including Stamps, Taxes, and Excise), Exchequer and Audit Office, Office of Woods and Forests, Office of Works and Buildings, Duchy of Lancaster, Public Record Office, Local Government Board, Education Department, Civil Service Commission, Registrar-general's Office, Stationery Office, Ecclesiastical Commission, Charity Commission, Patent Office, Emigration Office, Trinity House, Heralds' College, Law and Equity Courts, Ecclesiastical and Admiralty Courts, Prisons Department, British Museum, Science and Art Department, Diplomatic and Consular Corps. Several departments peculiar to Scotland and Ireland form distinct lists, not included in the above.

The heads of most of the departments are political officers, changing with the Ministry. Others, such as the head of the Exchequer and Audit Department, or the Commissioners of Customs and of Inland Revenue, are permanent officials. Excluding the judicial offices, and a few departments where special knowledge is required, the C. S. is open to the public generally, the principle of open competition being in force as regards most of the departments.

In former times appointments to the government offices were obtained mostly by favor; but now, merit and abilities are condi-

tions superadded. By an Order in Council, dated May 21, 1855, the system was first placed on a new basis, and a commission was appointed to examine all candidates for the service. A candidate being *nominated*, the Commissioners in due time notified that he must come up to be examined, and produce certificates of birth, health, and character. The heads of the several departments agree with the Commissioners as to the extent and nature of the subjects on which the candidates should be examined. The Commissioners neither nominate nor appoint; they only examine, and notify the result of the examination.

By an Order in Council, dated 4th June 1870, the regulations were altered, the rule of open and unrestricted competition being then introduced, qualified by some exceptions. In certain small and special offices, nomination with subsequent success at an examination remained the rule of entry. But for all the principal departments—the Foreign Office being the only prominent exception—there is open competition, to which all British subjects of the required age and of good health and character, are admissible. For offices of the superior grade, the age is from 18 to 24, and in the lower division, the age is from 17 to 20. Boy clerks must be over 15 and under 17. Any successful candidate remaining on the list without obtaining an appointment, is struck off at the age of 25. Boy clerks who at 19 fail to obtain appointments as man clerks are also struck off. The first open competition held was on 22d February 1871, when 30 situations in the Excise were competed for by a large number of candidates. A further change was made by the introduction of 'writers'—a species of 'uncovenanted' clerks, who were paid by the hour, were dismissible at pleasure, and had no claim to pension. Writers were first introduced in August 1870, and 'boy clerks' were sanctioned in July 1870.

These various changes (tending in the opinion of the service to lower the status of the officers) and the increased cost of living resulted in great agitation throughout the C. S., and in the appointment of a commission under Dr. Lyon Playfair, to reconsider the whole system of C. S. organization and pay. Following on reports from this commission, considerable changes were made. The decision that the lower grade should have no claim to rise above £200 a year, or to obtain promotion into the higher grade, and the introduction of 'duty-pay' as a means of rewarding special responsibilities, may be named amongst the chief alterations. The Playfair commission reported against the employment of temporary writers; and that class of employees ceased to be appointed after the issue of the Order in Council of 12th February 1876, though a small class of temporary 'copyists' is still maintained. The granting of pensions to the C. S. is now regulated by acts passed in 1859 and 1871, the latter allowing the commutation of pensions for a slump sum when these have been granted on abolition or reorganization of office. The rate of pension is one-sixtieth of pay for each year's service.

The more important departments of the C. S. are briefly described under their proper headings. For the Indian Civil Service, see INDIA, BRITISH.

CIVIL SERVICE E'STIMATES include all expenses of the state not provided for in the Army and Navy Estimates. As an example of these C. S. E., we will quote the amounts voted under their various heads for the financial year beginning April 1, 1881, and ending March 31, 1882:

Public works and buildings	£1,506,673
Salaries and expenses of public departments	2,407,536
Law and justice	5,948,746
Education, science, and art	4,458,456
Colonial and consular services	548,027
Superannuation and retired allowances and gratuities	1,172,156
Miscellaneous and special	45,510
	£16,087,104

CIVI'LIAN. This term has three meanings which are distinct, though intimately related. 1. In a popular sense, it signifies a person whose pursuits are civil; i. e., neither military nor clerical. 2. As a law-term, it means, either a person who is versed in the principles and rules in accordance with which civil rights may be freely, blamelessly, and successfully vindicated in society generally, or in the particular state to which he belongs—or 3. One who has made a special study of these rules and principles as exhibited in the laws and government of Rome (the Roman civil law).

The civil law of Rome exercised such influence upon the formation of the municipal systems of almost all the states of modern Europe, that those who devoted themselves to its study were regarded as 'civil' or municipal lawyers *par excellence*. From the more learned training which this study demanded, C. came often to be used as synonymous with professor or doctor, as opposed to practitioner of law; the former being generally more deeply versed in the Roman law than the latter; and this in its turn led to its being loosely applied to the international lawyers of the 17th c. (Grotius, Puffendorf, &c.), who generally belonged to the class of civilians in the sense of Romanists, and who, though their subject was altogether different, quoted largely and derived many analogies from the Roman jurisprudence. At present, from our having in Great Britain no class of persons who prosecute law as a *science* as opposed to an *art*, the term C. has reverted to its narrower medieval sense of student or teacher of the Roman civil law, and thus we speak of Savigny as a C., but not of Story. The special sense in which C. is understood in England will be explained under ECCLESIASTICAL COURTS. See also ADMIRALTY COURTS.

CIVILIZA'TION. This is a general term to designate the condition of the more advanced nations, as contrasted with those that are looked upon as barbarians or savages. We term the leading nations of Europe civilized; the Chinese and Tartars less so; the Red Indians, Australians, Esquimaux, least of all. 'Whatever be the characteristics of what we call savage life, the contrary of these, or the qualities which society puts on as it throws off these, constitute civilization. Thus, a savage tribe consists of a handful of individuals, wandering or thinly scattered over a vast tract of country; a dense population, therefore, dwelling in fixed habitations, and largely collected together in towns and villages, we term civilized. In savage communities, each person shifts for himself: except in war—and even then very imperfectly—we seldom see any joint operations carried on by the union of many; nor do savages, in general, find much pleasure in each other's society. Whenever, therefore, we find human beings acting together for common purposes in large bodies, and enjoying the pleasures of social intercourse, we term them civilized.' And so of other characteristics. *Dissertations* by J. S. Mill, art. 'Civilization.'

When we come to seek for an exact definition of the term C., we meet with a variety of views, implying that there is a certain complication in the subject. The original derivation of the word points to that polish of manners that distinguishes the inhabitants of cities (Lat. *cives*) from the rustic population; but the use of the word has greatly outgrown this limitation. Guizot has given a definition, which has become generally known, to the effect that we are to include in C. the improvement of man both socially and in his individual capacity. But the chief difficulty lies in settling what is *improvement*. That people are far from agreed on this point is evident from the use of the phrase, 'vices of civilization.' How are we to distinguish its vices from its virtues?

The question is very much simplified by making a distinction between *aiming at* the improvement of mankind and really *effecting* that object. All our inventions and discoveries, and all our new arrangements introduced into every department of life, are intended to raise us further and further above the savage condition; nobody denies this; but there may be the widest difference of opinion as to whether any one new device is a real improvement. If we were to restrict the term C. to the changes introduced into human life *with a view* to improvement, the definition of it would present no difficulty; whereas the relation of this to *progress*, or actual improvement, must ever remain open to difference of opinion.

Leaving out of view for the present the disputable matter, C. may be explained as follows: In the first place, there are certain things bearing decidedly on human preservation and human happiness that are to be excluded from the definition. C. is *not* natural advantages—such as those of soil and climate; or the goodness of the mental or bodily constitution of the race; or accidents of fortune favoring our exertions; or individual dexterity or skill that cannot be imparted. It is not necessarily happiness, which is sometimes present in a low C. and absent in a high. *The permanent changes in the condition and arrangements of man's life effected by his own intelligence and exertions* make up human civilization. It is the *artificial* half of the good we enjoy. Nature has given us so much; our own powers of contrivance give the rest. Genius (in the sense of intellectual originality) is the cause, and C. the effect.

Such being the general definition, the enumeration of the separate departments is the enumeration of the institutions of civilized life. These may be briefly summed up under the following heads:

1. The *Industrial Arts*, or the devices fallen upon for turning to advantage the material resources and agencies of the globe. Perhaps no one will be found to dispute that these constitute real improvements.

2. The *Government*, or system of political organization. It is here that we are most forcibly convinced of the propriety of distinguishing C. from *absolute progress*, or the devices intended for improvement from actual improvement. Scarcely anything in the whole political system of Great Britain, for instance, has commanded unanimous approbation first and last; nearly all the changes have been carried against reluctant minorities, and every now and then voices are raised against institutions accounted by the mass of the nation the very bulwark of our national greatness; as, for example, the parliamentary control of the sovereign authority.

One aim of social reformers has been to make the necessary functions of government compatible with a larger and larger range of individual liberty. The majority of men call this state of things not merely an intended but a real improvement; not merely C., but progress. Still, there is never wanting a class of minds that see only the disadvantageous side of this and all other social innovations.

Connected with liberty, we may also notice the growth of humane sentiment in all classes, the governing power included. When we revert to the horrible punishments to which men were subjected in this country, not many generations since, not only for real crimes, but out of mere superstitious antipathies, as in the burning of witches, we are apt to feel ashamed of our own ancestors, and to congratulate ourselves on having our lot cast in a milder age.

3. The *Arts of Social Intercourse*, embracing the material machinery of conveyance and communication; and also what may be called the moral machinery, such as forms of procedure for regulating assemblies, and the minor courtesies of life.

4. The scheme of *Morality* established in a community appertains to their civilization. But in this also, difference of opinion prevails, when we compare different countries and times. Morality, in fact, has always been more or less a part of *Religion*, which must also be viewed as an institution pertaining to civilized men, whether of their own invention or the result of supernatural communication. In any case, there is mixed up with every religion much that is purely human, and which may be judged of by its tendencies to promote human welfare, like any other arrangement of society. This being the subject of all others that men have most differed upon, no criterion of progress can be laid down, because none would be universally received. The unconverted pagans alive at the final establishment of Christianity, naturally believed that the human mind was thrown backward by that event.

5. *Science* is the least disputed of all the ingredients of civilization.

6. *Literature* and the *Fine Arts* make part of the C. of mankind. They are a new class of pleasures, superadded to the gratifications of mere sense, and of a kind that can be partaken equally by a large number of people. Instead of rivalry and contention, which are inseparable from the struggle for food, money, or power, the Arts tend to sociability and good-fellowship. Every contribution to Architecture, Painting, Music, &c., is a result of human genius, and intended for human pleasure; but there is not the same unanimity in this case as in the former; for many kinds of art are objected to as corrupting the mind; and too great a devotion to Art, on the whole, is said to endanger the just balance of men's regards to the serious interests of life.

The above enumeration will amply show how to define the term C., and of what parts the total is made up. It has also been made apparent that the point as to whether any invention be an item of genuine *progress*, is, and ought always to be, an open question. The inventions of original minds intended for placing us further and further from the savage condition, and having that effect, may often be accused of producing new evils, which other arrangements are called for to neutralize. See works on the History of C. by Guizot, Draper, Buckle; and on the anthropological side, Lubbock's *Origin of Civilization* and Mr. Tylor's works.

CI'VITA CASTELLA'NA, a town of Central Italy, about 30 miles north-east of Rome, on a plateau of volcanic tufa above the Rio Maggiore. Pop. 4000. It is chiefly remarkable on account of the vast number of its Etruscan remains. It occupies the site of the ancient *Falerium Vetus*, one of the 12 cities of the Etruscan League; and *Falerii Novi*, of which also there are many remains, stood about 4 miles to the north of Civita Castellana.

CIVITA DI PE'NNE, a town of South Italy, in the province of Teramo, situated on a commanding hill about 20 miles south-east of Teramo. It is an ancient place, having, under the name of *Pinna*, been the chief city of the Vestini; and some remains are still found here. The modern town, though containing some fine edifices, including the cathedral, is in general badly built. C. di P. is noted for its manufactory of silk-flowers. Pop. 9800.

CIVITA SAN-A'NGELO, a town of South Italy, in the province of Teramo, situated near the Adriatic, about 25 miles south-east of Teramo. It has a population of 6000, and an active trade.

CIVITA VE'CCHIA, an Italian city in the province of Rome, is situated on the Mediterranean, in lat. 42° 4′ N., long. 11° 45′ E. Its ancient name was *Centum Cellæ*. The harbor of C. V. is one of the best in Italy, and was constructed by the Emperor Trajan; the town, indeed, owed its origin entirely to the port of this emperor, and hence it was also known as Portus Trajani. The harbor is formed by two artificial moles projecting into the sea, while a third constructed between the two serves to protect the harbor from the heavy sea; upon this third and outward mole there is a good lighthouse, some 80 feet above the level of the sea. Within the port, there is a small dock and an arsenal. The town of C. V. is small, and has no buildings of any note except a large church in the principal street. The streets are ill paved and narrow, and the inhabitants poor. Pop. about 10,500. It is a free port, and is regularly visited by steam-packets from Marseille, Leghorn, Naples, Genoa, Messina, and Malta; while the majority of travelers visiting Rome land here. It is famous among the modern Italians for its oysters, which are extremely small, but delicious to the taste.

CIVITANO'VA, a town of Central Italy, province of Macerata, 12 miles west of the town of Macerata. Population, including the port, 8583. It stands not far from the Adriatic, and has a fine harbor, much frequented. Its lands produce vines, olives, and pasturage. It is an industrial and commercial city.

CIVITE'LLA DEL TRO'NTO, a town of South Italy, in the province of Teramo, ten miles north of Teramo. It is situated on a rock, is fortified and defended by a strong castle. C. del T. is historically interesting as the place where, in 1053, Robert Guiscard and his Normans gained a complete victory over the forces of Pope Leo IX., and the Emperor Henry III. of Germany; and also for the siege it sustained in 1557 against the French and papal army under the Duke of Guise, who was finally forced to retreat.

CLACKMA'NNAN, the county town of Clackmannanshire, in the south part of the county, on the Devon, near its confluence with the Forth, 9 miles east of Stirling. It lies on ground rising 190 feet above the rich carse-land of the plain of the Forth, which is also rich in coal, iron, and limestone. C. was formerly a royal burgh, and is mentioned as such in the acts of parliament of James V. in 1540 and 1543. From a bull of Pope Celestine III., dated 1195, it appears that at this early date the church and its chapels, together with forty acres of land, belonged to the Abbey of Cambuskenneth. In 1330, King David Bruce resided at Clackmannan. In 1358—1359, King David II. confirmed to Sir Robert de Bruce the castle and barony of C., with the lands of Kennet and others; and from that period to the present, the Bruces have been proprietors in this parish. Pop. (1881) 1503.

CLACKMA'NNANSHIRE, the smallest county of Scotland, bounded N. and W. by Perthshire and the Ochil Hills; E. by Perthshire and Fifeshire; S. by the Forth, separating it from Stirlingshire. Its greatest length is 10 miles; area, 48 sq. miles. Pop. (1871) 23,747; (1881) 25,680. It chiefly consists of the valley of the North Devon, gently declining from the green Ochil Hills to the Forth. The Ochils consist of trap, especially amygdaloid, claystone, porphyry, and greenstone, and rise in Bencleugh (more properly Benclach) 2352 feet, and Dunmyat, or Demyat, 1345. A ridge of high ground, with inferior soil, often resting on clay, runs west through the middle of C., between the very fertile alluvial lands resting on the coal-measures in the south, and the North Devon valley in the north, where the soil is loamy, and rests on gravel, and also on the coal-measures, which extend to the base of the Ochils. The chief minerals are ironstone, sandstone, greenstone, coal, limestone, silver, copper, antimony. The chief rivers are the North Devon, rising in the south of Perthshire, and the Black Devon, rising in the south-west of Fifeshire; both run west across C. into the Forth.

The river Forth is navigable for vessels of 500 tons up to Alloa, at which port ships of 700 tons register have been built. The chief crops are wheat, barley, and oats. The number of acres in C., under all kinds of crops, bare fallow, and grass, in 1881, was 15,758; under corn crops, 5899; under green crops, 1463; clover, sanfoin, and grasses in rotation, 3569; permanent pasture and meadow land, 4546. The 'Hillfoots' have long been celebrated for their woollen manufactures, chiefly in tartan shawls and plaids, and have become favorably known in the production of tweeds. The district is likewise famed for its ale, there being several breweries in the county. There are also extensive distilleries. There are manufactures of green glass bottles, earthenware, bricks and tiles, also timber trade and ship-building. The chief exports are iron and coal. The columnar greenstone of Abbey Craig, near Stirling, has come into use for grinding flour, which it does nearly as well as the French burr-stones. C. contains four parishes. The chief towns are Clackmannan, the county town; Alloa, the most important place; and Dollar, noted for its endowed educational establishment. C., with Kinross-shire, returns one member to parliament; but the county occupies the anomalous position of having parishes within its circumference politically—Alva in Stirlingshire, and Tulliallan and Culross in Perthshire—which it does not embrace judicially. In C. have been found Roman stone coffins, sepulchral vases, and odd Roman coins. The Marquis of Montrose, in 1645, burned Castle Campbell, now a noble ruin situated on a wild but easily accessible eminence, on the brow of a hill immediately behind Dollar. In C., George Meikle constructed, in 1787, the first effective thrashing-machine in Scotland.

CLA'DIUM (Gr. *clados*, a branch or twig), a genus of plants of the natural order *Cyperaceæ*, of which one species, *C. Mariscus*, is a native of Britain, particularly common in the bogs and fens of

Cambridgeshire, where hundreds of acres are almost entirely covered with it. It is 3—5 feet high, with a rounded leafy stem, the keel and margins of the leaves rough and almost prickly. It is consequently hurtful to cattle. It is used for thatching, and in Cambridgeshire also for lighting fires. The English name Twig-rush has been given to it, but is only of recent invention.

CLAIM, in English Law, is a challenge of interest in anything that is in the possession of another, or at least out of a man's own possession. Claims are either verbal or by action, and relate either to lands or to goods and chattels; their object being generally to preserve a title which otherwise would be in danger of being lost.

CLAIM OF LIBERTY is a suit or petition to the Queen in the Court of Exchequer, to have liberties and franchises confirmed there by the attorney-general (Tomlins' *Law Dic.*).

CLAIR, St., a river of North America, being that part of the St. Lawrence, in its largest sense, which carries into Lake St. Clair the waters of Lake Huron. It is 30 miles long, and half a mile broad, and easily navigable, its depth being 50 feet. Lake St. Clair measures 30 miles in length by 12 in average width, and communicates at its south-west end with Lake Erie by means of the Detroit.

CLAIRAC, a town of France, in the department of Lot-et-Garonne, situated on the Lot, about 16 miles north-west of Agen. It has flour and paper mills, and a considerable trade. C. is chiefly interesting, however, as the first place in the south of France that embraced the doctrines of the Reformation, which it did in 1527, on the example of its abbot, Gerard Rouselle. It was the scene of frequent contests between Roman Catholics and Huguenots. Pop. (1876) 2388.

CLAIRAUT, Alexis Claude, an eminent French mathematician, was born at Paris, May 7, 1713. He early exhibited a most remarkable aptitude for mathematics, and was considered worthy of admission to the Academy of Sciences, while as yet he was only 18 years of age. C. wrote a great number of scientific papers, but his fame now rests principally upon his *Figure of the Earth*, in which he promulgated the theorem, that the variation of gravity on the surface of the earth, regarded as an elliptic spheroid, was altogether independent of the law of density, the opposite opinion having been previously held; on his explanation of the motion of the lunar apogee, a point left unexplained by Newton; and on his computation of the time of the return of Halley's comet. He died at Paris, May 17, 1765.

CLAIRE, St., or *Santa Clara*, was born in 1193, of a rich and noble family of Assisi, in the duchy of Spoletto. Attracted by the eloquence and piety of St. Francis of Assisi, she abandoned the pleasure of social life, in which she had previously indulged, and betook herself to solitude, prayer, and mystic meditation. Her imagination, excited by religious emotions, deceived her into the belief that she was in more direct communication with God than her fellow-mortals; and taking her own desires for divine intimations, she founded an order of nuns in 1212, and after obtaining a great reputation for sanctity, died at Assisi, August 11, 1253. Two years afterwards, she was canonized by Alexander IV.

CLAIRE, St., Nuns of the Order of, a religious order founded by St. Claire, with the counsel and help of St. Francis of Assisi, in 1212. At first, the nuns observed the rule of St. Benedict, but in 1224 the austerity of this rule was mitigated by St. Francis, and again modified by Urban IV. in 1264. Those who follow the rule as modified by Urban, are called *Urbanists*; the other and austerer portion of the sisterhood, *Damianists*. The order rapidly increased; and convents are numerous to the present day in Italy, France, Belgium, Bavaria, Asia, and America. The nuns devote themselves chiefly to the education of the young.

CLAIRVAUX, a village in the department of Aube, about ten miles above Bar-sur-Aube, on the left bank of the river, is remarkable as the site of the once famous Cistercian Abbey (Clara Vallis), founded in 1114 by St. Bernard, who presided over it till his death in 1153, when he was buried in the church. Besides the original buildings, a new and splendid convent was afterwards erected, and a church which was reckoned a masterpiece of architecture, but was destroyed at the Restoration. There was shown in the convent a monster cask, called 'St. Bernard,' which contained 800 tuns. The abbey, which had at one time a revenue of 120,000 livres, was suppressed at the Revolution, and the extensive buildings are now used as a workhouse and house of correction.

CLAIRVOY'ANCE. See Somnambulism.

CLAM. See Chama.

CLAM, in Heraldry, is a term for an escalop or cockleshell, and is supposed to indicate that the bearer has been a crusader, or has made long voyages by sea.

CLAM, BEAR'S PAW (*Hippopus maculatus*), a bivalve mollusk of the South Seas of the family *Tridacnidæ*. The shell is described as 'perhaps the most beautiful of bivalves, whether in regard to form, texture, or color.' It is therefore a favorite shell for ornamental purposes. It is transversely ovate, ventricose ribbed, roughened with scaly inequalities, white, and spotted with red or purple.

CLAN (Gael. *clann*, Manx *cloan*, meaning 'children,' i. e., descendants of a common ancestor). This word became incorporated with the English language at least as early as the 17th c., to mean a body of men confederated together by common ancestry or any other tie, and in this sense it is used both by Milton and Dryden. It came to be applied almost exclusively to the several communities of the Scottish Highlanders, as divided from each other topographically and by distinctive surnames. The word has sometimes been applied to those great Irish septs which at one time were a sort of separate states; but these, with their characteristic forms of internal government, were completely broken down by the power of the English predominance, before the word came into familiar use in the English language. In Scotland, it was used in the 16th c. to designate the freebooters of the border as well as to the Celtic tribes of the Highlands; and there were two characteristics common to both—their predatory habits, and their distribution into communities, each with a common surname.

In the act of the Scottish parliament of 1587, for instance, which requires landlords to find security for the conduct of their tenants, it is provided that those 'who have their lands lying in far highlands or borders, they making residence themselves in the inlands, and their tenants and inhabitants of their lands being of clans, or dependars on chieftains or the captains of the clans, whom the landlords are noways able to command, but only get their mails (or rents) of them, and no other service or obedience, shall noways be subject to this act but in manner following.' Then follow provisions for enforcing the law directly on the chieftains or captains of those clans residing in territories where the owner of the soil—generally the merely nominal owner, in terms of some useless charter—had no control. It was always the policy of the old law of Scotland to require all the Highland clans to have some respectable representative—a man of rank and substance, if possible—who should be security at court for their good conduct. Clans that could find no security were called 'broken clans,' and their members were outlaws, who might be hunted down like wild beasts. The Macgregors were a celebrated broken C., whom the law pursued for centuries with savage ingenuity. Among other inflictions, their name was proscribed, and such members of the C. as endeavored to live by peaceful industry in the Lowlands, adopted derivations from it, hence we have the names of Gregor, Gregory, and Gregorson or Grierson. The clans are never treated in the old Scots acts with any respect, or otherwise than as nests of thieves and cut-throats. The following passage in the act of 1581 (c. 112), which virtually authorizes any Lowlander, injured by any member of a C., to take vengeance against all or any of his clansmen, contains a picturesque, though, for a legislative enactment, certainly a very highly colored account of the social condition of the Highland clans in the 16th century. 'The saids clans of thieves for the most part are companies of wicked men, coupled in wickedness by occasion of their surnames or near dwellings together, or through keeping society in theft or receipt of theft, not subjected to the ordinar course of justice, nor to ony ane landlord that will make them answerable to the laws, but commonly dwelling on sundry men's lands against the good-will of their landlords, wherethrough true men oppressed by them can have no remeid at the hands of their masters, but for their defense are oftentimes constrained to seek redress of their skaiths of the hail clan, or such of them as they happen to apprehend. Likewise the hail clan commonly bears feud for the hurt received by any member thereof, whether by execution of laws, or order of justice, or otherwise.' The Highland clans are often carelessly spoken of as a feudal institution, but in reality their distinctive character cannot be better understood than by keeping in view some peculiarities which set them in complete contrast with the feudal institutions of Britain.

All feudality has a relation to land, from the serf bound to the soil through the free vassal who possesses it, up to the superior or feudal lord, who commands services out of it. The descent to all rights connected with it is hereditary. Among the Highlanders, on the other hand, the relation was patriarchal, and had no connection with the land, save as the common dwelling-place of the tribe. It often happened, as the acts above quoted explain, that the head of a C. and the owner, according to feudal law, of the estates occupied by it, were two different persons. Clans did not acknowledge the purely feudal hereditary principle, and would elevate to the chiefship a brother or an uncle, in preference to the son of a deceased chief. It is a curious illustration of this, that in the rebellion of 1715, the notorious Lord Lovat, who had just

returned from France, being acknowledged by the C. Fraser as their chief, drew them away from the rebel army, to which the proprietor of the Fraser estates had endeavored to attach them, and arrayed them on the government side.

CLAN MACDU'FF, Law of, was a privilege of immunity for homicide anciently enjoyed by those who could claim kindred with Macduff, Earl of Fife, within the ninth degree. Macduff's cross stood on the march or boundary between Fife and Strathearn, above Newburgh; and any homicide possessed of the right of clanship who could reach it, and who gave nine kye (cows) and a colpindash (or young cow), was free of the slaughter committed by him. (Bell's *Dictionary*.)

CLANDE'STINE MA'RRIAGE. A marriage contracted without the due observance of ecclesiastical ceremonies, even where concealment was not the chief or only object of the parties, is generally called a clandestine marriage. But in Scotland, a distinction is made between marriages which are clandestine, and those which are simply irregular. All marriages which are not celebrated by a clergymen after proclamation of bans are irregular, and such of these irregular marriages as are entered into before a person professing to act as a religious celebrator, without being a minister of religion, are clandestine, and expose the parties, the celebrator, and witnesses to certain penalties. These penalties may be recovered before justices of the peace, on complaint by the fiscal; and the proceeding is not without some advantage to the parties, as the conviction is received as evidence of the marriage. In the eye of the law, clandestine and irregular marriages in Scotland are as valid as those in the face of the church, provided they be of such a kind as to establish the consent of the parties to become man and wife in point of fact.

But, notwithstanding the existence of this rule of the civil law, marriages in Scotland, in any other form than *in facie ecclesiæ*, are practically of very rare occurrence. Persons convicted before a magistrate of an irregular marriage are required to register such marriage, and the magistrate is bound to give notice of the conviction to the registrar; and if the irregular marriage is established in a competent court, the clerk of court is to give notice (17 and 18 Vict. c. 80). To put a stop to Englishmen crossing the Border, merely in order to celebrate irregular marriages, it was enacted by 19 and 20 Vict. c. 96, 'that after the 31st December 1856, no irregular marriage shall be valid in Scotland, unless one of the parties has lived in Scotland for the 21 days next preceding the marriage, or has his or her usual residence there at the time.' It is further enacted, that the parties to such a marriage may apply within three months, *jointly*, to the sheriff or sheriff substitute of the county, for a warrant to register it. Upon proof that one of them had lived for 21 days, or usually resided in Scotland, and that they have contracted marriage, the sheriff is to grant a warrant to the registrar of the parish to record the marriage. A certified copy of the entry, signed by the registrar, which he must give for 5*s*., is declared to be evidence of a valid marriage.

CLANDESTINE MORTGAGE, in England, is a second mortgage of lands, already mortgaged for a valuable consideration, the first mortgage being concealed, or not discovered in writing to the second mortgagee. It is provided by 4 and 5 Will. and Mary, c. 16, that in such circumstances the mortgager, or person so mortgaging his lands, shall have no relief, or equity of redemption, against the second mortgagee.

CLA'P-NET, a kind of ground-net much used by the bird-catchers of the south of England, who supply the London market. It consists of two equal parts or sides, each about twelve yards long, by two yards and a half wide, and each having a slight frame. These are placed parallel to one another, fully four yards apart, and by an ingenious contrivance, the pulling of a string is made to close them upon one another, so as to cover the oblong space between them. Call-birds, either in small cages, or fixed by braces, are placed about the net to decoy wild birds to the spot.

CLA'PPERTON, Hugh, one of those British travelers that led the way in exploring the interior of Africa, was born at Annan, in the county of Dumfries, Scotland, in 1788. At the age of 17, he went to sea; and being impressed into a man-of-war, he distinguished himself by his services, and was appointed to the rank of lieutenant. In 1817, he returned to England on half-pay. Having become acquainted in Edinburgh with Dr. Oudney, who was about to proceed to Bornu as British consul, the thoughts of C. were directed to Africa; and government appointed him and Lieutenant Denham to accompany Oudney in an exploring expedition into the interior of that continent.

After a short stay at Tripoli, they started in February 1822 for Bornu, where Denham separated from his companions, in order to carry his researches southward. C. proceeded westward accompanied by Oudney, who died by the way. He still pushed on alone as far as Sakkatu, but not being allowed to proceed further westward, retraced his steps, and, in company with Denham returned to England in 1825. The journey had done much for the knowledge of Africa, but the great geographical problem of the course of the Niger, was still much in the same position. To solve it, if possible, C.—the rank of commander having been conferred upon him—started again in August 1825, in company with Captain Pearce, R.N., Mr. Dickson, and Dr. Morrison. He had also Richard Lander as his confidential servant. They commenced their exploration into the interior from the Bight of Benin. His companions died early on the journey, but C. and his faithful attendant Lander reached Sakkatu. Detained here by the Sultan Bello, the vexation joined to the hardships of the journey so affected his health, that he died at Changary, near Sakkatu, April 13, 1827. C. was the first European that penetrated from the Bight of Benin into the interior of Africa, and followed the course of the Niger for a great way. Though without scientific education, he was an intelligent and unprejudiced observer, and made important additions to geographical knowledge—*Narrative of Travels and Discoveries in Northern and Central Africa in the years* 1822, 1823, *and* 1824, *by Denham, Clapperton, and Oudney* (Lond. 1826); *Journal of a Second Expedition into the Interior of Africa*, &c. (Lond. 1829); *Records of Clapperton's Last Expedition to Africa*, by Richard Lander (Lond. 1830).

CLAQUE (from Fr. *claquer*, 'to clap the hands,' or 'applaud') is the name given to a contrivance for securing the success of a public performance or production, by bestowing upon it preconcerted applause, and thus giving the public, who are not in the secret, a false notion of the impression it has made. This artifice came first into operation in theaters and concert rooms, and arose from friendly or party motives; but it is to be feared that it has spread into other departments of public life, not excepting even parliaments.

It was in Paris that it was first regularly organized and turned into a trade. One Sauton, in 1820, established an Office for the Insurance of Dramatic Success (Assurance des Succès Dramatiques), and was thus the organizer of the Parisian 'claque.' The directors or managers of a theater send an order to the Office for whatever number of 'claquers' they think necessary. If the success of a piece seems doubtful, as many sometimes as from 300 to 500 of these people are furnished with gratis tickets, and are often instructed at the rehearsals at what particular places they are specially to applaud.

How minutely the art is organized, may be seen from the exact division of functions among the several claqueurs. The 'commissar' is bound to learn the play by heart, and call the attention of the audience about him to the various beauties of the piece; the 'rieur' must laugh at every jest; the 'pleureur' (weeper) has to manifest his sensibility at the moving passages. This last part is generally assigned to women, in whom the frequent use of the handkerchief seems most natural. The 'chatouilleur' (tickler), on the other hand, endeavors by distributing bonbons, snuff, theater-bills, &c., and by lively conversation to keep his neigbors in good-humor; and lastly, the 'bisseur' calls *encore!* with the utmost enthusiasm, at the conclusion of the specified pieces of music.

The following incident, which found its way into the newspapers on the occasion of the death of the famous French actress, Mademoiselle Rachel, shows the ludicrous seriousness with which the members of the C. view their singular profession: Mademoiselle Rachel had just created a new character in a modern piece, and during the first evening, was loudly applauded. The next, however, she thought her reception by no means so warm, and she complained of it, adding that the C. did not do its duty. It turned out that the head of the C. had been ill, and that his place that evening had been supplied by a confrère from another theater. This individual, on hearing of the complaint that had been made, wrote to mademoiselle as follows: 'Mademoiselle—I cannot remain under the obloquy of a reproach from such lips as yours! The following is an authentic statement of what really took place. At the first representation, I led the attack in person not less than thirty-three times. We had three acclamations for hilarities, two thrilling movements, four renewals of applause, and two indefinite explosions. In fact to such an extent did we carry our applause, that the occupants of the stalls were scandalized, and cried out "*A la porte!*" My men were positively extenuated with fatigue, and even intimated to me that they could not again go through such an evening. Seeing such to be the case, I applied for the manuscript, and after having profoundly studied the piece, I was obliged to make up my mind for the second representation to certain curtailments in the service of my men. I, however, applied them only to MM. ——, and if the *ad interim* office I hold affords me the opportunity, I will make them ample amends. In such a situation as that which I have just depicted, I have only to request you to believe firmly in my profound admiration and respectful zeal; and I venture to entreat you to have some consideration for the difficulties which environ me.'

The allegation that in London theatrical artists and managers are obliged to endeavor to insure success by means of a similar in-

stitution, is strenuously denied. Although no public offices of the kind have yet been established in Germany, the artifice is extensively practised, to the perversion of the public judgment and the detriment of art.

CLARE, a maritime county in the province of Munster, Ireland, bounded N. by Galway and Galway Bay; E. and S. by the Shannon, and its expansion Lough Derg, separating it from Tipperary, Limerick, and Kerry; W. by the Atlantic. It lies between lat. 52° 32′ and 53° 7′ N., and long. 8° 25′ and 9° 58′ W. It is seventh in size of the Irish counties; length, 67 miles; greatest breadth, 38; average, 21; area, 1294 square miles—more than a half being arable, and a hundredth in wood. The surface is mostly hilly, with some mountains, bog, marsh, and rugged pasture. There is an undulating plain in the center, from north to south. On the east, lie the Inchiquin, Slieve Baughta, and Slieve Barnagh mountains, the highest being 1758 feet, with rich pastures between. The mountains on the west rise in Mount Callan to 1282 feet. In the south, along the rivers, are rich loamy pastures called corcasses. The coast-line is 140 miles along the sea, and 80 along the Shannon estuary. The sea-line is high and rocky, in parts precipitous, with many isles and fantastic detached rocks. For five miles at Moher, the coast rises 400 feet nearly perpendicular, and at another point 587 feet. The chief rivers are the Shannon (q. v.), and the Fergus, running south 27 miles through the middle plain, and by an estuary five miles broad. The county has about 100 small lakes. Carboniferous limestone is a prevailing formation in the county. The south-west third of the county forms part of the Munster coal-field, with beds of ironstone, and thin seams of coal and culm. C. has mines of lead, copper pyrites, and manganese; slate and flag quarries; a black marble quarry near Ennis; and many chalybeate springs. The soils are warm and friable on limestone, deep rich loam on the Shannon, and cold and wet, with bogs and much timber on the coal tracts. Part of the limestone district is flooded in winter, but affords rich pasture in the summer, when the water dries up. In some places, spring-water is very scarce, and water can only be procured from the neighboring corcasses. The climate is moist and mild, but with frequent violent gales from the Atlantic. In 1880, 141,302 acres were under crops, the chief crops being oats, potatoes, wheat, barley, and turnips. The chief trade is in grain and provisions. Fine sheep and cattle are reared on the pastures. Fish are caught on the rivers in the native wicker-boats. The chief manufactures are coarse linens, hosiery, flannels, and friezes. C. is divided into 11 baronies, 80 parishes, and 7 poor-law unions, with parts of 3 others. The chief towns are Ennis (the county town) Kilrush, Ennistymon, and Killaloe. Pop. in 1841, 286,394; in 1851, 212,428; in 1871, 147,864, of whom 144,440 were Roman Catholics, 3027 Protestant Episcopalians, 220 Presbyterians; pop. in 1881, 141,457. In 1881, C. had 32,130 pupils on the rolls of the National Schools. It returns three members to parliament, two for the county, and one for Ennis. C. has many cromlechs, raths, remains of abbeys, and old castles or towers, and several round towers, one at Kilrush being 120 feet high. C., till the time of Elizabeth, was called Thomond. An adventurer called Clare gave it its present name.

CLARE COLLEGE, Cambridge, founded 1326 under the name of University Hall, by Richard Badew, was burned in 1338, and rebuilt and endowed by Elizabeth, Countess of Clare. Chaucer calls this college 'Solere' Hall. It has a master, 8 senior, and 10 junior fellows. The 18 fellowships are open to gentlemen of the degree B.A. or a higher, without restriction as to marriage. The master is elected by the senior and junior fellows. The buildings, which are in the Renaissance style, are amongst the most pleasing in the university. Richard III., pretending himself to be descended from the foundress, claimed the patronage of this Hall. The chapel was built in 1535, previous to which an aisle of St. Edward's Church, where the masters and fellows were anciently interred, was used for the purpose.

CLARE ISLAND, an island of Ireland, belonging to the county of Mayo, situated in the Atlantic, at the entrance of Clew Bay. It has a length of 4½ miles, with a breadth of 2 miles. On its north-east extremity, there is a light-house at an elevation of 487 feet above the sea. Lat. 53° 49′ 30″ N., long. 9° 55′ 30″ W.

CLA'REMONT, a mansion or country-seat at Esher, Surrey, built by a noble family of that name. When the Princess Charlotte, heiress-apparent to the crown of England, was married to Prince Leopold of Saxe-Coburg, C. was assigned as their residence; and at the death of the princess in 1817, the use of it was continued to the widower for life, along with the allowance settled on him of £50,000. The prince lived here till his election as king of Belgium, after which time he only occasionally visited it. After the revolution of February 1848, he placed it at the disposal of his father-in-law, ex-king Louis Philippe, who inhabited it till his death in August 1850. At the death of King Leopold in 1865, an Act was passed granting it to the Queen for life, after which it was to revert to the country. The Queen, in March 1882, bought the reversion of C., and it is now the residence of the Duke of Edinburgh.

CLA'RENCIEUX, the first of the two provincial Kings-of-Arms, in England, the second being Norroy. The jurisdiction of C. extends to all England south of the Trent, that of Norroy (q. v.) comprehending the portion north of that river. C. is named after the Duke of Clarence, third son of King Edward III. It is his duty to visit his province, to survey the arms of all persons bearing coat-armor within it, to register descents and marriages, and to marshal the funerals of all persons who are not under the direction of *Garter*. He also grants arms within his province, with the approval of the Earl Marshal.

CLA'RENDON, Constitutions of, were laws made by a parliament, or rather by a general council of the nobility and prelates, held at Clarendon, a village in Wiltshire, in 1164, whereby King Henry II. checked the power of the church, and greatly narrowed the total exemption which the clergy had claimed from the jurisdiction of the secular magistrate. These famous ordinances, 16 in number, defined the limits of the patronage, as well as of the jurisdiction, of the pope in England, and provided that the crown should be entitled to interfere in the election to all vacant offices and dignities in the church. The constitutions were unanimously adopted, and Becket, the primate, reluctantly signed them, at the solicitation of his brethren. But they were at once rejected by Pope Alexander III., when sent to him for ratification, and Becket thereupon immediately retracted his consent, and imposed upon himself the severest penances for his weakness in giving it. This, and the other measures adopted by the haughty and imperious archbishop, to vindicate the independence of his order, led to the unhappy disputes between him and the monarch, which terminated in the famous tragedy at Canterbury commonly known as the *martyrdom* of St. Thomas-à-Becket, the canonization of the saint, and the pilgrimages to his tomb, which subsequently became an institution of the Roman Catholic Church. Notwithstanding the personal humiliation to which Henry submitted after Becket's death, most of the provisions of the constitutions of C. continued to be permanent gains to the civil power. A masterly and dispassionate appreciation of the constitutions of C. will be found in Dr. Pauli's *Geschichte v. England;* and in Professor Stubbs's *Select Charters illustrative of English Constitutional History* the text of the constitutions is given.

CLARENDON, Edward Hyde, Earl of, an English historian and statesman, son of a private gentleman, was born at Dinton, Wiltshire, 18th February, 1608, and educated at Oxford. He studied law under his uncle, Nicholas Hyde, Chief-justice of the King's Bench; was a member of the Long Parliament, and for some time spoke and voted on the side of the popular party; but on the breaking out of the civil wars in England, he attached himself to the royal cause, and in 1642 was appointed Chancellor of the Exchequer, knighted and sworn of the privy council. Accompanying Prince Charles (Charles II.) to Jersey, he remained there for two years, and began his *History of the Rebellion* (London, 1702—1704; continuation, with Life, 1759), and also wrote the various papers which appeared in the king's name, as answers to the manifestoes of the parliament, and which far surpassed in vigor and elegance the productions against which they were directed.

In May 1648, he went to Paris, and in November 1649, was sent on an unsuccessful mission for assistance from the Spanish court. He afterwards proceeded to the Hague, where, in 1657, Charles II. appointed him High Chancellor of England. At the Restoration, he was confirmed in that office, and elected chancellor of the university of Oxford. In November 1660, he was created Baron Hyde, and in April following, Viscount Cornbury, and Earl of Clarendon. In 1663, the Earl of Bristol accused him of high treason in the House of Lords; and though this charge failed, public indignation was excited against him by the ill success of the war with Holland, and the sale of Dunkirk to the French. The victim also of some court intrigues, he was deprived of his offices; and he secretly withdrew to Calais, whence he sent his Apology to the Lords; but this writing was ordered, by both Houses of parliament, to be burned by the common hangman. After living six years in exile, he died at Rouen, December 1674, and was buried in Westminster Abbey. His daughter, Anne Hyde, became the wife in 1759, of the Duke of York, afterwards James II. and was the mother of Anne and Mary, both queens of Great Britain.

C. was on the whole both well intentioned and wise. There can be no doubt that he loved his country sincerly, and was humanely and liberally disposed. He was too moderate for the troublous times in which he lived. Lacking enthusiasm, he failed to appreciate the position of the Puritans; and after a brief period spent in their service, he passed over to the camp of the Royalists, but was never a bigoted partisan. His firmness, however, was not equal to his sagacity, and hence arose the perplexities which ultimately occasioned his fall. C.'s private character was excellent

in an age when virtue was utterly unfashionable among noblemen.

CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, EARL OF, a distinguished English statesman, was born 12th January 1800. He was a descendant of Thomas Villiers, who, in 1752, married the heiress of the last Lord Clarendon of the Hyde family, and was, in 1756, made Baron Hyde, and in 1776, Earl of Clarendon. Having studied at Cambridge, he early entered the diplomatic service, and in 1833 was appointed to the then important post of ambassador at Madrid, where he acquired great influence, which he employed in establishing the government of Spain on a constitutional basis. On the death of his uncle, the third earl, without issue, in 1838, he succeeded to the title, and returned to England to take his seat in the Upper House. In 1840, he was appointed keeper of the Great Seal. When the Whig ministry was broken up in 1841, he became an active member of the opposition; but warmly supported Sir Robert Peel in his measures for the abolition of the corn-laws.

Under Lord John Russell's premiership, he became President of the Board of Trade in 1846, and the following year was appointed Lord-lieutenant of Ireland. He entered upon his duties in troublous times. The insurrectionary follies of Smith O'Brien and his coadjutors might have set the whole country in a blaze, but for the prompt and decisive measures which C. adopted, and which soon restored general tranquillity. At the same time, his tact and impartiality contributed to allay and reconcile the exasperations of the party. The severity of his proceedings against the Orangemen on occasion of disturbances in 1849, was made the subject of a formal accusation in the House of Lords; but C. made a convincing defence, and ministers declared their complete approval of his proceedings. When the Russell cabinet resigned in 1852, C. was replaced by the Earl of Eglinton; but on the formation of the Aberdeen ministry, he was intrusted with the seals of the Foreign Office. He held the same seals under Lord Palmerston from 1855 to 1858; resumed them in 1865; retired with his colleagues in 1866; and taking the same office once more in 1868; he retained it till he died in June 1870.

CLARENDON PRESS. See BOOK-TRADE. Vol. I., p. 765.

CLA'RET (Fr. *Clairet*), a term originally applied to wines of a light-red color, but which is now used in England as a general name for the red wines of Bordeaux (q. v.). The name as used in England is unknown in France.

CLARIFICA'TION is the process of clearing a fluid from a turbid condition, as in the case of Beer (q. v.), or in the action of gelatine in fining British wines. Natural waters containing much organic matter in mechanical suspension and in chemical solution, are clarified by the addition of a little alum, which is precipitated with the organic matter, and the water then becomes healthy and refreshing. Liquids are often clarified by straining through several layers of cloth; and the addition of cold water to hot coffee, &c., causes a deposit to be thrown down, which clears the solution. The use of the CLEARING NUT (q. v.), for clarifying water, is general in India.

CLA'RINET, or CLA'RIONET, a wind-instrument of the reed kind, invented by Joseph Christoph Denner, in Nürnberg, in 1690. Its tone is produced by a thin piece of Spanish reed nicely flattened, and tied, or otherwise fixed on the mouth-piece. On the body of the instrument there are holes and keys for the fingers of the performer, by which the notes are produced. In extent, fulness, and variety of tone, the clarinet is the most perfect of wind instruments. Its construction, however, does not admit of every key in music being played on the same instrument, for which reason clarinets of different pitch are used in orchestral music, viz., the C clarinet, which plays all the notes as they are written; the B flat clarinet, a whole tone below the C.; and the A clarinet, a minor third below the C. In military music, an E flat clarinet, a minor third above the C one, is much used.

CLA'RION, or CLA'RIN, a species of trumpet, more shrill in tone than the ordinary one, also the name of an organ-stop of four feet pitch.

CLARK, SIR JAMES, Bart., a distinguished physician, was born at Cullen, Banffshire, December 1788. He was educated at the grammar-school of Fordyce; and at King's College, Aberdeen, where he took the degree of M.A. He studied medicine at Edinburgh and London, and entered as a navy surgeon in 1809—a position he held until 1815. Taking his degree of M.D. in Edinburgh in 1817, he, after traveling on the continent, settled at Rome, where he practised as a physician for eight years. In 1826, he took up his residence in London, where he soon secured for himself a prominent place among the most eminent medical men of the time. On the accession of Queen Victoria to the throne, C., who for two years previously had acted as physician to the Duchess of Kent, was appointed physician in ordinary to her Majesty; and in that capacity he attended the Queen on most of her journeys to Scotland and the continent. He was created a baronet in 1838. Among the most important of C.'s contributions to medical science, is his work *On the Sanative Influence of Climate*, a subject upon which he was considered a high authority; and *A Treatise on Pulmonary Consumption*, in which he showed that this destructive malady is one of the general health, depending upon mal-assimilation of the food, and to be prevented, and in certain cases arrested, by a wise regulation of food, air, and exercise. He was among the first in his profession, along with Dr. Andrew Combe and Sir John Forbes, who demonstrated the importance of the study of the laws of health, in order to the salutary direction and control of morbid action in disease; and he did great public and professional good by inculcating attention to the powers of recovery inherent in all living organisms. C. edited the last edition of Dr. Combe's *Management of Infancy*. He died June 29, 1870.

CLARKE, ADAM, LL.D., an eminent minister and scholar of the Wesleyan Methodists, was born about 1762 in the north of Ireland. He studied at Kingswood, near Bristol, and at the age of twenty, became a preacher or evangelist, in which capacity he obtained a great name, and seems to have exercised a most beneficial influence. Although the office of a Wesleyan pastor is very unfavorable for the development of scholarly habits, C. contrived to find time for extensive study. His first work was a *Bibliographical Dictionary*, published in 1802. His attainments in oriental literature and biblical knowledge procured for him the degree of LL.D. from St. Andrews university. The Board of Commissioners on the Public Records selected him to edit Rymer's *Fœdera*. He also edited and abridged several other works, but the great work of his life was his edition of the Holy Scriptures in English, illustrated with a commentary and critical notes, into which were compressed all the results of his varied reading. The first volume appeared in 1810, the eighth and last in 1826. C. died August 26, 1832.

CLARKE, EDWARD DANIEL, known as a traveler and author was born at Willingdon, in Sussex, in 1769. He studied at Cambridge, and from 1790 to 1799 was employed as tutor and traveling-companion in several noblemen's families, and made the tour of Great Britain, France, Italy, Switzerland, and Germany. In 1799, he set out on an extensive tour with Mr. Cripps, a young man of fortune; they traversed Denmark, Norway, Sweden, Lapland, Finland, Russia, the country of the Don-Cossacks, Tartary, Asia Minor, Syria, Egypt, Greece, and did not return to England till 1802. In consequence of his donations to the university of Cambridge, C. received the degree of LL.D. In 1807, he began a course of lectures on mineralogy, and the university established a professorship of that science in his favor. He presented to the library of Cambridge a number of valuable marbles collected during his travels; among others, the colossal statue of the Eleusinian Ceres, on which he wrote a treatise in 1803. England is also indebted to him for the possession of the famous sarcophagus with the inscription in three languages. On this he wrote a treatise: *The Tomb of Alexander, a Dissertation on the Sarcophagus brought from Alexandria, and now in the British Museum* (Lond. 1805). His "Travels," of which the first volume was published in 1810, and the fifth in 1819, were received with extraordinary favor. An additional volume, containing his *Travels through Denmark, Sweden, Lapland, Norway, Finland, and Russia*, was published after his death (Lond. 1823). A complete edition of his travels appeared in 11 vols. (Lond. 1819—1824). The university of Cambridge purchased his Greek and oriental manuscripts, among which is the famous Codex of Plato, which C. discovered in the island of Patmos. C. died March 9, 1822.

CLARKE, DR. SAMUEL, an eminent philosopher and theologian, was born at Norwich, October 11, 1675, and educated at Cambridge. The system of Descartes at that time held almost universal sway; but this failing to satisfy his mind, he adopted the views of his contemporary and friend Newton. Along with philosophy, he pursued the study of theology and philology. He was some time chaplain to the Bishop of Norwich, a promoter of science; he afterwards became chaplain to Queen Anne, and in 1709 rector of St. James's. By his work on the Trinity (1712), in which he denied that that doctrine was held by the early church, he brought himself into considerable trouble. The convocation of bishops, who wished to avoid controversy, contented themselves with an explanation, anything but satisfactory, and a promise from C. to be silent for the future on that subject. His views were of the kind known as *Semi-Arian*. For the rest, C. was a vigorous antagonist of the freethinkers of his time; in opposition to Dodwell, he sought to demonstrate the immortality of the soul from the idea of an immaterial being. He died May 17, 1729.

His most famous work is, *Demonstration of the Being and Attributes of God* (Lond. 1705); connected with it in subject is his *Verity and Certitude of Natural and Revealed Religion* (Lond. 1705). At the instigation of the Princess of Wales, who was inclined to the doctrines of Leibnitz, C. entered into a keen correspondence with that philosopher on space and time, and their relations to God, on moral freedom, &c. This correspondence was published under

the title of *Collection of Papers which passed between Leibnitz and Clarke in the years* 1715 *and* 1716 (Lond. 1717). In his ethical disquisitions, he seeks to find a foundation for moral obligation in a peculiar principle, which he calls the *fitness of things*, or the relations of things established from eternity by God. He published a valuable edition of Cæsar (Lond. 1712); that of Homer (Lond. 1729—1746) was completed by his son. A collected edition of his philosophical works appeared in 4 vols., Lond. 1738—1742.

CLARKSON, THOMAS, an eminent philanthropist, the son of a clergyman, master of the Free Grammar-School at Wisbeach, Cambr., was born in that town, March 28, 1760. He studied at Cambridge University, and was led to become the promoter of the anti-slavery agitation in Great Britain by a Latin prize-essay which he wrote in 1785, on the question, 'Is it right to make slaves of others against their will?' An English translation, on being published, had an extensive circulation, and C. resolved to devote his life to a crusade against African slavery. Associations were formed, and, besides visiting the principal towns of England, and even going to Paris, in the cause, C. published numerous essays, pamphlets, and reports on the subject. Mr. Wilberforce, M.P., whose co-operation C. had secured, took the lead in the anti-slavery agitation, and in 1787 brought the subject before parliament. On March 25, 1807, the law for the suppression of the slave-trade passed the legislature, and C. subsequently wrote a *History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave-trade*, 2 vols. 8vo., 1808. On the formation of the Anti-slavery Society, in 1823, for the abolition of slavery in the West Indies, C. became one of its leading members, and saw the object of its efforts attained in 1833. He took an active part in other benevolent schemes, particularly in establishing institutions for seamen in seaport towns, similar to the Sailors' Homes. He was in deacon's orders in the Church of England, but manifested great liking for the Society of Friends, although he never joined them. He died September 26, 1846.

CLARY (*Salvia sclarea*), a plant of the same genus with Sage (q. v.), a native of Italy and other southern countries of Europe, and which has been cultivated in British gardens from a very early period for its aromatic and other properties. It is a biennial about 2 feet high, with clammy stem, large, heart-shaped, rough, and doubly crenate leaves, and whorls of pale-blue flowers in loose terminal spikes, with large colored bracteæ. The seed is generally sown in spring, and the plants flower in the second year. C. is antispasmodic and stimulating. It has an odor resembling that of Balsam of Tolu, and is used for seasoning soups, and in confectionary for flavoring. Its flowers are used for making a fermented wine, esteemed for its flavor.—A British species of *Salvia* (*S. Verbenaca*) is sometimes called Wild Clary.

CLA'SSICS. The term *classici* was originally applied to those citizens of Rome that belonged to the first and most influential of the six classes into which Servius Tullius divided the population. As early as the 2d c. after Christ, it is applied figuratively by Gellius to writers of the highest rank, and this mode of designation has since been very generally adopted both in literature and art Most nations have had at some one time a more than usual outburst of literature, and they usually styled this the Classical period of their literature, and its most distinguished writers their Classics. But as the great productions of the writers and artists of antiquity have continued to be looked upon by moderns as models of perfection, the word C. has come to designate, in a narrower sense, the best writers of Greece and Rome, and 'classical' to mean much the same as 'ancient.'

CLAUDE, ST. a town of France, in the department of Jura, romantically situated at the confluence of the Bienne and Tacon, 25 miles south of Lonse-le-Saulnier. The town originated in an abbey erected here in the 5th century. The abbey enjoyed extensive privileges, including a very oppressive one—viz., that a year's residence on the abbey-lands made a peasant a serf. Serfdom continued down to the Revolution. St. C. has a fine cathedral, and manufactures of cotton and paper; and musical-boxes, snuff-boxes, toys, and fancy articles of horn, bone, &c., are largely made. Pop. (1876) 6632.

CLAUDE LORRAINE (properly named CLAUDE GELÉE), a celebrated landscape-painter, was a native of Lorraine, and born in 1600. A relative, who traveled as a lace-dealer, took C., when still a boy, to Italy, but deserted him in Rome. However, he soon found employment in grinding colors, and doing other menial services for Agostino Tassi, a landscape-painter, from whom he gained some knowledge of art. He next studied under Godfrey Waals at Naples, and after some time spent in wandering through various portions of Europe, he finally settled at Rome in 1627. The demand for his pictures rapidly increased, and he received numerous commissions. C. died of gout in 1682.

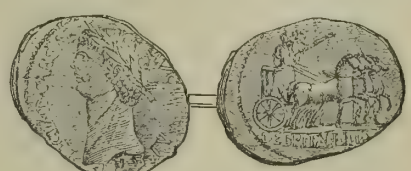
C.'s landscapes are found in the chief galleries of Italy, France, Spain, and Germany, and in particular England, which, according to Dr. Waagen, contains 54 paintings by Claude. Four of his best works—the landscapes known as 'Morning,' 'Noon,' 'Evening,' and 'Twilight'—are in the royal gallery at St. Petersburg. The painting on which C. himself set the highest value is the 'Villa Madama.' He kept it as a study, and refused to sell it, even when Pope Clement IX. offered for it as much gold coin as would cover the canvass. As C.'s paintings have always commanded high prices, many copies and imitations have been imposed on buyers. This was the case even during the artist's lifetime; for he set high prices on his works. In order to stop the fraudulent trade carried on in his name, he collected the sketches of his pictures in 6 books, to which he gave the title *Libri Veritatis*. They are now in the library of the Duke of Devonshire.

C. was an earnest, indefatigable student of nature, and possessed great invention. No one could paint with greater beauty, brilliancy, and truth the effects of sunlight at various hours of the day, of wind on foliage, the dewy moistness of morning shadows, or the magical blending of faint and ever-fainter hues in the far horizon of an Italian sky; but it has been affirmed—especially of late—that his conception is often artificial, conventional, and positively untrue, and it must certainly be admitted that his introduction of pseudo-Greek architecture into modern scenery is in the very worst taste. His figures are in general such inferior accessories, that he was wont to say he made no charge for them when he sold his pictures. In his private character, C. was amiable and very generous.

CLAUDET'S FOCI'METER, an instrument for ascertaining the coincidence or non-coincidence of the chemical and visual foci in portrait or landscape combinations of lenses. It consists of eight fans or equal segments of a circle, arranged spirally round a horizontal axis; they are white, and numbered from one to eight with black figures, and when in use, are so placed as to be all seen together from the lens. The method usually adopted in testing a lens is, to focus with great accuracy the fan numbered 4, and take a photograph of the instrument, in which, if No. 4 be the sharpest and best defined, it is a proof of the coincidence of the chemical with the visual focus; if, however, No. 3 should be sharper, the lens has been under-corrected; if No. 5, the lens has been over-corrected; in the former case, the lens must be turned more towards the ground glass, and in the latter further from the ground glass.

CLAUDIA'NUS, CLAUDIUS, a Latin poet of Alexandria, lived in the end of the 4th and beginning of the 5th century. He wrote first in Greek, which appears to have been his native tongue (though he was originally of Roman extraction); but, as Gibbon says, he 'assumed in his mature age the familiar use and absolute command of the Latin language; soared above the heads of his feeble contemporaries; and placed himself, after an interval of 300 years, among the poets of ancient Rome.' His poems brought him into such reputation, that, at the request of the senate, the Emperors Arcadius and Honorius erected a statue in honor of him in the forum of Trajan. The productions of C. that have come down to us, consist of two epic poems, *The Rape of Proserpine*, and the incomplete *Battle of the Giants;* besides Panegyrics on Honorius, Idyls, Epigrams, and occasional poems. C. displays a brilliant fancy, rich coloring, with variety and distinctness in his pictures; but he is often deficient in taste and gracefulness. A good edition of his works was published by Gesner (Leip. 1759), more recently by Doullay (Paris, 1836). An English translation was executed by A. Hawkins (London, 2 vols. 1817).

CLAU'DIUS I., TIBERIUS, a Roman emperor, the youngest son of Nero Claudius Drusus, step-son of the Emperor Augustus, was born at Lyon 10 B.C. He was naturally sickly and infirm, and his education was neglected, or left to be cared for by women



Coin of Claudius, representing his British triumph.
From the British Museum.

and freedmen. His supposed imbecility saved him from the cruelty of Caligula; but C., in his privacy, had made considerable progress in the study of history, and wrote in Latin and Greek several extensive works now lost. After the assassination of Caligula, C. was found by the soldiers in a corner of the palace, where, in dread, he had concealed himself. The prætorians carried him forth, proclaimed him emperor, and compelled his recognition by the senate and many citizens who had hoped to restore the republic. By his payment of the troops, who had raised him to the throne, C. gave the first example of the baneful practice which subjected Rome to a military despotism under the succeed-

ing emperors. The first acts of his reign seemed to give promise of mild and just government, but in the year 42, when a conspiracy against his life was detected, his timidity led him to yield himself entirely to the guidance of his infamous wife, Messalina, who, in concert with the freedmen Pallas and Narcissus, practised cruelties and extortions without restraint. C. meanwhile lived in retirement, partly occupied in studies, and expended enormous sums in building, especially in the famous Aqua Claudia (Claudian Aqueduct). This great work occupied 30,000 laborers during eleven years.

Abroad, the armies of C. were victorious Mauritania was made a Roman province, the conquest of Britain was commenced, and some progress was made in Germany. After the execution of Messalina, another woman equally vicious and more cruel, Agrippina (q. v.), married the emperor, and destroyed him by poison 54 A.D., in order to secure the succession of her son Nero. After his death, C. was deified.

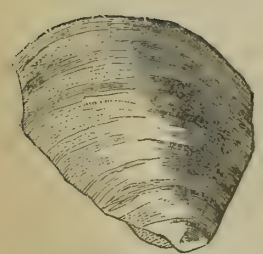
CLAUSE. See DEED.

CLAUSEL, BERTRAND, a French marshal, was born at Mirepoix, in the department of Ariège, December 1772, and entered the army at an early age. He commanded a brigade in the Italian campaign of 1799; was made a general of division of the Army of the North in 1802; and distinguished himself in the campaign of 1809 against Austria. The chief field of his fame, however, was Spain, where, after the battle of Salamanca, July 22, 1812, he succeeded Marmont in the command. He conducted the very difficult retreat from Portugal with the greatest circumspection, having to sustain a succession of battles. Although he had fought for Napoleon to the last, Louis XVIII., on his first restoration, named him inspector-general of infantry. When Napoleon again landed in France in 1815, C. immediately declared for him, was made a peer, and received the command of the Army of the Pyrenees. On the return of the Bourbons he was declared a traitor, but escaped to America; was condemned to death in his absence, but was subsequently permitted to return to France; and in 1830, after the July revolution, he received the command of the troops in Algeria, and made a successful expedition over the Atlas range into the province of Titeri, for which he was made marshal of France. Some misunderstanding, however, soon led to his recall; but he was again appointed governor-general of Algeria in 1835. After the disasters that befell the French arms before Constantine in 1836, and which were attributed in great part to him, he returned to France and defended himself—though not quite successfully—both from the press and the tribune, against the attacks made upon him. C. died at Secourrieu (Haute Garonne), 21st April 1842.

CLAU'SENBURG. See KLAUSENBURG.

CLAU'STHAL. See KLAUSTHAL.

CLAVAGE'LLA, or CLU'B-SHELL, a genus of Lamelli-



Clavagella Aperta:
External view of the Free Valve.

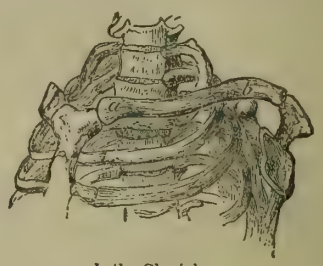
Clavagella Lata:
Showing the Cavity and Fixed Valve.

a, the fixed valve; *b*, the calcareous tube; *c*, a cavity communicating by a tubule with that of the clavagella.

branchiate Mollusks of the same family with Aspergillum (q. v.), of which fossil species were first known to naturalists, but existing species have also been discovered. These mollusks inhabit holes, which they excavate for themselves in rocks or in masses of coral, and the ordinary form of the bivalve shell is curiously modified; one valve being fixed to the inner surface of the chamber in which the animal lives, and the other free and capable of motion on its hinge within that chamber, whilst the shelly substance of the fixed valve is continued without interruption into a tube extending from the chamber outwards. The young mollusk is supposed to make its way into the rock by excavating this tube, but whether its excavations are accomplished by mere mechanical means, or by the aid of some chemical solvent, is still uncertain.—Fossil *Clavagellæ*, have not been found in any strata older than the supracretaceous group.

CLAVA'RIA, a genus of *Fungi* of the division *Hymenomycetes*, subdivision *Clavati*. The spores are produced equally on all parts of the surface. The species are numerous, some of them simple and club-shaped, some branched. Some are natives of Britain. *C. Botrytis*, a species common in oak and beech woods in Germany, growing on the ground, among moss, grass, heath, &c., is gathered when young, and used as food, having a very agreeable sweetish taste. It ceases to be edible when it becomes old. Another German species, *C. flava*, which grows on sandy ground in fir-woods, is used in the same way. Other species appear to possess similar properties, and Liebig found them to contain the saccharine substance called Mannite. *C. Botrytis* is the *Keulenpilz*, and *C. flava* the *Ziegenbart* (goat's-beard) of the Germans.

CLA'VICLE, or CO'LLAR-BONE, a bone which, in conjunction with the Scapula (q. v.) or Blade-bone, forms the shoulder. It derives its name from the Latin word *clavis*, in consequence of its resemblance to the key used by the Romans. As reference to the figure shows, it is placed horizontally at the upper and lateral part of the thorax, immediately above the first rib, and it articu-



ab, the Clavicle.

lates internally with the upper border of the Sternum (q. v.) or Breast-bone, and externally with the acromion process (or highest point) of the scapula.

Its chief office is to keep the shoulders well separated and steady, and to afford a fulcrum by which the muscles (the deltoid and great pectoral) are enabled to give lateral movement to the arm. Accordingly, it is absent in those animals in which the movement of the fore-limbs is only backwards and forwards (in one plane) for the purpose of progression, as in the Pachydermata, Ruminantia, and Solidungula; while it is present in all Quadrumana and in those of the Rodentia in which the anterior extremities are used for prehension as well as motion, as the rat, squirrel, and rabbit; and in the Cheiroptera and Insectivora, as the bat, mole, and hedgehog. In the mole it occurs in the form of a cube, being very short and broad, and of extreme strength. In many of the Carnivora (the cat, for example), the C. is present in the rudimentary form of a small bone suspended (like the hyoid bone in the neck) amongst muscles, and not connected either with the sternum or with the scapula. In Birds, where great resistance is required to counteract the tendency of the enormous pectoral muscles to approximate the shoulders, the clavicles are large and united at an angle in the median line (just above the anterior end of the sternum) into a single bone, anatomically known as the 'furculum,' but popularly recognized as 'the merry-thought.' (A lateral view of the furculum is given in the figure of the skeleton of the Golden Eagle in the article BIRDS.) In this class of animals, additional, and even more efficient, support to the anterior extremity is afforded by the extension of the coracoid process of the scapula into a broad thick bone called the 'coracoid bone' (q. v.), which extends to the sternum. It is unnecessary to trace the various modifications which this bone presents in Reptiles and certain Fishes.

In the human subject, the C. being exposed to the full force of blows or falls upon the shoulder, and not being easily dislocated (in consequence of its being well secured at both ends), is very frequently broken.

Ossification takes place in the C. earlier than in any other bone, commencing as early as the 30th day after conception, according to Beclard; and at birth it is ossified in nearly its whole extent. Mr. Humphrey (in his admirable *Treatise on the Human Skeleton*) suggests that the early ossification of this bone is a provision on the part of nature to prevent it from being fractured at birth in case of difficult labor.

Much important anatomical and physiological matter in connection with this bone will be found in Humphrey's work above cited, and in a memoir which he has recently published in the

Transactions of the Cambridge Philosophical Society; in Owen, *On the Nature of Limbs;* and in Struthers, *Osteological Memoirs, No.* 1, *The Clavicle.*

CLAVICO'RNÉS (Lat. club-horned), a great family of coleopterous insects, of the section *Pentamera,* distinguished by the club-shaped termination of the antennæ, which are longer than the maxillary palpi. Most of the beetles of this family feed on animal substances, and many of them, and particularly their larvæ, find their appropriate food in substances undergoing decay. It contains many genera, divided into groups (tribes), *Histeroides, Silphales, Dermestini,* &c. Burying Beetles and the Bacon Beetle may be mentioned as examples of it.

CLAVI'GERO, Francesco Saverio, a Mexican historian, was born in Vera Cruz, South America, about 1720, and entering the order of the Jesuits, was educated as an ecclesiastic. Sent as a missionary among the Indians in various parts of Mexico, he lived among them for 36 years, and made himself fully acquainted with the languages, traditions, and antiquities of the aboriginal tribes. On the suppression of the Jesuits in South America by Spain, in 1767, C. sailed for Italy, and with others of his brethren had the town of Cesena assigned to them by the pope as a place of residence, where he died October 1793. He wrote in Italian a *History of Mexico,* a comprehensive and valuable work, of which an English translation by C. Cullen was published in 1787, in 2 vols. 4 to.

CLAY (Ang.-Sax. *clæg;* of the same root as *clag, claggy*), a term applied, in a vague way, to those kinds of earth or soil which, when moist, have a notable degree of tenacity and plasticity. The clays are not easily distinguishable as mineral species, but they all appear to owe their origin to the decomposition of other minerals, and to consist chiefly of alumina in combination with silica and with a certain amount of water. See Alumina, Shale, Loam, Pipe-clay, Kaolin, &c. Common C., when, from the large proportion of alumina which it contains, it is sufficiently plastic, is of great use for making bricks (q. v.), tiles, &c.

C. is used by sculptors and others engaged in the production of works of plastic art, as a means of adjusting the form which is to be given to their work, in the harder or more enduring substance of which it is ultimately to be composed. As modelling C. is apt to crack in drying, it must be kept damp by sprinkling water over it, and covering it with a wet cloth when the artist is not engaged in his work.

Clay Soils derive their character from the alumina which they contain in a state of mixture, as well as in chemical combination with other substances. Some soils contain as large a proportion of alumina as 40 per cent., but generally the proportion is much smaller. The felspar which chiefly yields the alumina of clay soils contains also soda and potash, substances essential to vegetables, and which tend to render clays fertile when under cultivation. The physical characters, however, of the different varieties of clay soils arising from the varying proportions of silica, and other substances mixed with the alumina, are chiefly concerned in their relative fertility. Calcareous matter exercises a considerable influence on their powers of producing crops.

In Scotland, clay soils are chiefly found on the coal-measures, the boulder-clay, and as alluvium in the valleys. Those derived from the coal-measures are generally unkindly, being tenacious and difficult to labor. In the eastern counties, these are usually farmed on a five or six course shift, according to their quality. In the western, the moister climate is less suited for cultivating them to advantage, and dairy husbandry usually prevails where they are found under culture. The clay soils derived from the boulder-clays are also generally coarse and inferior in quality. The richest clay soils are found along the margins of the rivers, and go under the name of *carse* clays, which have already been described under that head. In the north of England, the aluminous shales of the coal-measures yield soils very similar in their properties to those in Scotland. England also abounds in clay soils derived from other geological formations. The chief of these are the London, plastic, weald, Gault, and blue lias clays.

The stubborn character of many of them is such that they are not suitable for tillage, but form excellent meadows and pastures. In the dry climate of Suffolk, strong clays are cultivated with great success on the four-course shift—1. Seeds, 2. Wheat, 3. Fallow or Roots, 4. Barley. Thorough drainage has greatly increased the value of clay soils under cultivation. Being so much sooner dry in spring, a longer period is obtained for preparing the land for putting in the crops. Weeds, too, are much more easily extirpated, and the strength of the soil is more entirely directed towards the raising of the crops. Wheat, beans, and clover are the crops which clay soils carry in the greatest perfection.. Clay soils have been long known to be retentive of moisture as well as of manure. Recent chemical investigations have shown, that clay soils have remarkable powers for absorbing ammonia, potash, and other substances, which constitute the food of plants. This property, it is now pretty well ascertained, arises from surface attraction.

CLAY, Cassius M., a zealous abolitionist, born in Kentucky, 1810, graduated at Yale College, 1832, and three years after was elected to the legislature of his native state. C. opposed the annexation of Texas, 1844; started *The True American,* a vigorous anti-slavery paper, the following year; volunteered in the Mexican war, 1846; supported Mr. Lincoln in 1860; and in 1862 was appointed U. S. Minister to Russia, a post he held till 1869.

CLAY, Henry, an American statesman of some distinction, was born April 12, 1777, in Hanover county, Virginia. He early devoted himself to the law, and fixing his residence at Lexington, Kentucky, soon obtained a lucrative practice and political influence enough to be elected to the state legislature. In 1806 he was elected to Congress, and again in 1809 he was chosen senator for a term of two years. In 1811 he was sent to the House of Representatives, where he was immediately elected Speaker. A strong advocate of nationality, he denounced the claims put forth by England as to right of search; he was a strenuous supporter of the war with that country, and in consequence was sent, in 1814, as one of the commissioners to sign the treaty of peace at Ghent, where his acuteness secured for America some advantages. On his return, he exerted all his talents in favor of the independence of South America, and labored hard to eradicate all European influence from the American continent. C., however, is best known as the author of the famous 'Missouri Compromise,' restricting slavery to the states south of 36° 30′ N. lat.; and also for the compromise of 1850, known as C.'s 'Omnibus' measure. He died June 1852. C. had undoubted talents, but he was by no means a comprehensive statesman. He was by far too fertile in compromises to be the author of any measure conferring lasting benefit on his country. He was very popular during his lifetime, and was two or three times proposed for the presidency, an honor, however, which he never succeeded in obtaining.

CLAY'MORE (meaning 'the great sword'), the Gaelic name for a kind of sword at one time much used, but not so well known at present. It had a double-edged blade, about 43 inches long by 2 inches broad; its handle was often 12 inches long, and its weight 6 or 7 lbs.

CLAZO'MENÆ, one of the twelve cities of Ionia. It was originally built on the Hermæan Gulf, westward from Smyrna; but the inhabitants having, through fear of the Persians, fled to a neighboring islet, and Alexander the Great having connected the islet with the mainland by a dike, the city subsequently extended over the peninsula thus formed. It is now called Vurla.

CLEA'NTHES, a Stoic philosopher, born at Assos, in Troas, about 300 B.C. His poverty was such, that he had to work all night at drawing water, in order to obtain money for his support, and to pay his class-fee while attending the lectures of Zeno. For nineteen years he listened patiently to the great Stoic, and, on his death, succeeded him in his school. He died of voluntary starvation when about 80 years old. C. differed, it is said, from the other Stoics, in regarding the sun as the governing principle of the world; but none of his writings are extant except a *Hymn to Zeus,* one of the purest and noblest pieces of poetry in the Greek language. It is an admirable union of religious feeling and philosophic thought, and impresses us very strongly in favor of the author, who, from all we can learn, was a man of stern and serious character. The *Hymn to Zeus* was published in Greek and German by Cludius (Göttingen, 1786), and re-edited by Merzdorf (Leip. 1835).

CLEAR, Cape, a headland of Clear Island, the most southerly extremity of Ireland, and locally belonging to Cork county. Cape C. is elevated more than 400 feet above the sea, and has a lighthouse, lat. 51° 26′ N., long. 9° 29′ W., with a bright revolving light 455 feet above the water-level.

CLEARANCE, in the mercantile marine, is a permission from the custom-house officers, or the emigration officers, or both, for the departure of a ship from a port, denoting that all the formalities have been observed, and all dues, &c., paid. If a foreign vessel, she must also be certified by the consul of the nation to which she belongs. Hence the expression *cleared out,* in reference to the departure of a particular ship.

CLEA'RING-HOUSE, in Banking. The business facilities afforded by bankers to their customers in collecting their bills, cheques on other firms, and like obligations, early imposed the necessity for an organized form of interchange of such securities, which would at once save labor and curtail the amount of floating cash requisite to meet the settlements of the bankers if effected singly.

This was first done by the clerks, when out collecting from the different banking-houses, meeting daily at the counter of one of the houses for the purpose; but about 1775, the building in Lombard Street, known as the 'Clearing-house,' was set apart for it,

under the direction of a committee delegated by the different firms, and the immediate management of two paid inspectors. The arrangement of the establishment may be briefly described: From time to time during the day each firm transmits to the C. cheques and bills which are payable by other bankers for classification, taking account of the obligations coming against their firm, so that, at the close of the day, they are the better able to make up their private books. At 4 o'clock the accounts are closed; each bank has till 4.45 to decide whether it will honor the drafts upon it; and by half-past 5, the officials are able to learn that the several houses are agreed between themselves, who has to pay money and who has to receive, and how much, by making up an account of the form subjoined. It is made up as between the particular bank receiving it and the C. representing every other bank with whom the former may have had any business on the day in question:

GLYN.

Debtors.	Balance.		Balance.	Creditors.
280,000	20,000	Barclay		260,000
50,000	10,000	Bosanquet		40,000
110,000		Commercial	10,000	120,000
115,000	5,000	Currie		110,000
50,000	5,000	Fuller		45,000
100,000	10,000	Hanbury		90,000
110,000		Hankey	5,000	115,000
280,000		Jones	20,000	300,000
150,000		Lubbock	10,000	160,000
200,000		Masterman	15,000	215,000
50,000		Olding	5,000	55,000
65,000	5,000	Spooner		60,000
165,000	5,000	Union		160,000
	60,000		65,000	

The comparatively small balance thus exhibited, used to be settled by each banking-house which owed money sending down to the C. the amount, and paying it, not to the officials there, but to any clerk whose house claimed a balance. But now, to avoid the risk of handling such a large amount of bank-notes, it is settled by means of a species of cheque on the Bank of England appropriated to the purpose, called *transfer tickets*, signed by each banking-house, and certified by an inspector of the clearing-house. A white one is used when the bank has to pay a balance to the C., and a green one when it has to receive a balance from it. By this means, transactions to the amount of several millions daily are settled without the intervention of a bank-note; and the importance of the arrangement may be assumed from the fact, stated in evidence before the House of Commons, that before the connection of the London and Westiminster Bank with the C., they were obliged to keep in hand £150,000 in notes for negotiating their exchanges.

CLEARING-HOUSE, The Railway, is an association instituted to enable railway-companies in England and Scotland, to carry on, without interruption, the through traffic in passengers, animals, minerals, and goods passing over different lines of railways, and to afford to the traffic the same facilities as if the different lines had belonged to one company. The arrangements are called 'the clearing system,' and are conducted by a committee appointed by the directors of the companies who are parties to it. The business is carried on in a building in Seymour Street, London, adjoining the Euston Station. The association is regulated by act of parliament, 13 and 14 Vict. 33 (25th June 1850), called 'The Railway Clearing Act, 1850.' Any railway-company may apply for admission to the system, and, on being accepted becomes a party to it. The companies are each represented on the committee by a delegate. Ten delegates form a quorum. The committee holds stated meetings on the second Wednesday in March, June, September, and December in every year, and at such other times as may be found necessary. The accounts of the clearing-system, and the balances due to and from the several companies, are settled and adjusted by the secretary of the committee, with appeal to the committee, whose decision is final. The expenses are defrayed rateably by the companies. The clerks at stations of the various companies send abstracts of all traffic monthly. The collected passengers tickets are also sent monthly. Number-men are employed by the C., who attend at each railway junction, and watch the arrival and departure of every train passing the junction. They note the number of every carriage, horse-box, wagon, van, and sheet or wagon-cover on the train going beyond the parent line, and also all damaged stock, and make weekly returns. The destination of each wagon is also noted. The returns from the companies' stations, together with those of the number-men, enable the accounts to be made up at the C., and, after examination, the companies are debited and credited, as the case may be. A debtor and creditor account is sent from the C. monthly to each company, showing, on the one side, what the company has to receive from others as their proportion of through passenger-fares, through goods rates and mileage of carriages, wagons, and sheets, and, on the other side, what the company has to pay to others out of monies drawn by them. The balance is struck, and, if against the company, a remittance must be made. If the balance is on the passenger traffic or stock, it is due five days after the date of the C. advice. The other balances must be paid within 23 days. Interest at the rate of 7 per cent. per annum is charged on outstanding balances. The cost of maintaining the C. with its officers and numerous clerks and number-men, is apportioned amongst the respective companies—(1.) In proportion to the number of entries at the credit of each in the mileage account; (2.) In the ratio of the number of vehicles and sheets recorded by the number-men; and (3.) According to the time occupied on the accounts.

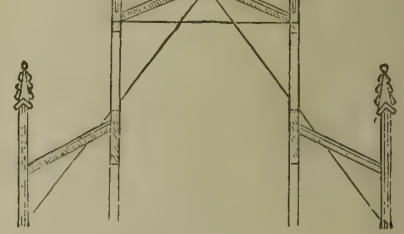
Regulations are published annually by the C. in January, for the guidance of the different companies in connection with the system. These determine the principles of classification of goods, division of rates, terminal allowances, payment for loss or damage of goods, and other points. A committee of general managers is appointed, whose duty it is to arbitrate on claims for damages to rolling-stock. A committee of goods' managers adjudicate cases of disputed liability which relate to goods' traffic. A committee of coaching superintendents perform a similar duty with reference to coaching or passenger traffic. The mileage of carriages is also regulated, being three-farthings per mile first class, and a half-penny for second. A varying rate for wagons and sheets is allowed according to distance, the charge for distances under 150 miles being about one half-penny for box-wagons, $\frac{2}{3}$ of a penny for open wagons, and $\frac{1}{3}$ of a penny for sheets. If carriages are detained beyond one clear day, demurrage is charged at the rate of 10*s.* per day for first-class carriages, and 6*s.* for second-class. If wagons are detained beyond two clear days, 3*s.* a day is charged. Sheets, after two days, are charged 6*d.* for the first day, and 1*s.* per day after. The terminal allowances are 8*s.* 6*d.* per ton in London, and 4*s.* in the country for carted goods; 1*s.* 6*d.* per ton when not carted.

The number of companies parties to the clearing-system was recently between 90 and 100, and the amount of business of an intricate kind which was involved may be judged of from the foregoing particulars. In short, the C. system of Great Britain is a vast organization, adapted, in an extraordinary degree, to save trouble in accounting, as well as to prevent petty disputes, among the individual companies concerned. The very circumstance of the great bulk of the used passenger-tickets in the kingdom being transmitted to a common center for adjustment as to the claims of one company against another, affords, in itself a remarkable instance of an ingenious system for elaborating simplicity out of what would almost appear a commercial chaos.—There is a similar railway C. system in Ireland, with its headquarters in Dublin.

CLEARING-NUT (*Strychnos potatorum*), a small tree of the same genus with the Nux Vomica (q. v.), abundant in the forests of India, and of which the seeds are much used for clearing water. They are sold for this use in the bazaars, and travelers commonly carry some with them. These seeds being rubbed on the inside of a vessel, muddy water put into it very quickly becomes clear, all impurities settling to the bottom. The tree has a deeply fissured bark; ovate, smooth, and pointed leaves; and a shining, black, pulpy fruit, with only one seed. The wood is very hard, and is used for various purposes.

CLEARNESS, a quality of art which is realized by a skilful arrangement of colors, tints, and tones. Where C. is to be obtained without sacrificing depth, a knowledge of *chiaroscuro* (q. v.) becomes indispensable.

CLEA'R-STORY, or CLERE-STORY. Originally this term was applied generally to the upper part of any building, which was lighted by several windows, or by a row of small windows or openings in the wall. Latterly, it came to be applied exclusively



Clear-story of Church.

to the upper part of the central aisle of a church, in which windows were found above the roof of the side aisles. The object of the C. in churches appears to have been to increase the light in the nave, but the windows in our existing churches are generally

so small as to effect this object very imperfectly. In many churches, the C. is a subsequent addition, and has often been added when the high-pitched roof, which indcluded the side aisles in its span, gave place to a flat one covering the nave only. The walls over the arches of the nave were then raised so as to receive the C. windows.

Cleat.

CLEATS, in Ship-building, are pieces of wood fastened to various parts of the vessel, and having holes or recesses for fastening ropes. There are several kinds, applied to various purposes, and bearing the names of *belaying*, *comb*, *mast*, *shroud*, *single*, *stop*, *thumb*, &c., cleats.

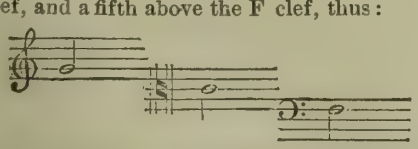
CLEAVAGE, or SLATY CLEAVAGE, is a condition of rocks in which they split easily into thin plates. The direction of these laminæ may be in the plane of stratification, but it much more frequently differs from it. C. is the result of an operation which is subsequent to, and entirely independent of, the original stratification of the rocks. It is impossible to determine what is the producing cause of this phenomenon. By some it has been considered to be due to crystalline agency, while others maintain that it arises from the pressure of mechanical forces at right angles to the planes of C., and yet others seek an explanation in a combination of these two agencies.

Professor Sedgwick, who has carefully examined the phenomena of C., has arrived at the following general results: 1. That the strike of the C. planes, when they were well developed, and passed through well-defined mountain-ridges, was nearly coincident with the strike of the beds; 2. That the dip of these planes (whether in quantity or direction) was not regulated by the dip of the beds, inasmuch as the C. planes would often remain unchanged while they passed through beds that changed their prevailing dip, or were contorted; 3. That where the features of the country or the strike of the beds was ill defined, the state of the C. became also ill defined, so as sometimes to be inclined to the strike of the beds at a considerable angle; 4. Lastly, that in all cases where the C. planes were well developed among the finer slate-rocks, they had produced a new arrangement of the minutest particles of the beds through which they pass.

C. though generally confined to clay-slate, yet occasionally occurs in lime and sandstone; but in proportion as the rocks are coarse, the C. planes become fainter and wider apart. In the fine-grained clay-slate, on the other hand, the laminæ are thin, smooth, and parallel; and as C. is always accompanied with more or less induration in the rock where it exists, clay-slate, thus altered, is of great economic value for roofing.

CLEAVERS, or GOOSE-GRASS (*Galium Aparine*), a species of Bedstraw (q. v.), a coarse annual, with whorls of 6—8 leaves, both stem and leaves rough with reflexed bristles, the fruit also hispid, and when ripe, very ready to adhere to any passenger who may brush against it; a very common weed in hedges and bushy places in Britain and most parts of Europe; but which has, from time to time, been brought into notice as possessing a remarkable specific power over some of the most formidable cutaneous diseases, including even lichen and leprosy, also over cancer. It is administered in the form of decoction or of extract. The whole subject of the properties of this herb seems to demand fuller examination.

CLEF, a musical character placed on the staff, by which the names of the notes are fixed. There are three kinds of clefs—viz., the G, the C, and the F clef. The G clef is placed on the second line, thus:  ; the C clef on the third line, thus:  ; and the F clef on the fourth line, thus:  . The C clef is a fifth below the G clef, and a fifth above the F clef, thus:



The C clef is also placed on the fourth line for some instruments, and for the tenor part in vocal music, thus:  ; and in old vocal music, the C clef placed on the first line was used for the soprano.

CLEG, a name given to some insects of the dipterous family *Tabanidæ*, the females of which are extremely troublesome to horses, cattle, and human beings in summer, piercing their skins by means of a curious apparatus of small lancets with which the mouth is furnished, and drinking their blood. The name C. is sometimes given in England to *Chrysops cæcutiens*, a fly frequent in most parts of Europe, but rare in Scotland, and which not unfrequently inserts its proboscis through the sleeve, or some other part of the dress, and thus makes man himself the object of its attack. It is about one-third of an inch in length, mostly black, with yellow markings on the abdomen, and very large eyes of the most beautiful green and golden colors. The insect always called C. in Scotland, is *Hæmatopota pluvialis*—a rather smaller fly, mostly of a gray color, but also remarkable for its very large and beautiful eyes, which are greenish, with waved purplish-brown bands. In England, it is sometimes called the *Stout*.

Cleg (*Chrysops cæcutiens*).

CLE'MATIS (Gr. *clema*, the shoot of a vine), a genus of plants of the natural order *Ranunculaceæ*, having four colored sepals, no corolla, and for fruit numerous one-seeded achænia with long—generally feathery—awns. The species are pretty numerous, herbs or shrubs, generally with climbing stems, natives of very different climates, and much scattered over the world. They possess more or less active caustic properties. The long awns give the plants a beautiful appearance even in winter. The flowers of many species are also beautiful. *C. Vitalba*, the common TRAVELER'S JOY (fancifully so named because of its ornamental appearance by the wayside), is the only native of Britain. It is common in the south, but becomes rarer towards the north, and is scarcely found in Scotland. The twigs are capable of being made into baskets. It rapidly covers walls or unsightly objects. The fruit and leaves are acrid and vesicant, the leaves are used as a rubefacient in rheumatism; and those of other species are also employed in the same way.—A number of species are commonly cultivated in our gardens. *C. flammula*, a native of the south of Europe and north of Africa, with white flowers, which have a very strong honey-like smell, is the species known as Sweet Virgin's Bower.

Clematis Vitalba.

CLE'MENS, TITUS FLAVIUS, a celebrated father of the Christian Church, was born probably at Athens, and resided during the greater part of his life in Alexandria, whence the epithet *Alexandrinus*. He flourished at the close of the 2d and the beginning of the 3d century. In his earlier years, he devoted himself with great zeal to the study of philosophy. His love of knowledge induced him to visit Greece, Italy, Syria, Palestine, and other countries. It is not known at what precise period he was converted from heathenism; but it is certain that after coming to Egypt, and listening to the prelections of Pantænus, he joined the Alexandrine Church, and was made a presbyter. Afterwards he became assistant to his master, who held the office of *catechist*. In 202 A.D., the persecution of the Christians under Severus compelled him to flee to Palestine. He is supposed to have returned to Alexandria about 206, and in 211 succeeded Pantænus. The year of his death is differently stated; some writers think it probable he died 213 A.D.; others, as late as 220. His most distinguished pupil was Origen.

C. was a very fertile writer. The chief productions of his which have survived are the *Protrepticus*, *Pædagogus*, and *Stromata*—which together form one large work. The first is an exhortation to the heathen to abandon idolatry; the second, an exposition of Christian ethics; and the third, a collection of treatises and brief observations on Greek and Christian literature. They show that C., when he became a Christian, did not cease to be a philoso-

pher; instead of railing at science, he felt himself bound to make use of it, wherever it was helpful in the elucidation of the higher questions of religion. Among the Fathers, *Biblical criticism*, in the strict sense of the term, was unknown, and speculative philosophy was the only critical instrument in their possession. It is not to be wondered at, therefore if much that is fantastic and absurd is to be found in their writings. C. certainly displays no lack of uncritical errors; but it is equally certain that the introduction of philosophy into Christianity helped to preserve the church from lapsing into the narrowness and ceremonialism of Jewish worship. The impression which we gather from C.'s writings, is that he was a man of broad, earnest sympathies, sincere piety, and liberal views in regard to the purposes of God's providence. This catholicity of mind procured him the accusation of heresy, and lost him the title of saint. C. was also a writer of Christian hymns, one of which, addressed to the Redeemer, is preserved. His collective works were first published at Florence in 1550.

CLEMENS, or CLEMENT, is the name of 17 popes, few of whom require any special notice. See POPES. CLEMENS ROMANUS, probably the C. mentioned in the Epistle to the Philippians, is assumed as the first of the series. He is accounted one of the apostolic fathers. He is said to have died as bishop of the church in Rome, in the year 102. Of his two *Epistles to the Corinthians*, the first and longest is undoubtediy genuine. But the Apostolical Canons and Constitutions attributed to him are spurious, as well as the fabulous account of his journeys with the apostle Peter. This last has come down to us in two forms: one in Greek, divided into 19 Homilies, under the title of *Clementina;* the other, a Latin translation by Rufinus, entitled *Recognitiones Clementis*. The Epistles have been edited by Muralt (Zurich, 1848), the Homilies by Schwegler (Stutt. 1847), and the Recognitiones by Gersdorf, in his *Biblioth. Patr. Eccl.*, vol. i. (Leip. 1837).

CLEMENT XIV., GIOVANNI VINCENZO ANTONIO GANGANELLI, was born in 1705 at St. Arcangelo, near Rimini, where his father was a physician. At the age of 18, he entered the order of Minorites, and studied philosophy and theology, which he then successfully taught. His merits were appreciated by the keen-sighted Benedict XIV., who appointed him to the important post of counsellor to the Inquisition, and under Clement XIII. he was made a cardinal. On the death of Clement XIII., he succeeded to the papal chair, May 19, 1769. No pope had ever been elected under greater difficulties. The kings of Portugal, France, Spain, and Naples were at variance with C., chiefly on account of his support of the Jesuits; Venice wished to reform the religious orders without his interference; Poland was seeking to diminish his influence; the Romans themselves were discontented. C. first set about reconciling the monarchs; he sent a nuncio to Lisbon, suspended the bull *In Cœna Domini*, and entered into negotiations with Spain and France. After several years of negotiation, he issued, 1773, the famous brief *Dominus ac Redemptor noster*, suppressing 'for ever' the society of the Jesuits. The motive assigned in the brief is, 'regard to the peace of the church.' From this time his life was made miserable by constant fear, and his strength gradually gave way. He died of a scorbutic disease, September 22, 1774. C. was remarkable for liberality of mind, address as a statesman, sound learning, and mildness of character. He cherished the arts and sciences, and was the founder of the Clementine Museum, which, by the additions of Pius VI. and Pius VII., became the chief ornament of the Vatican.

CLEMENTI, MUZIO, one of the best of pianists and composers far the pianoforte, was born at Rome in 1750 or 1752. His skill on the pianoforte, when only 13 years of age, secured for him the notice of a Mr. Beckford, an English gentleman traveling in Italy, with whom C. went to England, and in whose family he remained for several years, studying the works of the great composers, and where he also acquired an extensive knowledge of literature. His 'Opera 2' (composed in his 18th year) is considered the model on which the whole modern pianoforte sonatas have been founded. After traveling on the continent for some time, he returned to England, where he obtained the highest reputation as a teacher. Pecuniary misfortunes induced him, in the year 1800, to commence business as a music-seller and manufacturer of pianofortes. He died in London, March 10, 1832. His compositions, mostly pianoforte sonatas, are full of pleasant melody, and arranged in masterly style. For students, his classical *Introduction to Pianoforte Playing*, and his last work, the *Gradus ad Parnassum*, have been highly recommended. His style of playing was brilliant, and in improvisation he excelled all his predecessors.

CLEOMEDES, a Greek writer on astronomy. Nothing is known regarding his life, nor the period when he flourished. His treatise is entitled *The Circular Theory of the Heavenly Bodies*, and is remarkable as containing, amid much error and ignorance, several truths of modern science—such as the spherical shape of the earth, the revolution of the moon about its axis, its revolution round the earth, &c. C.'s treatise was first printed in Latin by Geo. Valla (Ven. 1498); in Greek, by Conrad Neobarius (Par. 1529). The two latest editions are those of Janus Bake (Lugd. Bat. 1820) and C. C. T. Schmidt (Leip. 1832).

CLE'ON, a famous Athenian demagogue, who flourished during a part of the Peloponnesian war, was originally a tanner, but having a strong bias towards politics, he gradually abandoned his business and became the champion of popular 'rights.' He first became prominent in the discussion regarding the fate of the Mytilenæan prisoners, 427 B.C. C. advocated the massacre of the males, carried his point, and more than 2000 perished; the rest were saved through the remorse of the Athenians. In 425 B.C., along with Demosthenes, he commanded an expedition against the island of Sphacteria, which was garrisoned by the Lacedemonians, and, much to the surprise of every one, succeeded in reducing the place; but the whole merit of this deed is usually attributed to his colleague. C. himself, however, was highly elated with his success, and his countrymen, or, at least, many of them, appear to have fancied that he really possessed military genius, for in 422 B.C. he was sent to oppose Brasidas, the Spartan general, in Macedonia and Thrace. On his way thither, he took Torone, a town in which Brasidas had left a small garrison and afterwards Galepsus.

But the great design of the campaign was the capture of Amphipolis, where Brasidas was stationed. C. somewhat reluctantly advanced, and began to reconnoitre. While he was so doing, Brasidas made an unexpected sally, and in the battle which ensued both leaders were slain. The Athenian army, however, was defeated, and obliged to retreat. The general opinion of C. is not favorable. He is painted both by Thucydides and Aristophanes as an ignorant, vain, blustering, and cowardly *mobocrat*. Most modern historians have accepted this estimate of the man; but Grote, in his *History of Greece*, has thrown very considerable doubt on its truth, and has labored to show that he was the rough but resolute champion of the people, and that his character has been vilified and abused by Aristophanes, who was—there can be no doubt—violently aristocratic.

CLEOPA'TRA, the daughter of the Egyptian king, Ptolemy Auletes, was born 69 B.C., and, according to the will of her father, should have inherited the throne along with her brother, Ptolemy Dionysus, who was also her husband. Her claim, however, being opposed, Julius Cæsar came to Alexandria, 48 B.C., to interpose in the quarrel, and in the Alexandrian War, Ptolemy Dionysus fell, and C., who was now married to her younger brother, Ptolemy, a boy of eleven years, was established upon the throne of Egypt. She bore a son to Cæsar, who was named Cæsarion. On her visiting Rome, Cæsar received her with great magnificence, and placed her statue in the temple which he had built to Venus Genitrix. In the civil war, after Cæsar's assassination, C. at first hesitated which side to take. After the battle of Philippi, Antony summoned her to appear before him at Tarsus, in Cilicia, to give account of her conduct. C., who had in the meantime got quit of the youthful Ptolemy by poison, appeared in the character of Venus Anadyomene, and so fascinated Antony, that he ever afterwards remained devoted to her. They spent the winter, 41—40 B.C., in Alexandria, in revelry; and Antony, although he had in the meantime married Octavia, the sister of Octavianus, returned to the embraces of C., who met him at Laodicea, in Syria, 36 B.C., and accompanied him to the Euphrates. His general residence from this time was with her at Alexandria. He bestowed upon her and upon her children great estates, which, however, he had no right so to dispose of. Upon this and other accounts, he became the object of great detestation at Rome, and war was declared against C., Antony being now regarded as her general. At her instigation, he risked the great naval battle of Actium (q. v.); and when she fled with 60 ships, he forgot everything else, and hastened after her. When Octavianus appeared before Alexandria, C. entered into private negotiations with him for her own security, which treachery becoming known to Antony, he vowed revenge; but a report coming to him that she had committed suicide, he thought it impossible to survive her, and fell upon his sword. Mortally wounded, and learning that the report which he had heard was false, he caused himself to be carried into her presence, and died in her arms. Octavianus, by artifice, succeeded in making her his prisoner.

Failing to make any impression upon him, and finding that he spared her life only that she might grace his triumph at Rome, she took poison, or, as is said, killed herself by causing an asp to bite her arm. Her death took place in August, 30 B.C. Her body was buried beside that of Antony, and Octavia brought up the children whom she had born to Antony as if they had been her own.

CLEPSY'DRA, an ancient Greek musical instrument, described by Athenæus as having pipes which were made to produce a soft sound by the agitation of water forcing air into them. There were levers for admitting the water, thus forming a kind of hydraulic organ.

CLEPSYDRA (Gr. *klepto*, I conceal, *hydor*, water), an instrument for measuring time by the efflux of water through a small orifice. Two kinds have been in use—one wherein the fluid is simply allowed to escape through the orifice; the other, in which the uniformity of the flow is secured by maintaining the fluid at a constant level in the instrument. The first would, like a sand-glass, give only an accurate measure of the time occupied in the escape of the whole fluid: of a shorter time it would be an inaccurate measure, as the pressure under which the escape takes place at the commencement is greater than at any instant thereafter, and constantly diminishes with the height of the fluid column. In the second, the flow must be nearly uniform; and if the water be received into a uniform graduated tube as it escapes, we have a tolerably good clock. The rate of the flow, however, is affected by the temperature and barometric pressure. The C. is supposed to have been used among the Chaldeans. The Romans employed it extensively. The invention of the pendulum has superseded it in modern times.

CLERC, Jean Le, better known as Johannes Clericus, was born at Geneva, March 29, 1657, where his father was a clergyman. From an early period, he showed a particular aptitude for the study of ancient languages, and in this department he is still a conspicuous name. He also paid great attention to theology, and his numerous controversial writings brought him no mean reputation during his lifetime. Before he was twenty, C. had imbibed heterodox opinions in religion. In 1678, he went as tutor to Grenoble, where he remained for two years; in 1680, he returned to Geneva, and was appointed to the clerical office. All the while his objections to the accepted theology of the day had been growing: the works of Curcellæus and of Episcopius confirmed this antipathy, and now he appeared as Liberius de St. Amore, the writer of eleven Letters against the Errors of the Scholastic Theologians—in short, as the partisan of the Dutch Remonstrants. In the latter part of 1681, C. left Saumur, whither he had gone to perfect his French, and went to Grenoble, and thence to London, where he preached six months to the Savoy congregation. Finally, he was appointed Professor of Philosophy, Classical Literature, and Hebrew at the Remonstrant seminary of Amsterdam. He died 8th January 1736. C.'s writings are very numerous; but his greatest service to posterity was the publication of a quarterly, the *Bibliothèque Universelle et Historique* (1686—1693, 25 vols., in 8vo.), followed up by the *Bibliothèque Choisie* (1703—1713) and the *Bibliothèque Ancienne et Moderne* (1714—1727). Other works of C.'s are—*Harmonia Evangelica* (1700); *Traduction du Nouveau Testament avec des Notes* (1703); *Ars Critica* (3 vols., 1712—1730); and *Traité de l'Incrédulité* (1733). The first two are Socinian in their tendency. C.'s rationalism is still more manifest in a work entitled *Sentimens de quelques Théologiens de Hollande touchant l'Histoire Critique du Vieux Testament*, in which the special inspiration of the Scriptures is denied. His editions of several of the ancient classics prove both his learning and acumen.

CLE'RGY (Gr. *cleros*, a lot, an inheritance), a term very generally applied to the ministers of the Christian religion, in contradistinction to the *Laity* (q.v.). This use of the term is very ancient, and appears to have gradually become prevalent, as the ministers of religion more and more exclusively, instead of the members of the Christian Church equally, began to be regarded as God's 'heritage' and 'priesthood' (1 Pet. ii. 9, and v. 3), consecrated to him, and peculiarly his. The distinction between the C. and the laity became more marked through the multiplication of offices and titles among the C., the ascription to them of a place in the Christian Church similar to that of the priests and Levites in the Jewish Church, with peculiar rights and privileges, their assumption of a peculiar dress and official insignia, the growth of monastic institutions, and the introduction of celibacy. In harmony with the notions on which this distinction is founded, is that of an indelible or almost indelible character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility, or a sort of apostasy. These notions in their highest degree belong to the Church of Rome. In the Protestant churches, the distinction between C. and laity is much less wide; and although the same terms are often used, it is rather conventionally than in their full signification. The employment of official robes by the C. preceded their assumption of a peculiar ordinary dress, and is not so intimately connected with any peculiar pretensions. Among the privileges accorded to the C. by the Roman emperors, and in the middle ages, was exemption from civil offices; among the rights asserted by them, and which caused much dispute, was exemption from lay-jurisdiction, even in cases of felony. The C. were distinguished into the *higher C.* and the *lower C.*, the latter including janitors, acolytes, lectors, exorcists, &c. The term *Secular C.* is the designation of priests of the Church of Rome who are not of any religious order, but have the care of parishes. Monks who are in holy orders are designated *Regular Clergy*. See Benefit of Clergy.

CLERK, Ship's, is a civil officer on board a ship of war, under the immediate orders of the captain. He keeps all the captain's documents, which are very numerous; such as the ship's log, remarks on coasts and anchorages, the muster-book, &c.

CLERK, John, of Eldin, Mid-Lothian, Scotland, inventor of the modern British system of breaking the enemy's lines at sea, was the 6th son of Sir John Clerk of Penicuick, Bart. Though not a naval man, he studied deeply both the theory and practice of naval tactics, and in 1779 communicated to his friends a new manœuvre for 'breaking the enemy's line' in a naval battle. Visiting London the following year, he had some conferences on the subject with naval officers, among whom was Sir Charles Douglas, Lord Rodney's captain of the fleet in the memorable action of April 12, 1782, when the experiment was tried for the first time, and a decisive victory gained over the French. The principle was adopted by all British admirals, and led to many signal naval victories. In 1782, C. printed 50 copies of his *Essay on Naval Tactics*, for private distribution among his friends. It was reprinted and published in 1790; the 2d, 3d, and 4th parts were added in 1797; and the work was republished entire in 1804, with a preface explaining the origin of his discoveries. The manœuvre was claimed by Sir Howard Douglas for his father, Admiral Sir Charles Douglas, but C.'s right to it is indisputable. He died May 10, 1812.—His son, John Clerk (Lord Eldin), an eminent Scottish judge, born in April 1757, was educated for the profession of the law, and in 1785, was admitted advocate. Distinguished for great clearness of perception and admirable powers of reasoning, he had for many years the largest practice at the Scottish bar, and in 1823 was raised to the bench, when he assumed the judicial title of Lord Eldin. He possessed a quaint sarcastic humor, and a coarse but ready wit, which, with his lameness and other bodily peculiarities, rendered him one of the most remarkable Edinburgh characters of his time. He died in that city in June 1832.

CLERK, Parish, an official in the Church of England, who leads the responses in a congregation, and assists in the services of public worship, at funerals, &c., but is not in holy orders. There is usually one in each parish. In cathedrals and collegiate churches, there are several of these lay-clerks; and in some cases they form a corporate body, having a common estate, besides payments from the chapter. Before the Reformation, the duties were always discharged by clergymen.

CLERK TO THE SIGNET. See Writer to the Signet.

CLERMONT (in the middle ages, *Clarus Mons*, or *Clarimontium*) is the name of several towns in France. The most important is the capital of the department of Puy-de-Dôme, Clermont-Ferrand (the *Augustonemetum* of the Romans, in the country of the Arverni), which is finely situated on a gentle elevation between the rivers Bedat and Allier, at the foot of a range of extinct volcanoes, crowned by the peak of Puy-de-Dôme, about five miles distant from the town. It consists of the two towns of C. and Montferrand, upwards of a mile distant from one another, and connected by a fine avenue of trees. C. contains several remarkable buildings; the old Gothic cathedral, the Corn and Linen Hall, the Theater, and the Hôtel-dieu or Hospital. C. has several educational and scientific institutions, and a public library, in which are preserved some curious MSS. Pop. (1876) 37,074, who carry on the manufacture of linen, woollen, cloth, hosiery, paper, &c., and an extensive traffic in the produce of the district, and in the transit trade between Paris and the south of France. There are two mineral springs in the town, which are used for bathing. That of St. Alyre is most remarkable, having deposited in the course of ages an immense mass of limestone; and the deposit at one part forms over a rivulet a natural bridge 21 feet long. The whole district abounds in such springs. A multitude of Roman antiquities attest the Roman origin of the city. In the middle ages C. was the residence of the counts of the same name, and became the seat of one of the oldest bishoprics in France. Several ecclesiastical councils were held here, the most remarkable of which was that in 1095, at which the first Crusade was instituted by Urban II. A statue has been erected to Pascal, who was a native of Clermont.

CLERMONT-DE-LODEVE, a town in the department of Herault, 23 miles W.-N.-W. of Montpellier, agreeably situated on the declivity of a hill, crowned by the ruins of an old castle. It has extensive manufactures of woollen cloth. Pop. (1876) 5685.

CLE'RUS, a genus of insects of the order *Coleoptera*, section *Pentamera*, and of the great family or sub-section *Serricornes*. They are beautiful beetles, generally found on flowers, and often on those of umbelliferous plants, but their larvæ feed on the larvæ of different kinds of bees: those of *C. apiarius*—a rare insect in Britain, but common in some parts of Europe—on the larvæ of the hive-bee. It is about half an inch long, greenish, the wing-cases scarlet with purplish blue bands. How the larvæ of this and other insects should be able to carry on their ravages with impunity in a bee-hive, has never yet been satisfactorily explained.

CLE'VELAND (Cliff-land), a wild mountainous district, with some picturesque fertile valleys, forming the east part of the N. Riding of Yorkshire between Whitby and the Tees. Geologically it consists of inferior oolite, but the coast and west border are formed of lias. In the south the hills rise 1300 to 1850 feet. An extraordinary change has been wrought in the aspect of the country by a rich discovery of ironstone in the C. hills; since 1851, lonely hamlets have become populous towns. The ironstone is chiefly an argillaceous carbonate, inferior in quality to the ironstone of the coal measures. See MIDDLESBOROUGH.

CLEVELAND, next to Cincinnati the most commercial city in Ohio, stands on the south shore of Lake Erie, at the mouth of Cuyahoga, in lat. 41° 30′ N., and long 81° 47′ W. The harbor is one of the best on the coast; and has been rendered still more available by extending a pier on either side into deeper water. By means of this secure and commodious haven, C., with the aid of artificial works in both directions, has navigable communications with the Atlantic Ocean on the one hand, and with the head of Lake Superior on the other; while to the south it connects itself with the basin of the Mississippi and the Gulf of Mexico through a canal which enters the Ohio at Portsmouth, about 200 miles below Pittsburg. C. is also the terminus of railways converging from almost every quarter. With so many advantages in its favor, it could hardly fail to grow and prosper. It is celebrated for its ship-building, and is becoming rapidly more and more important for its manufactures. Among these are copper-smelting, iron-rolling, coal-oil refining, the making of iron from ore, nail manufactories, &c. In 1874, the imports and exports were valued at 1,876,108 dollars. C. was founded in 1796, but it does not appear to have attained anything like its present rate of progress before 1840. Between that year and 1850, the population increased from 6,071 to 17,034; in 1860, it was 43,147; in 1870, it was 92,829; and in 1880 it was 160,142. Many of the streets of C. are lined with trees, whence it is called 'Forest City.' C. has numerous public schools, colleges, public buildings, charitable institutions, 100 churches, 50 newspapers and periodicals, &c. Magnificent works were erected at the cost of about 800,000 dollars to supply the city with water from Lake Erie.

CLEVES (Ger. *Kleve*), a town of Rhenish Prussia, 48 miles north-west of Düsseldorf. It is situated on three gentle elevations, about 2½ miles from the Rhine, with which it communicates by canal, in the midst of a rich and beautiful country. It is divided into an upper and lower town, is well built in the Dutch fashion, and surroudned by walls. It has a fine old castle, partly-built on a commanding rock, in which Anne of Cleves, one of the wives of Henry VIII., was born, and which is now converted into public offices. In the collegiate church, which dates from the 14th c., are some good monuments to the counts of Cleves. C. has manufactures of woollen and cotton fabrics, silks, hosiery, tobacco, &c. Pop. (1880) 10,000. C. was anciently the capital of a duchy extending alongboth banks of the Rhine, and which passed by marriage to the reigning House of Prussia.

CLEW is a name given to the lower corner of square sails, and the aftermost lower corner of stay-sails. *Clew-lines* are the names of ropes for managing these corners; *clew-garnets* are only applied to the *courses*, or largest sails of a ship; and to *clew-up*, is to haul up the C. of a sail.

CLEW BAY, an inlet of the Atlantic, on the west coast of Mayo county, Ireland, 15 miles deep by 8 broad. Some of the mountains on the north rise 1200 to 2500 feet, but the land on the east is lower, and leads to Westport, Newport, and Castlebar. Old red sandstone, carboniferous limestone, and Cambrian strata form the shores of the bay, which are generally bold and rocky, but have many small harbors and fishing-stations. The upper part of the bay contains an archipelago, 300 fertile and cultivated islets. At the entrance of the bay is Clare Isle, 4½ by 2 miles, composed of old red sandstone and Cambrian rocks, and rising 1520 feet.

CLICHÉ (Fr.), the impression made by a die in melted tin, or other fusible metal. It is the proof of a medallist's or die-sinker's work, by which they judge of the effect, and ascertain the stage of progress which they have reached before the die is hardened. The same term is applied by the French to stereotype casts from wood-cuts.

CLICHY, a town of France, in the department of Seine, about four miles north-west of Paris, of which it forms a suburb. It has manufactures of white-lead and chemical products. Pop. 14,366.

CLI'CK-BEETLE, the proper name of many species of coleopterous insects of the tribe *Elaterides* (see ELATER), the parents of the destructive larvæ too well known to the farmers by the name of WIRE-WORMS (q. v.). They derive the name C. from the sound which they make when, being laid on their back on any hard substance, they regain their feet by a spring, in the manner characteristic of the tribe to w hich they belong. The British species are numerous, the largest not quite half an inch long; none of them brilliantly colored; all very similar in form, and rather elongated. SKIP-JACK is another popular name for them. The Striped C. (*Agriotes* [*Cataphagus* or *Elater*] *lineatus*) is the parent of a very destructive kind of wire-worm.

CLI'ENT. See AGENT AND CLIENT. See also PRINCIPAL AND AGENT, PATRON, COUNSEL.

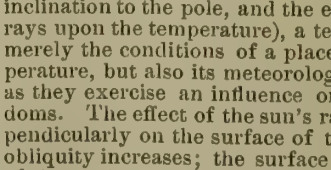
CLIFFORD, WILLIAM KINGDON, F.R.S., late Professor of Applied Mathematics and Mechanics at University College, London, and one of the foremost mathematicians of his time, was born at Exeter, May 4, 1845. He was educated at a school in his native town, at King's College, London, and at Trinity College, Cambridge. While at Trinity, he did not confine himself to examination subjects, but read largely in the great mathematical writers, and was second Wrangler in the Mathematical Tripos of 1867. At this time, while excelling in gymnastics, he would also solve and propound problems in the pages of the *Educational Times*, and could discuss with ease complicated theorems of solid geometry without the aid of paper or diagram.

A High-Churchman at first, C. before taking his degree threw off all his conventional restraints, and eagerly discussed some of the religious questions of the day. In August 1871 he was elected to the chair of Mathematics and Mechanics at University College, London, which post he retained until his untimely death at Madeira, March 3, 1879. C. first established his reputation as an original thinker with the faculty of expressing scientific thought in plain and simple language by a lecture at the Royal Institution, *On Some of the Conditions of Mental Development*. He was a valued member of the London Mathematical Society, contributing to the *Proceedings;* for a time he acted as Secretary, and afterwards Vice-president of the Mathematical and Physical section of the British Association; he also lectured to the Sunday Lecture Society on such subjects as *Ether*, *Atoms*, and *the Sun's Place in the Universe*. The versatility of his mind for philosophical and scientific discussion was further shown by his varied contributions to periodical literature. Besides these articles, he issued the first part of a larger text-book, *Elements of Dynamic* (1878). A selection from his *Mathematical Papers* appeared in 1881.—See Clifford's *Lectures and Essays*, edited by Stephen and Pollock, 1879.

CLI'FTON, a beautiful favorite watering-place in the south west of Gloucestershire, forming the western suburb and part of the parliamentary borough of Bristol. It is built on the sides and top of a carboniferous limestone hill, 308 feet high; commands fine picturesque views; and is separated from a similar cliff by a deep chasm on the south, through which flows the navigable Avon. The rock abounds in fossils and quartz or Bristol diamonds. It has a tepid spring of 73° F. which contains carbonic acid and salts of magnesia, and was brought into notice about 1695; but the former popularity of the spa has declined, and the pump-room has been destroyed. At the time of the great Lisbon earthquake, this water became red; and the Avon, which rises here 35 feet at high water, suddenly turned back. On Clifton Down are some remains of a Roman camp, 510 by 300 feet. An extensive camp is in good preservation on the opposite side of the gorge, with which C. is connected by a suspension bridge, 275 feet above low water, and 702 feet in span. C. College ranks among the best English schools. See BRISTOL.

CLIMA'CTERIC YEAR. It was long believed that certain years in the life of man had a peculiar significance to him, and were the critical points, as it were, of his health and fortunes. The mystical number 7 and its multiples (e. g., 35, 49) constituted crises of this kind. The most important of all was the 63d year, called, by way of eminence, the 'climacteric year' or 'grand-climacteric,' which was supposed to be fatal to most men; its influence being attributed to the fact, that it is the multiple of the two mystical numbers 7 and 9.

CLI'MATE (from the Greek *klima*, a slope or inclination, afterwards applied to a tract of country, with reference to its supposed inclination to the pole, and the effect of the obliquity of the sun's rays upon the temperature), a term now employed as including not merely the conditions of a place or country with regard to temperature, but also its meteorological conditons generally, in so far as they exercise an influence on the animal and vegetable kingdoms. The effect of the sun's rays is greatest where they fall perpendicularly on the surface of the earth, and diminishes as their obliquity increases; the surface which receives any given amount of the sun's rays increasing with their increased obliquity, as *a'b'* is greater than *ab* in the annexed figure; whilst at the same time the oblique rays being subjected to the influence of a greater number of particles of the atmosphere, as *c'a'* is longer than *ca*, a greater amount of their heat is absorbed before they reach the surface of the earth at all. The greater or smaller extent of surface receiving a certain amount of



heat, also makes important differences to arise from *exposure* by slope towards the equator or towards the nearest pole. *Elevation* is a most important cause of differences of climate. As we ascend from the level of the sea to the greatest mountain altitudes, even at the equator, the temperature gradually diminishes, owing to the diminished density of the atmosphere, and we reach a region of perpetual snow, as in approaching the poles. The progressive diminution of the temperature is, however, affected by many other causes, so that the line of perpetual snow is far from being at the same elevation in all places of the same latitude. Thus, the snow-line on the southern side of the Himalaya is depressed by the moisture of the aërial currents from the Indian Ocean; and that on the northern side is elevated by the radiation of heat in the vast dry table-lands of Central Asia, and the consequent ascending streams of warm dry air; so that the difference between the two is not less than 4000 feet in favor of the *northern* side of the mountain-ranges; and Humboldt says, 'millions of men of Tibetian origin occupy populous towns in a country where fields and towns would, during the whole year, have been buried in snow, if these table-lands had been less continuous and less extensive.' As the actual temperature of the atmosphere depends not so much upon the direct rays of the sun as upon the radiation from the heated surface of the earth, the diversities in the character of that surface are productive of great effects in modifying climate. A sandy desert, a tract of country clothed with luxuriant vegetation, and an expanse of water, absorb and radiate heat in very different degrees. A newly ploughed field both absorbs and radiates heat much more rapidly than a field covered with grass.

A sandy desert heats the atmosphere above it much more than either a fertile tract or a watery expanse, and a watery expanse still less than a fertile tract; but, on the other hand, the desert cools sooner by radiation; whilst the heat absorbed by the water being diffused through a larger mass—partly by reason of the motion continually taking place in the fluid substance—and affecting greater depths, the influence of the ocean, of seas, and of great lakes, is very powerful in maintaining a greater equality in the temperature of the atmosphere. Thus maritime places, and particularly islands and peninsulas, have a more equal temperature, with less diversity of the extremes of summer and winter, than more inland or continental places otherwise similarly situated. The effect of the sea is modified by many circumstances, and particularly by currents, of which the Gulf Stream (q. v.) affords a notable instance, the heated water conveyed by it from the equatorial to the polar regions having a great influence on the C., particularly of the north-west of Europe. The temperature of Europe is also in part dependent on the warm south winds, which have absorbed heat from the great sandy deserts of Africa; and over the world generally, atmospheric currents must be regarded as exercising even a greater influence on the C. than oceanic currents. The quantity of rain or snow that falls in the course of a year, and the times and manner of its falling, are circumstances which have a great effect on climate. These are circumstances much influenced by the distribution of land and water, and by the elevation and character of the surface of the land, which, doubtless, also influence electric and other meteorogical conditions, less understood, but certainly not unimportant.

The relations of C. to vegetation are determined not merely by the mean annual temperature, but in a great measure also—and, with regard to many plants, entirely—by the duration and C. of summer. Thus, maize, which may be mentioned as an important example, succeeds well in climates of which the winter-cold is severe, the summer season alone being sufficient for its whole life; whilst, on the other hand, such plants as fuchsias, some kinds of laurel, and even the common hawthorn, which succeed well enough where maize would scarcely put forth an ear, would perish from the colder winters of countries where it is profitably cultivated. The polar limit of particular species of animals, except those which hybernate, is generally determined by the decree of winter-cold which they can bear without injury.

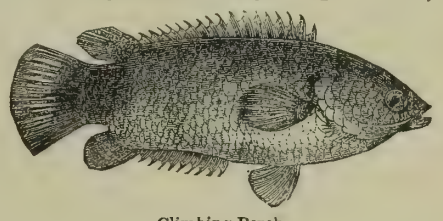
Bogs and marshes exercise an unfavorable influence on C., cooling the air and causing fogs, as clay-soils also to some extent do, through their retentiveness of moisture; whilst marshes of some kinds, and in some situations, abound in exhalations very unfavorable to health. Similar remarks apply to large tracts of forest. The clearing, drainage, and cultivation of land have generally favorable effects on C.; although plantations are often beneficial for shelter; and a too complete removal of natural forests may prevent the deposition of moisture from the atmosphere to such a degree as to cause droughts, a result strikingly exemplified in some of the smaller West India Islands, and the tendency to which is said to be manifested on the great scale in the eastern part of the continent of North America.

The important and difficult subject of C. will be found further elucidated in some of the principal geographical articles, and in the articles AGRICULTURE; ARBORICULTURE; ATMOSPHERE; METEOROLOGY; MONSOONS; RAIN; SEASONS; STORMS; TRADE-WINDS; WIND.

CLI'MAX, a Greek word signifying primarily a *stair*, and in Rhetoric, that artifice which consists in placing before the mind of the reader or hearer a series of propositions or objects so arranged that the least forcible strikes it first, and the others rise by successive gradations in impressiveness.

CLIMBERS (*Scansores*), in Ornithology, an order of birds generally characterized by having two toes before opposed by two toes behind, so as to adapt their feet in a remarkable degree for the purpose of grasping the branch of a tree or any similar object. Many have not two toes permanently directed backwards, but have the power of turning one of the front toes backwards at pleasure. Some have only three toes, but yet on other accounts are unhesitatingly ranked in this order. The families of the C., however, differ very much in many respects, although agreeing in the structure of their feet. To this order belong parrots, toucans, trogons, barbets, woodpeckers, and cuckoos. It has been objected to the name C., that although very descriptive of the habits of some birds of this order, as woodpeckers, it is not very applicable to others, as cuckoos, whilst there are birds of the other orders, as creepers, which possess this habit in the greatest degree; and the name has been changed by some ornithologists into *Yoke footed* or *Zygodactylous Birds*. It is generally the outer front toe which is directed backward in this order; but in the trogons, the first and second toes are opposed to the third and fourth.

CLIMBING PERCH (*Anabas scandens*), the only well-ascertained species of a genus of fishes, from which the family *Anabasidæ* (q. v.) derives its name. It is a native of rivers and ponds in most parts of the East Indies. It is about six inches long. In general form, it somewhat resembles a perch, and the resemblance is increased by the large scales and the spiny dorsal fin. That this fish climbs trees, has been asserted by observers whose veracity and accuracy cannot easily be questioned; yet others,



Climbing Perch.

who have enjoyed ample opportunity of observation, express great doubt concerning this habit. In climbing, the fish is said to suspend itself by its spiny gill-covers, and by fixing its anal fin in cavities of the bark, urging its way upwards by distending and contracting its body. There is no doubt that it often leaves pools when they are in danger of being dried up, and travels in search of water. Though these fish are sometimes compelled in their distress to travel by day, and have been met in the glare of noon toiling along a dusty road, their migrations are generally performed at night or in early morning, whilst the grass is still wet with dew. Climbing perches are plentiful in the Ganges, and the boatmen have been known to keep them for five or six days in an earthen pot without water, using daily what they wanted, and finding them as lively as when just caught.

CLIMBING PLANTS, or CLIMBERS, are, in the most extensive and popular sense of the term, those plants which, having weak stems, seek support from other objects, chiefly from other plants, in order to ascend from the ground. This, however, is accomplished in very different ways. Some climb by means of small root-like processes growing from the stem, as the ivy; some by means of *cirri* or tendrils, which twine round branches of trees, &c. (see CIRRUS); some by adhering disks, of which a beautiful instance is to be seen in the well-known Virginian Creeper; and many by the twining of their own stems around those to which they cling. Twining plants generally turn only in one direction, either from right to left, or from left to right. The scarlet-runner and passion-flower are examples of the former; the honeysuckle and hop of the latter. Twining plants are not always included under the designation climbing plants. The woody twining plants, which form one of the most remarkable features of tropical forests, are often called *Lianas* (q. v.).

CLI'NCHER-BUILT, or CLINKER-BUILT, is a name applied in Ship-building, when the lower edges of the side-planks overlap the row next under them, like slates on the roof of a house. If the planks are all smooth, meeting edge to edge, the construction is called *carvel-built*. This construction requires that the seams should be very close, and caulked with oakum. Boats are often *diagonal-built;* two layers of planking, rising in opposite directions from the keel at an angle of 45°. In iron ships, the clinker arrangement is called *lap-jointed;* and the carvel arrangement, *jump-jointed*.

CLI'NIC BA'PTISM (Gr. *kline*, a bed), in the ancient church, baptism administered to a person on a sick-bed or death-bed. The practice and the term alike indicate notions concerning baptism which have no foundation in Scripture, and which, although once extremely prevalent, have now almost entirely disappeared.

CLINIC ME'DICINE, is that department of the art which is occupied with the investigation of diseases at the bedside, or individually.

CLI'NKSTONE, or PHO'NOLITE, is a grayish green felspathic rock, remarkable for its tendency to lamination, which is sometimes such that it affords tiles for roofing. It is a compact homogeneous rock, passing gradually into gray basalt. The slabs give a metallic ring or 'clink' when struck with a hammer, whence its name. It occurs in volcanic districts.

CLINO'METER, an instrument for the purpose of taking the dip and strike of a stratum. It consists of a compass provided with a small spirit-level, and on the lid—which can be fixed at right angles to the compass-box—there is a small graduated quadrant, and a plumb-line.

CLI'NTON, DE WITT, an American statesman of English origin, son of a major-general in the United States army, and descended, on his mother's side, from the Dutch family of De Witt, was born in 1769, at Little Britain, state of New York. Being admitted to the bar, he became private secretary to his uncle, General George Clinton, till the end of his administration in 1785. In 1797, he was elected a member of the New York legislature, and in 1801, chosen a senator of the United States. Subsequently, he was elected mayor of New York, from which office the violence of political parties occasioned his retirement in 1815. Between 1817 and his death in 1828, he was repeatedly governor of New York state. The formation of the great canal trom Lake Erie to the Hudson was mainly owing to his persevering endeavors. He was a member of most of the literary and scientific institutions of the United States, and of several of those of Great Britain and the continent of Europe. Besides various fugitive pieces, his productions consist of speeches, governor's messsages, discourses before various institutions, addresses to the army, communications regarding Lake Erie Canal, and judicial opinions.

CLINTON, HENRY FYNES, a very distinguished classical scholar, was born January 14, 1781, at Gamston, in Nottinghamshire; educated at Southwell School, and afterwards at Westminster. In 1799, he went to Oxford, and in 1805 took his degree of M.A. Next year, he entered parliament as member for Aldborough, which he continued to represent until 1826. He died October 24, 1852. C.'s two great works are the *Fasti Hellenici* (1824—1834), and *Fasti Romani* (1845—1850). They are known to all European scholars, and contain an immense store of learning.

CLI'O, in Grecian mythology, the daughter of Jupiter and Mnemosyne, the mother of Hyacinthus and Hymenæus. She was the Muse of History and Epic Poetry, and was represented as bearing a half-opened roll of a book.

CLIO, a genus of shell-less Pteropodous mollusks, of which one species, *C. borealis*, is extremely abundant in the Arctic seas, and constitutes a principal part of the food of whales, so that indeed the name *whale's food* is often given to it by whale-fishers. It is scarcely an inch long; the head is furnished with six retractile tentacula; the organs of locomotion are two delicate fins, attached

Clio Borealis

to the neck, and which in swimming are brought almost into contact, first above, then below. It is an active little creature, often coming for an instant to the surface of the water in calm weather, and then suddenly diving away into the depths. Myriads are seen together, and the water is sometimes so full of them, that a whale cannot open its mouth without engulfing them in great numbers. *C. australis* is almost as abundant in the southern seas as *C. borealis* in the northern.

CLIPPER, is a name familiarly given to a ship built expressly for speed. The requirements of trades in which the merchandise carried was of a perishable nature, and rendered a quick passage desirable, were probably among the first causes which directed scientific attention to the *lines* of vessels for the purpose of ascertaining the form adapted to offer least resistance to the water. For many years the fruit-clippers have been celebrated for their rapid passages; and the opium-clippers, and slavers, have attained an unenviable notoriety for speed. The modifications of the old form of vessel have been gradual, the desideratum aimed at being the combination of the greatest carrying capacity with the form best adapted for speed. Perhaps the most successful improvements have been those of the Aberdeen builders, the Americans, and Mr. Scott Russell. A C., as compared with an ordinary sailing-ship, is longer and narrower (though of late the tendency has been to increase the beam); very sharp at the bows, which are generally hollowed more or less below the water-line; gracefully fined away towards the stern, which is usually elliptical; and, altogether, presenting the contrast of the race-horse to the beast of burden.

Some of the C. ships now running from Liverpool to America and to Australia are among the most magnificent vessels in the

English Clipper.

world. The *Lightning*, during a voyage from Melbourne to Liverpool, ran 2550 English miles in one week, or at the rate of 15¼ miles an hour during the whole period. The Americans have fully done their part in introducing rapid C. ships, both for ocean and for river navigation, for steamers and for sailing-ships.

CLIPPING THE COIN. See COINING.

CLI'THEROE, a parliamentary and municipal borough in the west of Lancashire, on the left bank of the Ribble, 28 miles north of Manchester. It lies on a low eminence of carboniferous limestone, at the base of Pendle Hill, which is 1803 feet high. Pendle Forest is celebrated as the locality of the exploits of the Lancashire witches. The main street runs along the ridge of the eminence, and at its south end are the ruins of a castle, founded in the time of William Rufus by the Lacys. C. has printworks, cotton manufactures, and limekilns. It sends lime to all parts of the kingdom. About 5 miles west of C., lies Stonyhurst College, the principal seat of the Jesuits in England. Pop. (1881) of the parliamentary borough, 14,463. It returns one member to parliament.

CLIVE, ROBERT, LORD, Baron of Plassey, one of the greatest warrior-statesmen of whom England can boast, the founder of British supremacy in India, was born at Styche, in Shropshire, 1725. At school he exhibited little aptitute for learning, but was noted for his mischievous propensities and his fearless disposition. The monotony of a clerkship in the India Civil Service at Madras, where he arrived in 1744, had literally been the death of him; it was with great joy, therefore, that he abandoned the pen for the sword, when some three years after his arrival the troubles accumulating upon the English in India gave him an opportunity of doing so. C. had now found his true sphere. The bold, fearless character had now scope enough for its development; and the intellect which, chained to the desk, had seemed of the dullest and most commonplace kind, in the freedom of the field became at once quick, comprehensive, and original. When C. grasped the sword, English influence in India, was almost extinct; the French and their allies had scarcely left them even a material footing.

Yet in less than half-a-dozen years after C. had, in August 1751, with 200 English infantry and 300 sepoys, marched out of Fort St. David on his hazardous enterprise to attack Arcot, a city of 100,000 inhabitants, and garrisoned by 1200 or 1500 of Chunda Sahib's best troops, amply supplied with artillery, the decisive battle of Plassey had been fought, and English power established on the ruin of that of France and the native princes. The daring displayed in the capture of Arcot, and the intrepidity and fortitude exhibited in its defence by C. and his little band, reduced to 200 men, against an army of 10,000, was the foundation of England's subsequent greatness and glory in India. C.'s name henceforward was a tower of strength in India, where he was surnamed by the natives *Sabat Jung*, or 'the Daring in War.' Victory marched with him alike against native warriors, French, and Dutch. Unscrupulons as to his means, he would undoubtedly have found himself involved in many difficulties had not his questionable actions been invariably crowned, and thus—in the lax political notions of the time—justified, by success. Nothing re-

maining for him to do in India, he returned to England in 1760, and received the warm thanks of the Company and an Irish peerage from the government for his services. His wealth, arising from shares in various spoils, presents and grants of territory from native princes, was enormous. After his departure from India, the company's affairs, through the dishonesty of its servants, high and low, fell into a state of the greatest confusion, and C., in 1764, was chosen to set them right. He proved himself as competent an administrator as he was a warrior. Uncompromising and resolute, he bore down every opposition to his plans, all the more sternly that he found it in some cases assuming the form of threats. In less than 18 months, he had 'restored perfect order and discipline in both the civil and military services, and brought back prosperity to the well-nigh ruined finances of the Company.' He returned to England in 1767, and was received with the distinction to which his important services entitled him. But the energetic way in which he had righted matters in India, gave offence to those who suffered from the supression of dishonest practices, many of whom were not without considerable influence in the mother-country. This influence they employed to stir up ill-feeling against C.; and his proceedings in India were made the subject of animadversion in parliament in 1772, and in the following year, matter for the inquiry of a select parliamentary committee; who, however, failed to find that C. had acquired his great wealth by abuse of power, as his enemies had asserted. The form of acquittal, however, was not quite satisfactory to C., who never got over the disgrace implied in the trial; and ended his life by suicide, November 22, 1774. See Malleson's *Clive* (1882).

CLOA'CA. See the article BIRDS. A similar anatomical arrangement is found in one order of mammals, the monotremata (q. v.), in all reptiles, and in many fishes.

CLOACA MA'XIMA. This was a subterranean passage of vast extent, by which the whole, or a great part, of the fifth of ancient Rome was conveyed to the Tiber. Drains from the lower parts of the city around the Forum, and from the other valleys, were commenced by Tarquinius Priscus; but the construction of the C. M. is attributed by Livy to Tarquinius Superbus. Niebuhr is of opinion, that it was at first intended to drain the valley of the Forum; but it appears to have been subsequently extended, and connected with the smaller cloacæ. Running from the Forum past the temple of Vesta, it terminated at the Tiber, where the mouth of it is still visible. It consisted of three large arches, one within the other. The space enclosed by the innermost vault was upwards of 13 feet in width, and of a corresponding height. The arches were built of large blocks of stone, fixed together without cement, of the uniform size of rather more than 5 feet 5 inches long and 3 feet high. The species of stone used bears evidence to the antiquity of the construction, being the material which was employed in the most ancient public edifices. The sewer was kept in a state of efficiency by a continual stream of superfluous water from the aqueducts. Large portions of this and of the other cloacæ remain, in some places still visible, but generally buried, by the accumulation of soil, at a considerable depth below the present level of the streets. During the Republic, the surveillance of the Roman cloacæ was one of the duties performed by the censors. The C. M. was subjected to repair by Cato and his colleague in the censorship. Agrippa, when ædile, obtained praise for his exertions in cleansing and repairing the cloacæ, and is recorded to have passed through them in a boat. Under the empire, officers called *curatores cloacarum urbis* were appointed for their supervision. So thoroughly was the city undermined by these large sewers, that Pliny calls it *urbs pensilis*, a city suspended in the air rather than resting upon the earth. Drains of the same description, but of smaller dimensions, existed in some others of the ancient Roman cities.

CLOCK BE'LL-METAL is principally an alloy of copper and tin, with smaller quanties of bismuth, antimony, lead, and zinc. A common alloy is 80 parts of copper, 10 tin, 5¼ zinc, and 4½ lead. The bismuth and antimony make the bell more brittle, but they communicate a better tone; and where the proportion of tin rises as high as 20 per cent., or 1 part of tin to 4 of the other metals, a very much more sonorous bell is obtained.

CLOCKS. See HOROLOGY.

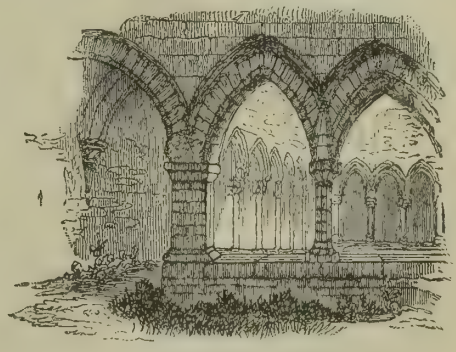
CLOGHEE'N, a town in the south-west of Tipperary county, 14 miles west-south-west of Clonmel, in lat. 52° 17′ N., and long. 7° 57′ W. Pop. (1881) 2924. The rich limestone soil of Tar vale produces fine wheat crops, and there are extensive flour-mills here. Six miles north-west of C. are the famous limestone caves of Mitchellstown, with beautiful limestone concretions. The caves consist of galleries and vaults, 800 by 570 feet.

CLO'GHER, a decayed episcopal city of Ireland, in the south of Tyrone, on the Launy, a tributary of the Blackwater, 104 miles north-north-west of Dublin. The see is now united to that of Armagh. St. Patrick is said to have been the first bishop of C., in 444. Pop. (1871) 1515; (1881) 1397.

CLOG A'LMANAC, the name given in England to a primitive kind of calendar or almanac, called also a 'rim stock' and 'prime staff.' In Scandinavia it was called a 'Runic staff,' from the Runic characters used in its numerical notation. It was generally of wood (whence its name of 'clog,' *i. e.*, log or block), but was sometimes of brass, of bone, or of horn. When of wood, it was most commonly of box; but elm, fir, and oak, were also employed. 'This almanac'—says Dr. Plot, in his *Natural Histoto of Staffordshire*, written in 1686, when it was still in use among the common people of that county—'is usually a square piece of wood, containing three months on each of the four edges. The number of days in them are expressed by notches: the first day by a notch with a patulous stroke turned up from it, and every seventh by a large sized notch. Over against many of the notches are placed on the left hand several marks or symbols, denoting the golden number or cycle of the moon. The festivals are marked by symbols of the several saints issuing from the notches. Some are perfect, containing the dominical letters as well as the prime and marks for the feasts, engraven upon them, and such are our primestaves in the Museum at Oxford: others imperfect, having only the prime and the immovable feasts on them, and such are all those I met with in Staffordshire; which yet are of two knds also, some public, of a larger size, which hang commonly here at one end of the mantle-tree of their chimneys, for the use of the whole family; and others private, of a smaller size, which they carry in their pockets.' Examples of the C. A. may be seen in the British Museum (one cut apparently towards the end of the 17th c.); in the Ashmolean Museum, and the Bodleian Library, at Oxford; in St. John's College, Cambridge; and in the Cheetham Library, at Manchester. The Flemish antiquary, Gruter, delineates one at Rome, which he believes to have been used by the Goths and Vandals; but there is no reason to suppose that the C. A. was known to any European nation before its conversion to Christianity. It is described by the Swedish historian, Olaus Magnus, in the 16th c.; and by the Danish antiquary, Olaus Wormius, in the 17th c. It has been found in France and elsewhere. In Denmark it seems to have been generally flat, divided into six columns; but six-sided examples are not unfrequent. Some of the clog almanacs show a peculiar numerical notation. The first four digits are marked by dots; the fifth, by a sign like the Roman numeral V; the next four, by this sign and additional dots; and the tenth, by the sign +.

Clog Almanac for month of January.

CLOI'STER (Fr. *cloître*, *claustrum*, an enclosure), a covered passage, or ambulatory, running round the walls of certain portions of monastic and collegiate buildings. The C. usually surrounded, or ran along three sides of a quadrangular area, which



Cloister:—Kilconnel Abbey.

was called the *C. garth*. The roof of the C., which was often vaulted, was supported on the side next to the quadrangle by pillars and arches, which were frequently ornamentally combined like trifolial arches, and, like them, occupied by tracery. The upper portions of these arches above the mullions were often glazed; and sometimes latterly even the whole arches, so that they became a row of windows, as at Gloucester. Cloisters were used for exercise and recreation by the inmates of the religious houses. Occasionally, when wholly glazed, they had cells or stalls for study on the inner side; and very frequently a stone-bench may still be seen, which runs along the same side. Many of the larger monasteries had more cloisters than one; and so characteristic were they of the religious houses, that the term C.

came to be used in a general sense for the whole establishment, which is still the sense of the word *kloster* in German. See MONASTERY.

CLONAKI'LTY, a town in the south of Cork county, Ireland, at the head of a small inlet. 26 miles south-west of Cork. Its chief export is grain. Pop. (1871) 3568; (1881) 3676.

CLONES, a market town of Ireland, in the county of Monaghan, 12 miles west from the town of that name. It is situated on a rising ground on the high-road between Monaghan and Belturbet, and near the Ulster Canal, and is in general well built, and has some ancient remains, including the ruins of a monastery, dating, it is said, from the 5th c., and of a round tower. It has manufactures of linen, corn-mills, and a brewery, and is the seat of a poor-law union. Pop. (1881) 2216.

CLONME'L (Vale of Honey), a parliamentary and municipal borough in the south of Tipperary county, with a little in Waterford, on both banks of the Suir, and two islands, 14 miles south-south-east of Cashel. It chiefly stands on the Tipperary side of the Suir, and on one of the isles in the river. One of the bridges over the Suir has 20 arches. The main street is a mile long, and parallel to the river. Pop. in 1871, 10,112, of whom 8729 were Roman Catholics, 1119 Protestant Episcopalians; the population in 1881 was 10,112. C. returns one member to parliament. It has manufactures of cotton, and large flour-mills. The chief exports are agricultural produce and cattle. Barges of 20 to 50 tons ply on the Suir to Waterford. C. had formerly walls, of which one gate remains. In 1650, Cromwell besieged the town, and demolished the castle. C. gave birth to Sterne and Lady Blessington, and was the chief scene of O'Brien's attempted rising in 1848. Here Mr. Bianconi first established the cheap and rapid car traveling over the south-west of Ireland; and C. is now a great center for Irish tourists.

CLONTA'RF, a town of Ireland, in the county of Dublin, about 3 miles east-north-east of Dublin city. It is much frequented during the summer months for sea-bathing, and there are many handsome villas in the vicinity. C. is celebrated in history as the place where, in 1014, Brian Boroimhe (q. v.) won a great victory over the Danes. Pop. (1871) 3442; (1881) 4210.

CLOOTS, JEAN BAPTISTE, BARON, better known as Anacharsis Cloots, was perhaps the most singular of all the enthusiasts brought to the surface of society by the French Revolution. He was born near Cleves in 1755, and from his 11th year was educated in Paris. Through ardent study of the ancients, his imagination, naturally extravagant, became so heated with the political constitutions of Greece, that he undertook the mission of spreading the democracy of Sparta and Athens throughout the world; and with this view he traveled through most of the countries of Europe, under the name of Anacharsis, everywhere expending upon his philanthropic schemes large sums of his very considerable private fortune. The union of all nations in one family was the ultimate aim of all his cosmopolitan schemes. The breaking out of the French Revolution brought his enthusiasm to a head, as he saw in it the fulfilment of his dreams and plans.

He returned to Paris, constituted himself the 'orator or advocate of the human race,' and presented numerous petitions to the National Assembly. On the 19th of June 1790, he appeared at the bar of the Assembly at the head of a number of strangers, dressed in the costumes of different nations, as the representatives of the whole earth, and presented an address of thanks for the stand made against the tyrants of the world, and a request that all the strangers then in Paris should be made French citizens. As a member of the Constituent Assembly, he offered to raise a Prussian corps, to be called the Vandal Legion; proposed to lay a price on the head of the Duke of Brunswick; called the king of Prussia the Sardanapalus of the north; and eulogized Count Ankarstrom for having assassinated the king of Sweden. What is singular is, that these extravagances were received often with storms of applause. He called for the apotheosis of Gutenberg in the Pantheon, as the 'creator of the word,' and also for that of an apostate priest. On the occasion of the general armament of France, he deposited 12,000 francs on the altar of the country. In 1792 he was elected a member of the Convention, and continued to weary the house with his extravagant motions. He hated Christianity no less than royalty; declared himself the enemy of its founder; and, as an adherent of the worship of Reason, preached downright materialism. At the trial of Louis XVI., he gave his vote for death, 'in the name of the human race,' and took occasion at the same time to pass sentence on the king of Prussia. Some time after, on the motion of Robespierre, he was excluded from the Club of the Jacobins, on the ground that he was wealthy and a nobleman. Robespierre hated and feared the enthusiast; and when St. Just brought his impeachment against Herbert and his adherents, C. was involved in it, was condemned to death, and executed March 23,1794. He heard his sentence with the greatest composure, comforted the companions of his fate, and continued to preach materialism to his friend Herbert on the way to the place of execution. At the foot of the scaffold he requested that his turn might be last, in order that he might have time to establish a few more principles, while the heads of the others were falling. He then laid his head with equinimity on the block, after asserting his innocence, and protesting against his sentence, 'in the name of the human race.' He left a number of writings, all of the same extravagant character of which we may mention here *Certitude des Preuves du Mohammédisme* (Lond. 1780), *L'Orateur du Genre Humain* (1791), and *Base Constitutionnelle de la Republique du Genre Humain* (1793).

CLOSE, in Heraldry. When the wings of a bird are down and close to the body, it is described as Close. The term is used only with reference to birds addicted to flight, such as the eagle, falcon, &c. Of dunghill cocks, and other domestic fowls, it is understood that their wings are in this position. Barnacles, and bits for horses, are said to be *close* when they are not to be understood as extended.

CLO'SE-HAULED, in Seamanship, is the mode in which the sails are arranged, in order to make the ship move in a direction the nearest possible towards that point of the compass from which the wind blows. Fore and aft vessels, especially cutters, sail closer to the wind than square-rigged ones. Ships of some sizes and shapes can attain this result better than others; but it is a quality scarcely to be calculated beforehand.

CLO'SET, in Heraldry, the half of the bar (q. v.).

CLOTAIRE I. and II., kings of the Franks. See MEROVINGIANS.

CLO'THES-MOTH, a name common to a number of species of small moths of the genus *Tinea*, the larvæ or caterpillars of which are extremely destructive to woollen clothes, furs, stuffed quadrupeds and birds, &c. *Tinea destructor* is one of the most annoying of these insect pests. It is of a satiny buff color, the wings deflexed when at rest. The larva is about a quarter of an inch long, with only a few hairs, white, with a slate-colored line down the back, an ochreous head, and 16 legs. *T. tapezana* has the upper wings black at the base, the rest of the wing white. *T. sarcitella* is another very common species, of a silky gray color; the head, thorax, and base of the superior wings white; the wings folded flat on the back when at rest. The larva is covered with scattered hairs. These moths are most abundant in the warmer seasons of the year, but their larvæ carry on their destructive operations even during winter. Guided by instinct, the female moth lays her eggs where the larvæ may find their appropriate food, consisting of substances indigestible to almost every other creature; and the larvæ, being furnished with minute but strong and sharp jaws, not only begin to eat as soon as they are hatched, but to cut the fibres of the substances on which they feed into little bits, and to unite them by means of a glutinous silk of their own producing, so as to form for themselves cases, lined internally with silk; and in these they constantly abide, adding to them at the anterior end as their own increase of size requires, and also widening them, by slitting them down the middle, and mending them with additional materials. All this may be beautifully observed by transferring the same moth-larva to different pieces of flannel in succession, of different colors. The larva of *Tinea tapezana* works its way through woollen stuffs in an arched gallery, carrying its little case with it. *T. pellionella* makes similar tunnels in furs. *T. granella* is destructive to books as well as to grain. See CORN-MOTH. The best means of preventing the ravages of moths are perfect cleanliness, frequent inspection of articles, and their exposure to light and air. Spirit of turpentine is used for killing them; the vapor arising from a sponge dipped in this liquid is fatal to such as it sufficiently reaches; they are also killed by the heat of a brisk fire or of an oven.

CLOTHING, ARMY, is one of the departments of the British military system into which, within recent years, much change and improvement have been introduced.

In the time of Henry VIII., the soldiers' dress was principally white, with green or russet for special corps. In Queen Elizabeth's reign, a sum of 1*s.* 8*d.* was allowed weekly for each soldier's clothing. The uniform then consisted of a cassock of Kentish broad-cloth, a canvas doublet, kersey stockings, trousers of kersey broad-cloth, neat's leather shoes, and holland shirt. In 1678, an infantry soldier's dress was valued at £2, 13*s.*, and a dragoon's as high as £6, 10*s.* At one time, lords-lieutenant attended to the C. of the troops, each in his own county; but the duty was afterwards transferred to the state. Captains of companies clothed the men, stopped the money out of the pay, and made a profit on the transaction. The privilege afterwards passed to the colonels of regiments. The sum provided by the state every

year was for the 'effective' strength of the regiment; and any vacancies put an additional sum into the pockets of the colonel. From 1746 to 1855, soldiers' pay was debited with 'off-reckonings,' as a means of paying for the clothes supplied to the men. Under this system, the colonel received from the state so much money annually for clothing his regiment, and then contracted with wholesale tailors for a supply on the lowest terms. In 1854, just before a change was made in the system, the colonel's profit on the C. for a private in the line, was 15*s*. 3*d*. per man.

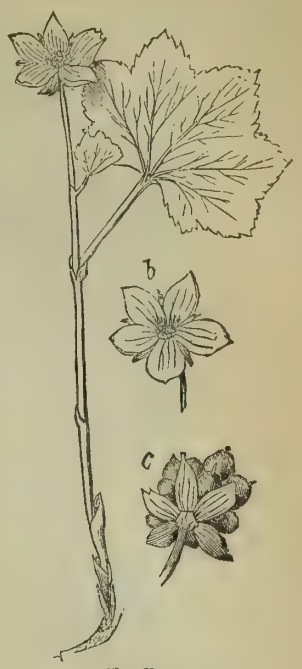
The disasters during the early months of the Crimean war having created a national demand for reforms in military matters, a change in the mode of army C. was one of the results. By a royal warrant, dated June 21, 1855, the colonels of regiments were awarded certain annual sums of money in lieu of off-reckonings. These sums varied from £1200 to £500, and were to be given in addition to the pay. From that date, all the troops have been clothed by the government, the off-reckonings being calculated nearly as before, but paid by the country to the colonels. When the War Office was remodelled about the same time, a clothing department was added to it; and it was now found that the C. for a full regiment of 1091 non-commissioned officers and rank and file, in the line, cost about £2500 per annum. The C. is now contracted for more openly than under the former system; and better materials are hence obtained without any increase in cost. The government has a factory on its own account, but a large part of the supply is obtained by contract. Formerly, soldiers' coats were too often made of very loose spongy materials; but now the inspection is rendered much more severe; and the cloth provided for privates is as good as that worn by sergeants a few years ago, while the cloth worn by sergeants now is correspondingly improved.

The net amount of the parliamentary vote for army clothing in 1881–82 was £780,000 (of which a proportionate part is repaid by the Indian government). The cost of a suit of uniform varies from £2, 15*s*. 4*d*. for a private in the line, to £8, 15*s*.. for a life-guardsman. The issue of new uniforms takes place on the 1st of April in each year. Under some circumstances, the men may receive money instead of C., at a certain price for each garment.

CLOTHING, Navy. The seaman of the royal navy are provided, while on the ship's books, with C. by the government; but a certain sum is subtracted from their pay, to defray the greater part of the cost. The navy estimates group 'victuals and clothing' together. The total vote under this head for the year 1881–82 amounted to £1,014,481, of which sum £262,606 was the amount allotted to thus provide for the fleet, the coast-guard service, &c. Cast-off seamen's C. is among the 'marine stores' sold by auction every year by the Admiralty. In 1859, when there was a strong desire to facilitate the manning of the navy, the Admirality offered improved terms to sailors who would enter the royal service; and among other items the following arrangements were made in reference to C.: 'To every man on his first entering the navy for ten years' continuous service, and to all boys on being advanced to man's rating, a suit of clothes consisting of the following made-up articles, to be furnished free of charge: A blue cloth jacket (No. 2 cloth), 17*s*. 8*d*.; a pair of blue cloth trousers, do., 11*s*. 7*d*.; a blue serge frock, 8*s*. 6d.; a duck frock, 2*s*. 9*d*.; a pair of duck trousers, 2*s*. 7*d*.; a black silk handkerchief, 2*s*. 10*d*.; and a pair of shoes, 6*s*. 7*d*. In the case of a seaman being already provided with clothes approved by his captain, a corresponding amount in money is to be placed to his credit.' The above figures will about show the market-value of the usual kinds of seamen's clothing.

CLO'THO, a genus of spiders, of which the only known species *C. quinquemaculata*, a native of the south of Europe and north of Africa—about half an inch long, long-legged, brown, with black abdomen, marked with five yellowish spots—is interesting on account of its habits and the sort of tent which it spins for itself. This curious structure is in shape like a limpet shell, about an inch in diameter, and is fastened to the under side of stones or in crevices of rocks, not by its whole circumference, but by seven or eight points only. Within this the eggs are deposited in several bags of lenticular form. The parent creeps in and out under the edges of her tent, and supplies the young with food for some time.

CLOUD, St., a town of France, in the department of Seine-et-Oise, situated on the declivity of a hill near the Seine, 5 miles west of Paris. Its present name is said to be a corruption of St. Clodoald, the name of a grandson of Clovis, who retreated to the little village of Novigentum, to escape the fury of his uncle, Clotaire, and became a monk. After his death, the village took the name of the pious prince, whose relics were sacredly preserved, and whose tomb was the scene of many miracles. St. C. figures often in the wars of the middle ages. Henry III. was assassinated here in 1589, by the fanatical monk Jacques Clement. St. C. was long famous on account of its magnificent château, built by Mazarin, and embellished by successive dukes of Orleans, who possessed it till 1782, when it passed into the hands of Marie Antoinette. Here Bonaparte, in 1799, was named First Consul; and in this place Charles X. signed the ordinances which produced the revolution of 1830. But during the siege of Paris, on the 13th October 1870, the château was set on fire and almost entirely destroyed by the French artillery from Mont Valerien; apparently because it was supposed to be the headquarters of the German staff. Pop. (1876) 4747.



Cloudberry:
b the flower; *c* the fruit.

CLOU'DBERRY (*Rubus Chamæmorus*), a plant of the same genus with the bramble, although of very different appearance, having a herbaceous single-flowered stem destitute of prickles. The plant is of humble growth, 8—10 inches in height; the leaves few, large, lobed, and somewhat kidney-shaped; the flower large and white, male and female flowers on separate plants, the female plant producing an orange-red fruit equal in size to a bramble-berry, and of an agreeable flavor. It is a native of the northern ports of Europe, Asia, and America. In Britain, it is chiefly confined to elevated moors; in Norway and Sweden, it is much more abundant, and the fruit is highly valued and made into excellent preserves. Unfortunately, the plant is of difficult cultivation, and no attempt to make it produce fruit freely in our gardens has yet been successful.—Somewhat similar to the C. is *Rubus geoides*, which yields a very agreeable fruit as large as a raspberry, one of the few native fruits of Terra del Fuego and the Falkland Islands.

CLOUDS are masses of fog, consisting of minute particles of water, often in a frozen state, floating in the atmosphere. When air saturated, or nearly so, with vapor, has its temperature lowered, either by ascending and becoming rarer, or by meeting a colder current, a portion of the vapor loses its gaseous form, and becomes condensed into minute specks of water. See Evaporation, Dew, Rain, Snow-line. A cloud, therefore, does not consist of vapor, in the proper sense of the word, but of water in the form of dust, as it were. How this water-dust is suspended in the atmosphere—why the particles do not descend as soon as formed, has never been satisfactorily explained. It has been assumed that the watery particles are hollow, like blown bubbles. But there is no proof of this; nor would the hollowness of the particles account for their floating, unless it could be shown that they must be filled with a gas lighter than the surrounding air. Professor G. G. Stokes holds that they are prevented from falling mainly by the friction and drag of the air-particles, just as fine powders remain suspended in liquids of much less specific gravity than themselves. But, as Sir J. Herschel says, rising and horizontal air-currents must also oppose the fall of C.; for at night, in the absence of rising currents, they often descend to, and dissolve in lower and warmer levels. The conditions under which C. are formed, and afterwards deposited in rain, are more fully considered under Evaporation, Dew, Rain, Snow-line. The present article is confined to a description of the various kinds of C., and of the weather they indicate.

A general haze of precipitated vapor covering the sky, and coming down to the earth, is termed a *Fog* or *Mist;* and the term Cloud is usually confined to masses of fog floating in the higher regions, and not descending to the ground. They are mostly within a mile of the earth's surface; and none are more than five or six miles above it. They rise higher in the equatorial regions than towards the poles. C. spread and move with the wind in varied, often grand forms; they are generally disposed in beds parallel to the earth's surface; vertical C. occur rarely, if at all.

Mr. Luke Howard's classification of C., proposed in 1802, into three primary forms—Cirrus (Ci.), Cumulus (Cu.), and Stratus (St); three intermediate—Cirro-cumulus (Ci.-cu.), Cirro-stratus (Ci.-st.), and Cumulo-stratus (Cu.-st.), and one compound form, Nimbus (Ni.)—has been universally adopted, and holds good in all climates and atmospheric conditions.

Cirrus, or curl cloud, consists of parallel, curling, flexuous, diverging, and partly straight fibres, increasing in any or in all directions by elongation, branching, or addition of new fibres. It is the highest and least dense of C.; forms at least three miles

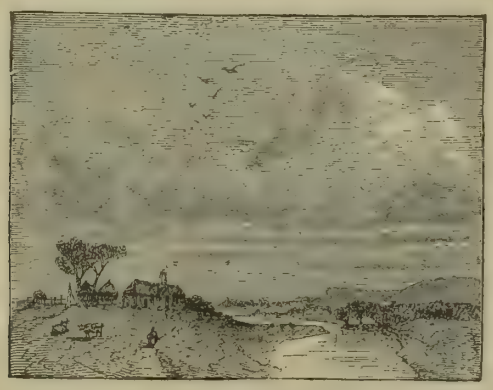
above the earth; varies most in extent, direction, and shape; retains longest its varied outlines; and is the longest illuminated after sunset and before sunrise.

It resembles a mare's or cat's tail, a lock of hair, fine trellis-work, or thin silvery streaks, and it may cover all the sky. Cirri seem to arise from the mixing of parallel air-currents, or are the relics of dissolving clouds drawn out in fibres by wind. Threads and groups of Ci., during gentle wind after severe weather, pre-

Cirrus.

sage serene settled weather. But after a long tract of fair days, whitish filaments or parallel bands of Ci. crossing the sky, with the ends converging by prospective in each horizon, and traveling longitudinally, though seemingly stationary, fortell a change to wet. Ci., being so high, must consist of minute snow crystals, whose refractions and reflections produce the halos, coronæ, and mock suns and moons almost restricted to this cloud and its derivatives the Ci.-st. and Ci-cu. The fibres often wave back and fore, or to and from each other. Ci., especially with fine tails, varying much in a few hours, presage rain or snow, and windy variable weather.

Cumulus, ball of cotton, day or summer cloud, consists of dense, convex, hemispherical, or conical heaps of small roundish C., piled or stacked on each other. The heaps enlarge upwards from a horizontal base, and have crenated tops; they sometimes unite into stupendous white-topped mountains. It forms, says Sir J. Herschel, in summer calms by the rise of columns of vapor from marshes, lakes, and rivers, into the colder and quickly saturable lower regions of the air; for one liquid traverses another in cylinders. Cumuli begin after sunrise as a few scattered specks in the clear sky; these specks enlarge and unite to form C., which often nearly cover the sky in the afternoon, and generally decrease and vanish about sunset; but rain follows if they increase in number and darkness in the evening. Their tops become Ci. in very dry air. Cu., of pleasing forms, dispositions, and colors, and of moderate size, presage fine dry warm and calm days; but cold, rain, and tempest follow dark, abrupt, dense, shaggy Cu., covering the sky, and rolling on each other. Hemispherical, silvery white Cu. presage thunder.



Cumulus.

Stratus, fall or night-cloud, the lowest of C., is a widely extended, horizontal sheet, of varied thickness, of white mist touching or near the earth. In density, it is between Ci. and Cu., and it increases from below. It is common in summer and autumn often from sunset to sunrise, and is densest at or after midnight. It arises in calm clear evenings, after warm days, from the cooling of moist air on damp ground, marshes, lakes, rivers, or from the cooling of moist air mixed with smoke enveloping great cities. From a height, it is seen spreading around like a sea, and creeping up hillsides. After sunrise, it rises from the ground, breaks up into Cu., and vanishes with the increasing heat, to be followed by a serene day; but it may quietly accumulate in layers, and become a Ni. It does not wet objects it touches, and thus differs from a variety of Ci.-st. of like external aspect.

Cirro-cumulus, or sonder-cloud, consists of Ci. sinking in the air, and compressed into dense roundish-white cloudlets, or woolly irregular tufts, generally at great heights. It often forms a beautiful sky in beds like flocks of sheep at rest. It is often seen through breaks in lower C. moving differently. It may vanish or pass into Ci. or Ci.-st. Solar and lunar coronæ appear in it. It occurs in warm dry weather, and between summer showers, and presages increased heat. Ci.-cu. very dense, round, and close, and with Cu.-st., presages a storm or thunder. In winter, it precedes a thaw and warm wet weather.

Cirro-stratus, or vane-cloud, consists of long, thin, horizontal clouds, with bent, or undulated edges. It often resembles shoals of fish, or has a barred appearance—the mackerel-backed sky. It alone, or with Ci.-cu., forbodes rain, snow, and storm. Waved Ci.-st. generally attends heat and thunder; it often forms an extended shallow bed or thin veil, through which the sun and moon shine faintly. This variety oftenest presents the finest solar and lunar halos, parhelias and paraselenes, and it is the surest prognostic of rain and snow.

Cumulo-stratus, or twain-cloud, is a Ci.-st. mixed with Cu. heaps, or a wide flat base surmounted by a bulky Cu., with fleecy protuberances or rocky and mountain masses. It resembles a thick-stemmed fungus, with a flat, anvil-shaped, or cirrose top. It is much denser than Cu., though the air is not dry enough to round off sharply its tops. It often forms vast banks of cloud, with over-

Stratus.

hanging masses. It is common towards night in dry windy weather, when it has a leaden hue. It generally arises from Cu. becoming denser, wider, and protruding in large irregular projections over the base. It tends to overspread the sky, and partly or wholly to become Ni., and fall in showers. Cu.-st. is intermediate between clouds indicating fair, and those indicating rough, rainy weather, and attends sudden atmospheric changes. Distinct Cu.-st. forms before thunder. Cu.-st. increases the grandeur of mountain scenery, and drops on and envelops mountain-tops like a curtain.

Nimbus, or Cumulo-cirro-stratus, the black rain-cloud, is a cloud or mixed system of clouds, ending in showers of rain, snow, or hail. It is a dense, continuous, horizontal black or gray sheet, with fringed edges, a cap of Ci., and Cu. on the sides and below. Before rain, vast towering masses of Cu. often pass into Cu.-st., which, increasing in density, darkness, irregularity, and extent, become Ni. capped by Ci.-st. Thunder-storms are always accompanied by Ni. in its most perfect form.

The term *scud* has been applied to loose vapory fragments of C. driven by wind, and *cumulonus* to shaggy cumuli.

The formation and height of C. vary with the quantity of vapor in the air, the course and height of air-currents, the climate, season, temperature, disposition, and extent of sea and land, and the height of land. Cloud-strata on the Pyrenees vary in average thickness from 1600 to 3400 feet. The lower surfaces of considerable masses of clouds in all climates are probably 2500 to 3000 feet above the earth. Remarkable cloud-rings prevail over the calm zones of the equator, and over those of Cancer and Capricorn. Clouds, viewed from above in bright sunshine by the aëronaut or mountaineer, appear as dense volumes of steam or masses of white cotton. Kaemtz regards the usual height of Ci. as 10,000 to 24,000 feet; Cu., 3000 to 10,000; Ni., 1500 to 5000; but Ci. may descend to 2000 or 3000 feet, and Ni. to within a few hundred feet of the earth.

C. moderate the sun's rays during day, and the earth's radiation during night. They always exhibit positive or negative electricity, but of greatest tension in thunder-storms. They are the

sources of the moisture required by plants; of the water of springs, lakes, and rivers; and of the polar, glacial, and winter snows, which cover temporarily or permanently parts of the earth.

In Britain, six or seven tenths of the sky is on an average daily obscured by clouds. There is most cloud in winter, and about mid-day, and least in May and June, and during night. Summer and autumn nights are freest of clouds. All the forms of C. may be seen in one day, often very much commingled.

CLOUDY BAY. See NEW ZEALAND.

CLOUTED or CLOTTED CREAM is obtained by heating milk in a shallow wide pan on a hot plate or over a slow charcoal-fire. The milk must be strained, as soon as it comes from the cow, into the pan, where it must stand for 24 hours before heating. It usually takes from half an hour to three-quarters of an hour to heat the milk completely; but it must not boil. It then stands for 24 hours, when the cream is skimmed off, and a little sugar thrown on the top. The result is C. C., which, mixed with new milk, is eaten with strawberries, raspberries, tarts, &c. Devonshire is famous for its clouted cream.

CLOVE BARK, another name for CULILAWAN BARK (q. v.). —Another bark which occurs in commerce under the name of C. B. is that of the *Myrtus caryophyllata*, a native of Ceylon and the Mascarene Isles. It is in sticks two feet long, formed of several pieces of very thin hard bark, rolled up one over the other, of a deep brown color, and of a taste similar to that of clove. It possesses properties analogous to those of cinnamon.

CLO'VER, or TR'EFOIL (*Trifolium*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, containing a great number of species, natives chiefly of temperate climates, abounding most of all in Europe, and some of them very important in agriculture as affording pasture and fodder for cattle. The name C. is indeed popularly extended to many plants not included in this genus, but belonging to the same natural order, and agreeing with it in having the leaves formed of three leaflets, particularly to those of them which are cultivated for the same purposes, and sometimes collectively receive from farmers the very incorrect designation of *artificial grasses*, in contradistinction to *natural grasses*, i. e., true grasses. See MEDICK and MELILOT. The true clovers (*Trifolium*) have herbaceous, not twining stems; roundish heads or oblong spikes of small flowers; the corolla remaining in a withered state till the ripening of the seed; the pod enclosed in the calyx; and containing one or two, rarely three or four seeds. About 17 species belong to the flora of Britain.

The most important of all to the British farmer is the COMMON RED C. (*T. pratense*), a native of Britain and of most parts of Europe, growing in meadows and pastures. It is perennial, but is generally treated as if it were a biennial. Its heads of flowers are oval or nearly globular, very compact, about an inch in diameter, purple, more rarely flesh-colored or white; the tube of the calyx is downy; the stipules run suddenly into a bristly point. The leaflets have very often a whitish horseshoe mark in the center. This plant was formerly reputed very noisome to witches; knights and peasants wore the leaf as a potent charm against their arts. It is supposed that C. found its way into England from the Netherlands about the time of Queen Elizabeth; but it was not until the close of last century that it was introduced into Scotland, where it is now universally prevalent. The ZIGZAG C. (*T. medium*), also called MEADOW C., MARL-GRASS, and COW-GRASS, much resembles the Common Red C., but is easily distinguished by the smooth tube of the calyx, and by the broader, less membranaceous, and gradually acuminated stipules. The stems are also remarkably zigzag, and more rigid than in *T. pratense;* the heads of flowers are larger, more lax, more nearly globose, and of a deeper purple color; and the leaflets have no white spot. It is a common plant in Britain and most parts of Europe.—WHITE or DUTCH C. (*T. repens*) is also a common native of Britain and of most parts of Europe. When a barren heath is turned up with the spade or plough, White C. almost always appears. It is said to be a native also of North America, where, however, it is perhaps only naturalized. The flowers of all kinds of C. are the delight of bees, but those of this species perhaps particularly so.—

Red Clover (*Taifolium pratense*).

White Clover (*Trifolium repens*):
a, head of flowers when the pods are ripening.

ALSIKE C. (*T. hybridum*), a perennial, regarded as intermediate in appearance between the Common Red C. and the White C., has of late attained a very high reputation.

It was introduced into Britain from the south of Sweden rather more than twenty years ago.—CRIMSON C., or ITALIAN C. (*T. incarnatum*), an annual, native of the south of Europe, with oblong or cylindrical spikes of rich crimson flowers, is much cultivated in France and Italy, and has of late been pretty extensively grown in some parts of England, producing a heavy crop.—MOLINER'S C. (*T. Molineri*) very much resembles Crimson C., but is biennial, and has pale flowers. It is cultivated in France and Switzerland.—ALEXANDRIAN C., or EGYPTIAN C. (*T. Alexandrinum,*) an annual species, a native of Egypt, universally cultivated in its native country, where it is the principal fodder for cattle, has been tried in Britain, but the colder climate has been found to render it less luxuriant and productive. It is supposed to be one of the best kinds of C. for many of the British colonies. It has oval heads of pale-yellow or whitish flowers. YELLOW C., or HOP TREFOIL (*T. procumbens*), is very common in dry gravelly soils in Britain, but not much esteemed. It has smaller leaves and heads than any of the cultivated species. Its flowers are yellow.

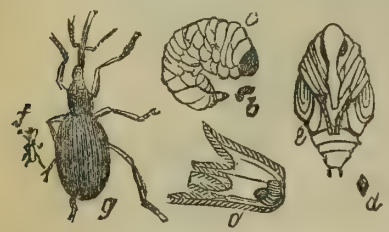
It is little more than a century since clovers were introduced into field-culture in Britain. They are now universally cultivated on large farms in alternation with grain crops. The kinds most generally sown are the *Common Red, Cow-grass, Dutch White, Yellow,* and *Alsike.* The *Common Red* is the finest and most valuable, but it is difficult to grow unless on naturally rich soils. In America it grows well on sandy loams, though sown every alternate year on the same land. But in Britain the land is thought to become 'clover-sick' when sown too frequently with this crop. An interval of not less than eight years is thought advisable. From 6 to 20 lbs. of seed per acre is the quantity sown. Red C. is most esteemed for being mixed with rye-grass for the making of hay. When it grows well, it bears to be cut more than once in a year. *Cow-grass* much resembles the common Red Clover. It is coarser but hardier, and better suited for pasture, as it bears more herbage, and comes better up after being eaten close down by stock. *Dutch White C.* is only esteemed for pasture; it grows short and thick on the ground, but throws out fresh stems and flowers during the most of the growing season. In the south of England, it is sometimes sown with but little rye-grass seed along with it; in Scotland, as much as a bushel or a bushel and a half of rye-grass is mixed with it for pasture. *Yellow C.* is chiefly sown on ground where neither the white nor red grows freely. It is not sown so frequently as it probably ought to be, for it rises early in spring, and a mixture of it with other clovers forms good pasture on all grounds.

Alsike C. has been recently introduced; it rises much higher than White C., and offers to be a useful addition to our pasture-plants. Land must be thoroughly cleaned of perennial weeds be-

fore it is sown with C., as the land cannot be subjected to cultivation while it is under this plant; C., therefore, is always sown in the end of the rotation, or as near the fallow or turnip crop as possible. It is sown early in spring among the winter-wheat, or with the barley crop, and slightly harrowed in; for the seeds being small are not difficult to bury. Farmyard manure is as good as any for clover. A well-manured soil greatly assists in keeping the plants from dying out in spring. Clovers, like grasses, play a most important part in restoring fertility to land which has been exhausted by grain-crops. Their leaves gather food—carbonic acid and ammonia—from the atmosphere, which they store up in their roots and stems; and these, on decomposing, afford food for cereals or other crops which are more dependent on a supply within the soil.

The caterpillars of a number of species of moth feed on the leaves of different kinds of C.; but the insects most injurious to C. crops are weevils of the genera *Apion* and *Sitona*. See CLOVER-WEEVIL and PEA-WEEVIL.

CLO'VER-WEE'VIL (*Apion*), a genus of small pear-shaped weevils (coleopterous insects, section *Tetramera*, family *Rhynchophora*), different species of which feed on the leaves, and their larvæ on the seeds of clover, some also on those of tares and other leguminous plants. Like the other weevils, the perfect insect has the head very much elongated into a sort of muzzle. *A. apricans* often does much injury to fields of common red clover, particularly interfering with the production of seed. It lays its eggs among the flowers, and the little grubs eat their way through the calyx into the pod. It is of a bluish-black color, little more than a line long. *A. flavipes* is attached in like manner to white clover, and other species of clover have their particular weevils.



Red Clover Weevil (*A. apricans*):
a, maggot in calyx, slightly magnified; *b*, larva; *c*, larva, magnified; *d*, pupa; *e*, pupa, magnified; *f*, female beetle; *g*, female beetle, magnified.

CLOVES (Fr. *clou*, a nail) are the flower-buds of the Clove-tree (*Caryophyllus aromaticus*). The genus to which this tree belongs is of the natural order *Myrtaceæ;* the calyx has a cylindrical tube and 4-cleft border; the corolla consists of four petals united by their tips; the stamens are in four clusters; and their fruit is an oblong dry berry with one or two cells and as many seeds. The clove-tree is from 15 to 40 feet high, with a beautiful pyramidal head.

The leaves are large, ovate-oblong, acuminated at each end, evergreen: the flowers are small, but produced in great profusion in cymes. Leaves, flowers, and bark have an aromatic odor. The ripe fruit in shape resembles an olive, but is not quite so large; it is of a dark-red color; it sometimes appears in commerce in a dried state, under the curious name of *Mother Cloves;* it has an odor and flavor similar to C., but much weaker; the broken fruit-stalks are sometimes also used for the same purposes as C.; but the flower-buds themselves are the principal product of the tree. They are gathered, and are dried by exposure to the smoke of wood fires, and afterwards to the rays of the sun, or by the latter, alone. When first gathered, they are reddish, but become of a deep-brown color. The unexpanded corolla forms a little round head at the end of the calyx tube, which is about half an inch long, and thus the appearance is not unlike that of a little nail, whence the name. The clove-tree is a native of the Moluccas, and the Amboyna C. are still esteemed the best; but the tree is now cultivated in Sumatra, Bourbon, Mauritius, and some parts of the West Indies, and will probably soon be common in many other tropical countries. The Dutch, in order to secure to their own colonists a monopoly of the trade in this spice, destroyed the trees in the other Molucca Islands, and confined the cultivation of them to the isle of Ternate. It is not deemed quite certain that C. are the *karyophyllon* of the ancient Greeks; but before the discovery of the Spice Islands, eastern merchants brought them from Arabia, Persia, and Egypt, to the harbors of the Mediterranean, from which the Venetians and Genoese diffused them over Europe.

Cloves:
a, a branch with leaves, buds, and flowers; *b*, a bud.

The Wild Clove-tree of the West Indies is *Myrcia acris*. See MYRCIA.

The properties of C. depend chiefly on an essential oil, *Oil of C.*, which forms one-fifth or one-sixth of their whole weight. They are used for flavoring dessert dishes and articles of confectionary. They have a hot taste and a characteristic odor. The oil of C. is obtained by repeatedly distilling C. with water, when two oils pass over, one of which is lighter, and the other is heavier than water. The oil has a hot acrid taste, is of a light yellow when pure, and brown red when not so carefully prepared. It has a well-known odor, and is soluble in ether, alcohol, and the fixed oils. It is useful in medicine to check nausea and griping, caused by the administration of purgatives. It is also employed in the scenting of soap, and by the distiller. *Tincture of C.* is obtained by treating C. with alcohol for several days, and then straining, or by a solution of the oil of C. in spirits of wine. It is added, in medicine, to stomachic, tonic, and purgative mixtures.

CLOVIS (old Ger. *Chlodwig*, i. e., 'famous warrior;' modern Ger. *Ludwig*, Fr. *Louis*), king of the Franks, was born 465 A.D., and by the death of his father, Childeric, became king of the Salian Franks, whose capital was Tourney. His first achievement was the overthrow of the Gallo-Romans under Syagrius, near Soissons. He then took possession of the whole country between the Somme and the Loire, and established himself in Soissons. In 493, he married Clotilda, daughter of a Burgundian prince. His wife was a Christian, and earnestly desired the conversion of her husband, who, like most of the Franks, was still a heathen. In a great battle with the Alemanni, at Tolbiac, near Cologne, C. was hard pressed, and as a last resource, invoked the God of Clotilda, offering to become a Christian, on condition of obtaining the victory. The Alemanni were routed, and on Christmas Day of the same year, C. and several thousand of his army were christened by Remigius, Bishop of Rheims. Most of the Western Christian princes were Arians, but C. was strictly orthodox, and, in consequence, was saluted by Pope Anastasius as the 'Most Christian King.' In 507, love of conquest concurring with zeal for the orthodox faith, C. marched to the south-west of Gaul against the heretic Visigoth, Alaric II., whom he defeated and slew at Vouglé, near Poitiers, taking possession of the whole country as far as Bordeaux and Toulouse; but was checked at Arles, in 507, by Theodoric, king of the Ostrogoths. C. now took up his residence in Paris, where he died in 511. His great aim was the subjugation of all the Frankish princes, and the union of the whole Frankish people into a single powerful kingdom. The means he employed to secure this end were cruel and unscrupulous, but the end itself would have been very beneficial, if he had not frustrated it at his death by re-dividing the newly organized realm among his four sons, and exposing it to the very perils from which he himself had rescued it.

CLOYNE, an ancient episcopal town, in the S.-E. of Cork county, 15 miles E. by S. of Cork. The see was founded in the 6th c. by St. Colman, the abbey in 707, and the cathedral in the 13th century. Near the cathedral is a round tower, 92 feet high. About 1430, the see was united to that of Cork, separated in 1678, and reunited in 1835. There are valuable marble quarries near. Berkeley was born here, and was bishop of C. in 1678. Brinkley the astronomer was also Bishop of Cloyne. Pop in 1861 was 1713, but in 1871 had fallen below 1500, and in 1881 was only 1126.

CLUB. The word is probably allied to *cleave* (Ger. *kleben*), 'to adhere,' so as to form one body or mass. Among other significations, it is used to mean a company or association met for some common purpose, whether of hilarity, literature, politics, or economy. C., in its usual English acceptation, means a body of persons meeting for social or recreative purposes, and consisting of members belonging for the most part to some one class or occupation. Occasionally, other meanings are given to the word. Societies for political objects are sometimes called clubs; and *Benefit Clubs* are another name for *Benefit Societies*. What is known as club-life, as exhibited in London, had its origin in the days of Elizabeth, when the Mermaid Tavern, in Fleet Street, enlivened by the wit and wisdom of Shakspeare, Raleigh, Ben Jonson, Beaumont, and Fletcher, became the home of a sort of club. Ben Jonson afterwards founded a second C. at the Devil Tavern, in the same street. Such clubs were meetings for social recreation, to which all were welcome who could bring wit and humor with them. In subsequent reigns, meetings of a similar racy character were very frequently held in taverns, but without much club formality. In last century, Brooks's and White's clubs, and

a few others named after the proprietors of the houses in which the meetings were held, were established by politicians of opposite parties, as the head-quarters for parliamentary tactics.

The modern clubs of London, in which the *restaurant* or dining-room is an important feature, arose after the termination of the great war in 1815. Many naval and military officers, being no longer needed for war, were placed upon half-pay; and this half-pay was insufficient to support them without careful economy. If they could dine together at a C., it would be cheaper than if each maintained a separate establishment. Hence originated the United Service C.; and the success of this speedily led to the founding of others for different classes of society, and for persons of different political opinions. At the present time, there are about 100 such clubs in the metropolis, of which the following may be named: Alpine, Army and Navy, Arthur's, Athenæum, Brooks's, Carlton, Civil and Military, Conservative, East India United Service, Garrick, Guards', Junior Carlton, Junior United Service, Naval and Military, New University, Oriental, Oxford and Cambridge, Reform, Travelers', Union, United Service, United University, White's, Whitehall, and Windham's. All these, and some of the others, combine the *tavern* system with the *club* system. There are also about 20 working-men's clubs. Clubs are not confined to the metropolis.

Each principal C. comprises a certain definite number of members; it may be, for instance, 500, 1000, or 1500, and this number cannot be exceeded without a formal change in the rules. In some clubs, the managing committee are empowered to admit distinguished persons to membership; but the general mode of admission is by ballot, each member having a vote. In some clubs, one single black ball or 'No' suffices to exclude a candidate; but, generally, the rules are not so stringent. The members pay a sum of money on entrance, and then an annual subscription—the amounts varying much in different clubs. The entrance-money may be required as capital, to assist in building the club-house, &c.; while the annual subscriptions, after paying current expenses, leave a surplus for future contingencies. The more important clubs comprise morning or news rooms, libraries, coffee-rooms, dining-rooms, drawing-rooms, and a very complete culinary establishment. There are no arrangements for the members to sleep at the club-houses; except at certain establishments called club-chambers, which, however, are not properly clubs. Some of the clubs are furnished with bath-rooms, card-rooms, billiard-rooms, and smoking-rooms. The *restaurant* department is usually very complete; everything is of the best, and is supplied to the members as nearly as can be at prime cost. In nearly all the clubs, hard-drinking is discouraged. It has been ascertained at two or three of them, that the average cost of dinners is about half-a-crown, and that the wine scarcely exceeds half a pint to each diner.

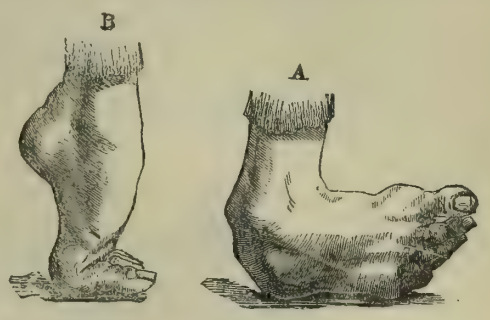
It may here briefly be mentioned, that some of the club-houses rank among the most elegant modern buildings in London. The Carlton, the Reform, the Conservative, and the Army and Navy club-houses are especially to be named in this respect.

Before the first Revolution, it was attempted to get up political clubs in Paris on the English plan, but they were prohibited by the police. With the meeting of the National Assembly, and the outbreak of the Revolution, political societies, about 1789, sprang into unwonted activity. These associations mostly assumed the English name—such as the Club des Feuillans and the Jacobin Club; but they had quite a different character; they were popular societies. In them were concentrated the great political parties of the nation, by means of systematic organization and affiliation. The Jacobin Club thus came in the end to embrace all France, and to rule it. Similar associations sprang up in Germany, Italy, Spain, and wherever the Revolution took any root. In Germany, these unions were prohibited in 1793 by a law of the empire; and the prohibition of all political unions and meetings was renewed in 1832 by an act of the Germanic Confederation. The suppression of the clubs in France followed the extinction of the Revolution, and their place has since been taken by secret societies. After the revolution of 1848, clubs revived in great force in Italy and Germany, after the style of the first French Revolution, but speedily came to an end along with that which had given them birth.

CLUBBING, in cabbages, turnips, and other plants of the genus *Brassica*, a diseased growth of tubercular excrescences in the upper part of the root or lower part of the stem, caused by the larvæ of the Cabbage Fly (q. v.), and of other insects, by which the vigorous growth of the plant is prevented, and crops are often much injured. It is common for gardeners to cut away these excrescences, with their contained larvæ, in planting out young cabbages, &c.; and where they are not so numerous that the injury done by the knife is necessarily great, this plan succeeds very well. Dressings of quick-lime, wood-ashes, &c., have been recommended, and appear to have proved partially successful in preventing this evil, probably by deterring the parent insect from approaching to lay her egg; but change of crop, when practicable, is of all things the most commendable. C. is sometimes confounded with Anbury (q. v.), from which it is quite distinct.

CLU'B-FOOT (Lat. *talipes*) is a distortion or twisting of the foot by one or more of its muscles being permanently shortened. It may exist from birth, or occur in early childhood after convulsive fits. Surgeons recognize four varieties of C.: turning inwards (*varus*), outwards (*valgus*), downwards with elevation of the heel (*equinus*), or upwards with depression of the heel (*calcaneus*).

As age advances, the bones alter in form from the pressure exerted upon them, the ligaments shorten, and the foot becomes



Club-feet:—A, Talipes Varus; B, Talipes Equinus.

rigidly moulded in its unnatural position. It cripples the person's movements, and in many instances has proved a great affliction. Lord Byron's whole life seems to have been embittered by one of his feet being inverted.

Although Lorenz, in 1784, cut the tendo Achillis to lower the heel in talipes equinus, yet, owing chiefly to the dangers of cutting across tendons, C. was practically incurable till 1831, when Dr. Little of London, having himself a C., after seeking relief from many surgeons at home and abroad, found his way to Dr. Stromeyer, at Erlangen. This ingenious surgeon introduced a narrow-bladed knife, and divided the tendons of the contracted muscles with such a small external wound that scarcely any inflammation resulted. Dr. Little being cured, published a treatise on the subject, and at the present day no deformity of the foot is considered irremediable. However, it must be remembered that the division of tendons must be followed by judicious manipulations, and generally by the application of some suitable apparatus to prevent the foot returning to its former position. Of such apparatus, Scarpa's Shoe, as it is termed, may be mentioned as the one most frequently in use.

CLU'B-MOSS. See LYCOPODIACEÆ.

CLU'B-RUSH. See SCIRPUS.

CLUNCH, a name given locally by miners to any tough indurated clay, such as is sometimes found in the coal-measures, or in the newer strata. The term has also been applied to the lower and harder beds of the cretaceous rocks, which are sometimes used for the stone-work of the interior of ecclesiastical buildings.

CLUPE'IDÆ, an important family of Malacopterous (q. v.) fishes, nearly allied to the *Salmonidæ*, and differing from them chiefly in the want of an adipose fin. They are all scaly fishes, but the scales are very easily detached. None of the fins have any spinous rays. The ventral fins are nearly in the middle of the body. The dorsal fin is always solitary. The gill-openings are very large. The teeth are small and generally numerous. The maxillary bones are composed of three pieces easily separated. The body is generally elongated, and much compressed; the belly thin, and almost reduced to a sharp edge, frequently denticulated by the edges or points of a series of small bones attached to the skin. The air-bladder is always large; the roe consists of a vast number of eggs. The fishes of this family are almost exclusively marine, only a few of them ascending rivers. They generally congregate in shoals and some of them periodically visit certain coasts in vast multitudes. They are very widely diffused over the world; some of the particular species have a wide geographic range. To this family belong the Herring, Pilchard, Sprat (Garvie, Kilkie), Anchovy, Sardine, White-bait, &c. See these articles. The Herring may be regarded as the type of the order, and of the genus *Clupea*. But the genera most important in an economical point of view have been very differently distinguished by different ichthyologists.

CLUPESO'CIDÆ, a family of Malacopterous fishes, so named from being regarded as exhibiting characters intermediate between those of the *Clupeidæ* (Herring, &c.) and of the *Esocidæ* (Pike, &c.). Some of them are marine, and some are fresh-water fishes. They are mostly tropical; none are British. To this family belongs the interesting genus *Arapaima* (q. v.), and the

genera *Heterotis* and *Butirinus*, containing fishes of very curious structure and appearance, highly prized for the table.

CLU'SIA (named in honor of the great botanist L'Ecluse or Clusius) a genus of tropical trees and shrubs of the natural order *Guttiferæ* (q. v.) or *Clusiaceæ*, some of which are commonly called Balsam trees, from their resinous or balsamic products.

They are very often *epiphytes*, growing on larger trees, over the bark of which their roots spread in search of chinks or decayed parts where they may obtain nourishment; and if it cannot be obtained in sufficient quantity, a root is sometimes sent straight down to the ground, and in due time becomes a kind of stem. The fruit is very curious, a subglobular capsule, with a number of cells, opening as by meridian lines from top to base. *C. rosea*, a native of the West Indies and tropical parts of America, yields an abundant resin, which is used as an external application in veterinary medicine, and for covering boats instead of pitch. A great quantity of resin exudes from the disk of the flowers of *C. insignis*, the WAX-FLOWER of Demerara, which is used to make a gently stimulating and soothing plaster. This is one of the productions of Demerara, to which the colonists, in preparation for the 'Great Exhibition' (of 1862), sought to draw general attention.

Clusia Rosea: 1, an expanded flower; 2, a calyx seen from below; 3, the ovary, with a part of the calyx cut away; 4, a transverse section of a fruit.

CLUSO'NÉ, a town of Lombardy, Northern Italy, situated near the left bank of the Serio, 17 miles north-east of Bergamo. It has manufactures of linen, a trade in corn and iron, and in the neighborhood are vitriol works and copper foundries. Pop. 3000.

CLU'STERED CO'LUMNS, or, as they are sometimes called, Compound Piers, form one of the richest features in Gothic ecclesiastical architecture. The columns or shafts are sometimes attached to each other throughout their whole length, sometimes only at the base and capital. When surrounded by floriated fillets, they have been very aptly compared by Sir Walter Scott, to "bundles of lances that garlands have bound.'

CLWYD, a river of North Wales, rises in the Brombanog Hills, is in the south-west of Denbighshire, and runs 30 miles, first south, then east-north-east, and lastly north, through Denbigh and Flint shires, past Ruthin, St. Asaph, and Rhuddlan, into the Irish Sea. Below Ruthin, and between barren hills, lies the fertile, populous, and level vale of the C., 15 by 5 to 7 miles. At St. Asaph, the C. receives the Elwy, 20 miles long, from the west, and increases much in size. It then enters the fertile and extensive marsh of Rhuddlan, and falls into the sea by a small estuary. It is navigable for vessels of 70 tons up to Rhuddlan, a distance of two miles from its mouth.

CLYDE, a river in the south of Scotland, the only great British river, besides the Severn, flowing west. Commercially it is the most important river in Scotland, and the romantic beauty of its scenery is widely celebrated. It rises by several large streams in the semicircular range of the Lead, Lowther, and Moffat Hills, and drains the shires of Lanark, Renfrew, and Dumbarton. The main and southmost source, the Daer, runs north, and receives the Powtrail, the Clyde (a smaller stream after junction with which the main stream is called the C.), and other streams, preserving its mountain character to Roberton, upwards of 20 miles below the sources of the Daer. The C. then bends round Tinto Hill towards Biggar,* from whence it flows north-west west, and south-west, to about 4 miles above Lanark, thence, pursuing a north-west course through Lanarkshire, and between Dumbarton and Renfrew shires, past Lanark, Hamilton, Glasgow, Renfrew, and Dumbarton, near which town it opens into the Firth of Clyde. In this course, it receives a number of streams, and flows through a rich fertile, wooded valley, often extending into level plains, and often with bold wooded banks. From 2 miles above to 4 miles below Lanark occur the celebrated Falls of the C., a series of cascades and rapids, the largest in Scotland for quantity of water—the total descent, in the course of six miles, being 230 feet over old red sandstone rocks, amid very picturesque scenery. Three of the Falls are above, and one below Lanark. Bonniton Linn, two miles above Lanark, is a cascade of 30 feet, with some parts only 4 feet broad. Corra Linn, half a mile below the last, is the grandest fall, forming three distinct leaps—in all, 84 feet high. Dundaf Fall is 10 feet high. Stonebyres Linn, two miles below Corra Linn, forms three distinct falls—in all 70 feet. Below Glasgow, the C. expands into an estuary, navigable by the largest vessels, and at Greenock it attains a breadth of about 4 miles. Opposite this point it communicates with the Gareloch, and a little below, with Loch Long on the north. Its course, which from Glasgow has been west-north-west, now turns suddenly south, in which direction, inclining a little to the west, it continues to flow between Argyle and Bute, and Cantire on the west, and Renfrew and Ayr shires on the east, until it becomes identified with the North Channel at Ailsa Craig, where its breadth is about 30 miles. The C. from its source to Glasgow is, by its windings 75 miles long, and from Glasgow to the south end of Cantire, 48 miles. Its basin occupies 1500 square miles and consists of carboniferous strata and trap rocks, the latter chiefly forming the bordering mountains. Floods sometimes raise its waters 20 feet, and it has changed its course at Renfrew, which was once close to it. Clydesdale, or the valley of the C., is noted for its coal and iron mines, orchards, and horses. Bell, in 1812, launched on the C. the first boat in Europe successfully propelled by steam.

* In very high floods, the waters of the Clyde sometimes overflow in the boggy ground there, and a portion runs into the Biggar Water, and so into the Tweed.

CLYDE, LORD. See CAMPBELL, SIR COLIN.

CLY'STER (Gr., from *klyzo*, I wash out), called also *enema*, a medicine administered in the liquid form by the rectum, or lower end of the intestine. It is used either for the purpose of procuring evacuation of the bowels, or of conveying stimulating or nourishing substances into the system. For the latter purpose, wine, and beef-tea, or milk, in quantities of a few ounces at a time, are employed; for the former, simple warm or cold water in sufficiently large quantities to distend the bowels, and produce evacuation; or in special cases, various cathartics may be used in addition, such as colocynths, aloes, caster oil, or turpentine made into an emulsion with yolk of egg, and sometimes carminatives to expel air. Narcotic clysters are also employed, but should only be used under medical superintendence. An injecting syringe, with a flexible tube, and a double-action valve, is usually employed for the administration of this remedy.

CLYTEMNE'STRA, in Homeric legend, the daughter of King Tyndareus and of Leda, and the twin-sister or Helena, became the wife of Agamemnon, and bore him a son, Orestes, and two daughters, Iphigenia and Electra. During the absence of Agamemnon on his expedition to Troy, she formed a connection with Ægisthus, murdered her husband on his return, and reigned for seven years with Ægisthus, till she was murdered by her own son, Orestes.

CNI'DUS, or GNIDOS, a city on the promontory of Triopion (now Cape Krio), in Caria, in Asia Minor, a Lacedæmonian colony, and one of the six cities of the Doric league. C. (according to Strabo) had two ports, one of which could be closed. In front of what was the town, lies a lofty island, about 600 yards long, which was connected with the mainland by a causeway (now a sandy isthmus). The southern port was formed by two moles, carried into the sea to the depth of nearly 100 feet, one of which is nearly perfect at the present day. The city was famous for several temples of Venus, who was therefore sometimes called the Cnidian goddess. One of these temples contained the famous statue of the naked Venus by Praxiteles. It was of Parian marble, and so beautiful, that Nicomedes, king of Bithynia, offered, in return for this master-piece of Grecian sculpture, to pay the entire debt of the city, which was very large. The Cnidians, in the excess of their devotion to art, refused. During the wars in ancient times, C. was often mercilessly plundered. The site of the city is 'covered with ruins.'

COACH is a general name for a vehicle drawn by horses, designed for the conveyance of passengers, as distinguished from a wagon or cart, for the conveyance of goods. Coaches or enclosed carriages, drawn on wheels, and intended for passengers, were inventions which have been claimed by Hungary, England, Italy, France, Spain, and Germany. The name is derived by Wedgwood from Fr. *coucher*, to lie, which becomes in Dutch *koetsen*, whence *koetse* or *koets-wagen*, a litter or carriage in which you may recline. The earliest record found by Beckmann relates to about the year 1280, when Charles of Anjou entered Naples, and his queen rode in a *caretta*—apparently a small but highly decorated car, from which the modern *charet* or *chariot* was derived, as well as other vehicles named *chares* and *chariettes*. It is believed that most of these vehicles had broad wheels, the only form suited for the wretched roads of those ages; and it is certain that all those of early date were open overhead. Many of the coaches used by the continental princes and nobles in the 16th c. were closed only to this extent—that they had canopies supported by ornamental

pillars, and curtains of cloth, silk, or leather, which could be drawn easily aside. A *glass* C., or C. with glass windows, is specially mentioned as being used by an Infanta of Spain in 1631. The traces of these coaches were at first made of rope; those only belonging to the highest personages were made of leather. It is believed to have been in the time of Louis XIV. that coaches were first suspended by leathern straps, in order to insure ease of motion.

The first C. ever seen in England is said to have been one made in 1555 by Walter Rippon for the Earl of Rutland; and in 1564, the same builder made a showy vehicle for Queen Elizabeth. Later in the reign, the royal carriages had sliding panels, so that the queen could show herself to her loving subjects whenever she desired. During the closing years of Elizabeth's reign, and early in the 17th c., the use of pleasure-carriages extended rapidly in England. The coaches had first to struggle against the opposition of the boatmen on the rivers, and then against that of the sedan owners and bearers; but they gradually came into very general use. The successive steps whereby the coaches of those days gave way to the elegant vehicles of the present, need not be traced in detail, even if there were the means to do so.

The following are some of the chief kinds of pleasure-carriages. The *Dennet* is a two-wheeled vehicle for one horse, with a jointed hood or head covered with leather, and a driving-box. The *Stanhope* bears some resemblance to the dennet. The *Tilbury* is in like manner a two-wheeled vehicle for one horse; but it has pliable leathern braces between the springs and the body of the vehicle, together with suspension brackets. The *Cabriolet* belongs to the same class as the tilbury. The name *Cab* is an abbreviation of cabriolet, but it has come to be applied to a four-wheeled vehicle. The *Curricle* is a two-wheeled vehicle for two horses; there are no shafts; but a pole, fixed to a frame which supports the body, passes between the horses, and is suspended from a metal bar resting on their backs. The *Phaeton* is a four-wheeled vehicle which may be drawn either by one or two horses; its front body is something like that of a dennet or stanhope, and behind this is an open seat, supported on a kind of large box. The *Coach* is a closed four-wheeled vehicle for two or more horses, with two seats inside, and

State Carriage of Queen Elizabeth :– From Hoefnagel's print of Nonsuch Palace.

a skilfully constructed arrangement of springs to insure ease of motion. The *Chariot*, or chaise of modern days, usually differs from the C. in having only one seat. The *Landau* is a C. made to open occasionally. The *Barouche* is permanently open, with only a leathern hood or head over it. The *Britzschka* is a kind of small barouche. In addition to these, our age has witnessed the manufacture of the *Brougham*, a miniature coach usually for two persons, but in which four may be accommodated; and the *Clarence*, a pair-horse carriage with movable glazed panels and hood, and for two or more persons.

The manufacture of carriages, whether pleasure-vehicles or omnibuses, ranks in the highest class of mechanical labor. There is a necessity for the best materials and the best workmanship: since, owing to the severe strains and jerks to which the vehicles are subject, cheap construction is in the end unprofitable. Many different kinds of wood are employed in the construction. The body of the C. is made by one set of workmen, the under-framing by another; the former partaking more than the latter of the nature of cabinet-work. The steel-spring making is delicate work, owing to the necessity of combining strength with lightness and elasticity; and the various pieces of iron-work require careful adjustment, especially the axles. The covering of the upper part of a body of a C. with leather is one of the most difficult parts of the manufacture; one single hide is employed, the leather being worked round the corners by repeated currying while wet; and all must be rendered smooth, without even a puncture. The best coaches receive as many as 20 to 30 coats of oil-paint; and the polishing processes are numerous and carefully conducted. The carving, gilding, herald-painting, lace and fringe work, metal ornamentation, &c.—all are among the best examples of their respective handicrafts.

English carriages are considered to be the best in the world; none else combine so much strength with an equal degree of beauty. The artisans employed in this trade, especially coach-body makers and coach-spring makers, command a very high rate of wages.

COACH-DOG, or DALMATIAN DOG, a variety of dog apparently allied to the hounds, although it is said to be deficient both in keenness of scent and in sagacity. It is often kept in stables, becomes attached to the horses, and may be seen running after carriages. Its general light color and numerous dark brown or black spots are constant characteristics; as are also its short hair, tail destitute of brush and inoffensive disposition. Its origin is uncertain; the name Dalmatian is probably altogether misleading; and it is supposed that it may have been brought from India, where a very similar kind of dog exists.

COADJU'TOR (Lat.), a fellow-worker not as principal but as second, an assistant. Technically, it is applied in ecclesiastical law to one appointed to assist a bishop, whom age or infirmity has disabled. By 52 Geo. III. c. 62, coadjutors to bishops and archbishops in Ireland are empowered to exercise all the powers of their principals except that of presenting to benefices. See EXECUTOR.

COAGULA'TION, the amorphous (q. v.) solidification of a liquid, or part of a liquid, as when the caseine of milk is solidified by rennet in making Cheese (q. v.), or the white of an egg by boiling. The process varies in various substances. Albumen, or the white of an egg, coagulates at a temperature of 160°. Milk is coagulated or curdled by the action of rennet or by acids. The fibrin in the blood, chyle, and lymph of animals is coagulated by the separation of these fluids from the living body. See BLOOD.

COAHUI'LA, a state of the Mexican Confederation, is separated from Texas, in the United States, by the Rio Bravo del Norte, in lat. 24°—30° N., and long. 100°—103° E. It contains 50,000 square miles, and (1873) 98,397 inhabitants. The capital is Saltillo, with a population of 8105; there are besides the towns of Coahuila and Santa Rosa. It possesses some silver mines; but it is valuable chiefly for its pasturage.

COA'ITA. See ATELES.

COAL, in the sense of a piece of glowing fuel (and hence a piece of fuel, whether dead or alive), is a word common to all the languages of the Gothic stock (Icel. *kol*, Ger. *kohle*), and seems allied to the Lat. *caleo*, to be hot; as also to *glow*, and *kiln*. The different sorts of fuel are distinguished by prefixes, as *char*coal, *pit*-coal, *sea*-coal; but in England, owing to the absorbing importance of mineral or pit-coal, the word C. alone has come to be used in this special signification (Ger. *steinkohlen*, Fr. *charbon de terre*).

C. is one of the most important of all minerals; it consists chiefly of carbon, and is universally regarded as of vegetable origin. Its geological relations are noticed in the article CARBONIFEROUS SYSTEM. It generally occurs in strata or beds; it is always of a black or blackish-brown color; some of the varieties have a very considerable degree of vitreous or resinous lustre, and some are very destitute of lustre; some have a shell-like fracture, and some have a sort of slaty structure, and are readily broken into cubical or rhomboidal fragments.

The precise characters of C. as a mineral species are not easily defined, and both in Britain and other countries important cases have occupied courts of law, in which this difficulty was strongly felt, as in the great Scottish lawsuit concerning the *Torbanehill Mineral* (q. v.). C., indeed, is rather a commercial than a scientific term, but in a general way we may define it as a fossil fuel of black color and stony consistency, which, when heated in close vessels, is converted into coke with the escape of volatile liquids and gases. The variety known as blind coal or anthracite no doubt gives off scarcely any volatile matter, but this is because it has undergone a natural distillation through metamorphism or other cause. We may therefore divide C. into two primary divisions, namely, (1) *Anthracite*, which does not, and (2) *Bituminous C.*, which does flame when kindled. Anthracite (q. v.) sometimes

contains as much as 94, and if we exclude the ash, 98 per cent. of carbon, and as this element decreases in amount it graduates into a bituminous coal. The term anthracite is, however, still applied to some coals which do not contain more than 80 per cent. of carbon. Various synonyms, such as stone C., glance C., culm, and Welsh C., are also used to designate this substance, which is used chiefly for smelting purposes and for raising steam. It is difficult to kindle, but gives out a high heat in burning. Bituminous C. includes an almost endless number of varieties, one of the best marked being *cannel* or *parrot C.* Cannel C. is so called from burning with a bright flame like a candle, and the name parrot C. is given to it in Scotland from the crackling or chattering noise it makes when burned. That of different localities varies much in appearance, but it is most commonly dull and earthy, or with only a slight lustre; some examples are, however, bright and shining. In texture it is nearly always compact, and certain beds of it admit of being polished in slabs of considerable size, which approach black marble in appearance. Of this material vases, inkstands, boxes, &c., are made. Cannel C., from the large percentage of ash which it contains, is not suitable for house fires, and is for the most part consumed in making gas, of which it yields from 8000 to 15,000 cubic feet per ton. When distilled at a low red-heat it yields paraffine oil. The other varieties of bituminous C. are so numerous that, as an Admiralty report states, there are as many as 70 denominations of it imported into London alone. Still, among these there are three leading kinds—1. *Caking C.*, which cakes or fuses into one mass in the fire. It breaks into small uneven fragments, and is found largely at Newcastle and some other localities. 2. *Splint or hard C.*, occurring plentifully in Scotland, which is hard, and has a kind of slaty fracture. It is not very easily kindled, but when lighted makes a clear lasting fire. 3. *Cherry or soft C.*, which breaks easily into small irregular cubes, has a beautiful shining lustre, is readily kindled, and gives out a cheerful flame and heat. It is common in Staffordshire. Brown C. or Lignite (q. v.), though inferior to true C., is nevertheless an important fuel in some countries in default of a better kind.

The use of C. does not seem to have been known to the ancients; nor is it well known at what time it began to be used for fuel. Some say that it was used by the ancient Britons; and at all events it was to some extent an article of household consumption during the Anglo-Saxon period as early as 852 A.D. There seems to be reason for thinking that England was the first European country in which C. was used to any considerable extent. About the end of the 13th c., it began to be employed in London, but at first only in the arts and manufactures; and the innovation was complained of as injurious to human health. In 1316, the parliament petitioned the king, Edward II., to prohibit the use of C., and a proclamation was accordingly issued against it; but owing to the high price of wood, its use soon became general in London. It was for a long time known there as *Sea-C.*, because imported by sea.

Several theories as to the mode of the origin of C. have been put forth from time to time. The one now generally believed in is that the rank and luxuriant vegetation which prevailed during the carboniferous age grew and decayed upon land but slightly raised above the sea; that by slow subsidence this thick layer of vegetable matter sunk below the water, and became gradually covered with sand, mud, and other mineral sediment; that then, by some slight upheaval of the sea bottom or other process, a land surface was once more formed, and covered with a dense mass of plants, which in course of time decayed, sank, and became overlaid with silt and sand as before. At length, thick masses of stratified matter would accumulate, producing great pressure, and this, acting along with chemical changes, would gradually mineralize the vegetable layers into coal. Some experiments made by Dr. Lindley a few years ago, showed that of a large number of plants kept immersed in water for two years, the ferns, lycopodiums, and pines were those which had the greatest powers of resisting decay, and C. appears to be mainly composed of the substance of the ancient representatives of these three orders of plants. The interesting fact has also been lately proved by Huxley, Morris, Carruthers, and others, that in many instances the bituminous matter in C. is almost wholly formed of the spore cases and spores of plants allied to our club-mosses and ferns.

As will be seen from the following table, wood, peat, lignite, or brown C., and true C. indicate by their own composition the changes which vegetable matter undergoes by decay and pressure; and a table in which a considerable number of examples of each substance could be given would show how gradually these substances pass into each other :

	Wood.	Peat.	Lignite.	Coal.
Carbon	50·0	60·0	65·7	82·6
Hydrogen	6·2	6·5	5·3	5·6
Oxygen	43·8	33·5	29·0	11·8
	100·0	100·0	100·0	100·0

In each of these bodies there is usually a small precentage of nitrogen, which in the above table has not been separated. In passing from wood or peat to C., the proportion of oxygen and hydrogen decreases, these substances being given off in the form of marsh-gas and carbonic acid in the process of decay.

Since the prosperity of our great national industries, as well as much of our domestic comfort, depends on the continuance of an abundant supply of cheap fuel, much anxiety has arisen in Great Britain of late years regarding the future supply and price of coal. Since the fall of 1872, a great rise has taken place in its price. This is partly owing to the unusually high rate of miners' wages which has prevailed, and partly to the fact that some of the richest and most easily worked English coal-seams are becoming exhausted. There is therefore some cause for apprehension, yet, as the following figures taken from the estimate in the report of the royal commission on C., dated 1871, will show, we have still vast supplies of fossil fuel.

Taking into account the coal which probably exists under the Permian, New Red Sandstone, and other superincumbent strata in the United Kingdom, the coal commissioners increase their estimate of the quantity still available for use to 146,480 millions of tons. (The quantity raised in 1881 was 154,000,000 tons from 3813 collieries.) But, as may be supposed, the estimates which have been put forth regarding the probable duration of our coal-fields are very various, some authorities asserting that, owing to increase in population, and the increasing consumption of coal in manufactures, about 100 years will suffice to exhaust them. Between this and the other extreme of about 1000 years, formed on the assumption that hereafter the population of the country will but slightly increase, there are innumerable conjectures and estimates.

AVAILABLE COAL IN THE CHIEF BRITISH COAL-FIELDS, AT DEPTHS NOT EXCEEDING 4000 FEET, AND IN SEAMS NOT LESS THAN 1 FOOT THICK.

	Tons.
South Wales	32,456,208,913
Midland (Yorkshire, Derbyshire, and Nottinghamshire)	18,172,071.433
Northumberland and Durham	10,036,660.236
Lancashire and Cheshire	5,546,000,000
Bristol	4,218,970,762
North Staffordshire	3,825,488,105
Lesser English coal-fields	5,952,740,019
Total of Scottish coal-coals	9,843,465,930
Total of Irish coal-fields	155,680,000
Grand total	90,207,285,398

On the continent of Europe, productive coal-fields occur in Belgium, France, various parts of Northern Germany, Spain, and Russia. By far the largest in area are those of Russia, and they are known to contain many valuable beds of C., although, as yet, comparatively little has been worked. C. is also found in India, China (where the coal-fields are estimated to cover 400,000 square miles), Japan, and the Malayan Archipelago, in Australia and New Zealand, and in Africa. Turning to the New World, there is evidence of promising coal-deposits in several South American countries, but, owing to the great supply of wood in their forests, there is little temptation to work them. In Canada, Nova Scotia, New Brunswick, and Newfoundland, there are small, though valuable, coal-fields; but in the United States, enormous fields of fossil fuel are found. The entire area of these is about 200,000 square miles, being 38 times greater than the area of the coal-fields of Great Britain. But although the coal-measures of the States are of vast extent, and contain many valuable coal-seams—a few of them 40 and even 50 feet thick at certain places—it has been doubted whether the amount of workable C. in them is not greatly exaggerated by American writers. In proportion to the extent of the seams, the quantity of C. annually raised in the States is small, being only about 70,000,000 tons.

Coal-trade.—The production and sale of C., like every other important branch of industry, was long fettered with legislative regulations. At a very early period, the corporation of the city of London undertook the duty of either weighing or measuring the C. brought into the port, and by a series of statutes, commencing with 7 Ed. VI. c. 7, the mayor and aldermen of London, and the justices of the counties, were empowered to fix the price of C. to be sold by retail; and in case of refusal by the parties to sell at the prices fixed, to enter their wharves, or other places of deposit, and to cause it to be sold at the prices which they had set. In addition to the general supervision which they thus possessed, and the sums which they were empowered to exact for their trouble, the corporations of London and other towns have exacted, and still continue to exact, dues on C. for local purposes. These were first imposed in London in 1667, after the great fire, in order to enable the corporation to repair the ravages which it had committed; and they have been since continued as a fund for civic improvements, though, as Mr. M'Culloch has remarked, no im-

provement could be equal to a reduction in the price of coal. In the reign of William III., a general tax, payable to government, was laid on all *sea-borne C.*—a tax which was in the highest degree unjust to places which were dependent for their supply on the coasting-trade, and oppressive to the whole country, inasmuch as it amounted to more than 50 per cent. on the price paid to the owner at the pit's mouth. The tax varied in amount, not only at different periods, reaching its highest point of 9*s.* 4*d.* per chaldron during the great war, but also in different parts of the country, being higher in London and the south of England, and lower in Ireland and Wales, whilst Scotland for a considerable period was altogether exempt.

The tax itself, with all its inequalities, was abolished in 1830, and there is now no tax on C. except that collected for local purposes in London, and a few other towns. The repeal, in 1845, of the duty on C. exported to foreign countries, was a measure of much more doubtful policy. The average annual quantity of C. exported from Great Britain during the three years ending 1880 was above 14,000,000 tons.—For the provisions of the recent statutes for the regulation and inspection of mines (23 and 24 Vict. c. 151, and 35 and 36 Vict. c. 76), see MINES. The circumstances in which coal-mines are regarded as a pertinent of land, and those in which they form a separate estate, are stated under MINES.

Coal-note, a particular description of promissory-note, used in the coal-trade in the port of London (3 Geo. II. c. 26, ss. 7, 8). See COAL-SUPPLY, and the article MINING.

COA'L-BEDS. See CARBONIFEROUS SYSTEM.

COA'LBROOK DALE, an English coal-field in the valley of the Severn, which supplies considerable quantities of coal and iron. The group of strata which includes the coal-beds is from 700 to 800 feet thick.

COA'L-FISH (*Merlangus carbonarius*), a fish of the same family with the Cod and Haddock (*Gadidæ*), and of the same genus with the Whiting. It is not unlike the whiting in form, and in its fins, which, however, are not proportionally so large; but is of a very different color, the upper parts being nearly black. It attains, also, a much larger size, being often two or three feet in length. It is celebrated among fishermen for its voracity; and is commonly found in large shoals, which, when attracted by bait, will keep near a boat till great numbers are taken. It is rather a coarse fish, but is much used in the northern parts of the world, both fresh and salted, or dried. It is found in the most arctic regions, even on the shores of Spitzbergen, and both on the European and American sides of the Atlantic. It is very plentiful on the British coasts, and in Scotland is generally known as the *Sethe*. The fry are taken in great numbers by juvenile fishers stationed on rocks, and are called *podleys* on the east and west coast of Scotland, *sillocks* and *cuddies* on some of the Scottish coasts, and *coalseys* in the north-east of England. This fish forms an important part of the food of the Orkney and Shetland islanders, and of the inhabitants of some of the Hebrides. Vast numbers of the fry are sometimes caught by means of blankets in the mouths of streams in the Hebrides. The liver of the C. abounds in oil, which is used for lamps.

COALI'TION, in Politics, is applied to the union of two parties, or, as it generally happens, portions of parties, not of the same opinion, who yet agree to sink their differences, and act in common. Pitt the elder, when he took office in 1757, coalesced with the Whig aristocracy represented by the Duke of Newcastle. The ministry always spoken of, however, as the Great C. was formed in 1782, when Fox, the leader of the Reformers, took office along with Lord North, the leader of the opposite party. When Lord Derby's ministry resigned in 1853, there was a short C. between the Whig party, under Lord John Russell, and the more moderate of the Conservative party, under Lord Aberdeen.

COAL-SUPPLY. Referring to CARBONIFEROUS SYSTEM and COAL for various details connected with the localities of coal-beds, the diversity of qualities, and the modes of working, we shall treat here of a question which has recently been accepted as one of great importance to the welfare of the nation—viz., the amount of available supply. All the coal now existing was formed untold ages ago, when the conditions of temperature and moisture on the earth's surface were different from those now prevailing. Coal is not a growth annually renewable, but an accumulation which we are gradually spending. We are living, not on the interest of our coal, but on the capital. This is a truth which scientific men have recognized for some time past; but statesmen and manufacturers, mine-owners and merchants, have paid singularly little attention to the subject, under the supposition that the existing stock will last for so great a period as to relieve us from all anxiety on the matter. John Williams in 1789, Sir John Sinclair in the *Statistical Account of Scotland*, Robert Bold in 1812, and Dr. Buckland in 1830, were almost the only writers, until recently, who cautioned England that her supply of coal will not last forever. Two volumes on the *Coal Question*, however, by Mr. Hull and Mr. Jevons respectively, effectually roused public attention to the matter.

At the Newcastle meeting of the British Association in 1864, Sir W. G. Armstrong, as chairman, forcibly urged the subject on the attention of scientific and practical men. He said: 'Contemplating the rate at which we are expending those seams of coal which yield the best qualities of fuel, and can be worked at the least expense, we shall find much cause for anxiety. . . . We have already drawn from our choicest mines a far larger quantity of coal than has been raised in all other parts of the world put together; and the time is not remote when we shall have to encounter the disadvantages of increased cost of working, and diminished value of produce.' He urged especially that we ought not to squander our coal as at present. We waste nearly all the smoke, heated air, and heated gasses from our furnaces; we waste sadly in our open fireplaces; and there is a vast quantity of small-coal recklessly burned at the pit's mouth. Various statistics as to supply and consumption had furnished Sir W. G. Armstrong with his data. So widely have estimates differed as to available quantity still in store, that between 1792 and recent times, the conjectures, for Northumberland and Durham alone, varied from 200 years to 1700 years, as the period during which the whole nation could be supplied from this one coal-field; but more earnest attempts have been made in late years to arrive at approximate figures. In 1857, M. De Carral, a Prussian mining-engineer, estimated the coal-mining of that year in all countries at 125 million tons, with an average value of 7*s.* per ton at the pit's mouth; he credited Prussia with enough unexhausted coal to supply all the world for 900 years.

In 1861, Mr. Robert Hunt ascertained, by reliable mineral statistics, that Great Britain raised 86 million tons in the year; that the quantity was increasing by nearly three million tons every year; and that we were working our mines at thrice the rate which had been in force 20 years before. These facts had much influence in drawing the attention of public men to the subject. The produce of Great Britain in 1861 was from 3052 collieries; and the different districts joined in the supply as follows: Durham and Northumberland, 19 million tons; Lancashire, 12; Yorkshire, 9; Staffordshire and Worcestershire, 7; South Wales, 7; Derbyshire and Nottinghamshire, 5; Scotland 11: all other districts, 16—amounting to a total of 86 million tons. M. Burat, in his *Situation de l'Industrie Houillère en* 1864, estimated the coal produce of the world at 141 million tons, of which he credited Great Britain with about four-sevenths. In the same year, Sir W. G. Armstrong, taking Mr. Hull and Mr. Hunt as his authorities, estimated the available stock of coal in the United Kingdom at 80,000 million tons, rejecting all seams below 4000 feet as too deep to work, and all less than two feet thick as too thin to work. Taking 1864 as a standard of consumption, it would last 930 years; but at the rate of increase of recent years, it would only last 212 years, because this rate would be geometrical and not merely arithmetical in its progression.

In the year 1866, the question came into the arena of the British parliament. On April 17, during a discussion in the House of Commons on the malt-tax, Mr. J. Stuart Mill dwelt on the fact, that coal is one of our greatest sources of national wealth; and he accepted as trustworthy the calculations of Mr. Jevons—that in three or four generations, we shall have scarcely any usable coal at a less depth than 4000 feet, a depth which will either be unworkable, or workable only at a greatly increased cost. This speech made a great impression on the House; and the government, a few days afterwards, undertook to ascertain what facts the officers of the Geological Survey possessed on the subject. On May 3, the Chancellor of the Exchequer, Mr. Gladstone, made his financial statement for the year, in which he accepted Mr. Mill's views, based as they were on the opinions of Sir Roderice Murchison, Sir John Herschel, Sir W. G. Armstrong, Dr. Percy, Mr. Hull, Mr. Jevons, and other authorities. He assented to the probability that by the year 1970, if matters go on at their present rate, we shall have no coal left. 'I disbelieve and disapprove,' he added, 'of all attempts to limit by law the consumption of coal. In vain would it be to think of stopping the consumption of coal in this country; in vain would it be to think of diminishing that consumption by the imposition of a tax; and it would be more vain still to think of prohibiting its exportation.' In other words, the remedy, if any, can *not* be by legislation. The question was brought to a decisive point on June 12, when Mr. Hussey Vivian moved an address to the crown, praying for the appointment of a royal commission to investigate the whole matter.

In an elaborate speech, he stated his reasons for believing that the forebodings of Mr. Hull and Mr. Jevons are too gloomy—that advancing science will enable miners to contend against the temperature and pressure of deeper mines than have hitherto been thought practicable; that we shall be better able than ever to ventilate and drain the deep workings; that the area of coal workable even with our present means is larger than has been estimated; that the magnesian limestone and new red sandstone beds are

likely to afford an opening for new stores of coal quite incalculable in amount; that the theory of an increase of consumption in a geometrical ratio is not tenable; and that we shall probably economize consumption in future years by the adoption of new processes, new furnaces, new stove-grates, smoke-consuming apparatus, and the utilization of waste heat and gases. Although entertaining these favorable views, he nevertheless suggested official inquiry. The government assented; and a Royal Commission, comprising the Duke of Argyle, Sir Roderick Murchison, Sir W. G. Armstrong, Mr. Vivian, Mr. Prestwich, Dr. Percy, Mr. Jukes, Mr. Robert Hunt, and several other experienced men, was appointed in July 1866.

The Coal Commissioners gradually collected a large body of information concerning the quantity of coal raised annually in the United Kingdom; the probable future rate of increase; the quantity still remaining at available depths underground; and the best means of economizing coal in future. They obtained a great mass of evidence, which was published in 1871, with maps, plans, and diagrams. They reported that the deepest of our mines are about 2000 feet, but that 4000 feet might possibly be worked with improved lifting and ventilating appliances. 'They estimated the coal of the United Kingdom, at all depths down to 4000 feet, at 90,207 million tons—viz., 46,000 millions in England; 34,000 millions in Wales; 10,000 millions in Scotland, and a mere trifle in Ireland. The largest single coal-field they found to be that of South Wales, 32,000 million tons. With deeper deposits, the total was 146,480 millions of tons. Later calculations are given by Dr. Edward Hull in his *Coalfields of Great Britain* (4th ed. 1881). He has corrected the estimates of the Commissioners down to 1880, and obtains the following results for the visible coal-fields: In England and Wales, 69,216 millions of tons; in Scotland, 9643; in Ireland, 150; total, 79,009 millions of tons. The summary by Professor Ramsay of the probable amount of coal under Permian and other formations, at a depth of less than 4000 feet, with 40 per cent. deducted for loss and other contingencies, is upwards of 56,000 millions of tons, so that the total available coal in visible and concealed coal-measures amounts, according to this calculation, to 136,000 millions of tons, a supply which Dr. Hull thinks would be sufficient to last for more than a thousand years.

The coal-harvest of Great Britain in 1872 was 123,000,000 tons; in 1873, 127,000,000 tons; and in 1880, 146,818,622 tons, or an increase of 12 millions of tons upon the previous year. The value was £62,395,000; the number of collieries, 3880.

COAL-TAR. See GAS-TAR.

CO'AL-WHIPPING, the name given to a mode of unloading coal from vessels at anchor in the Thames. About 2,000,000 tons of coal are annually transferred from vessels in the river to barges, which convey them to the wharves. The operation is called C., and the men, *coal-whippers*—names, the origin of which does not seem to be known. The men work in gangs of nine—a *basket-man* and eight others. Some of them shovel the coal from the hold of the ship into baskets or boxes; some haul up the boxes by ropes and pulleys; and some empty the contents into the barges.

This is all the operation—a mere example of muscular labor of the coarsest kind. It would not have called for notice in this work, had not legislative interference given a factitious importance to it. Some years ago, when the number of these men was about 2000, public-house keepers got into the habit of acting as middlemen, a position which gave them the power of compelling the men to spend nearly all their earnings in drink. The trade fell into such a state, that the men were virtually slaves to the publicans. They asked for the interference of the legislature; and this was granted in 1843. An act was passed expressly for these 2000 coal-whippers. A Coal-whippers' Board was formed, comprising members named by the Board of Trade, others named by the Corporation of London, and one by the Shipowners' Society. This Board assumed the functions of a middleman or master coal-whipper; contracted for the whipping of ships of coal, and employed the men. No one but men registered on the books of the Board was allowed to work on the Thames as a coal-whipper, with the exception of the crews of the ships and the servants of the coal-owners. This exceptionally-protected trade was maintained on the same basis by other acts passed in 1846 and 1851. In 1856, however, a further renewal was refused; and a committee of the House of Lords, in 1857, while sympathizing with the men, declined to recommend any further special legislation for them. The coal-owners agreed with the Board of Trade to maintain a Whipping Office, to give the men a refuge from the publicans, but without interfering with the liberty of coal-shippers to employ whom they pleased; and this plan has since been acted on. The office is at the Coal Exchange, with a men's rendezvous near Ratcliff. The necessity for coal-whippers has been much lessened of late years by the use of a floating derrick in the Thames, by which the contents of a coal-ship can be transferred to the barges in a few hours by steam-power.

COA'MINGS, in a Ship, are small frameworks on the deck, to prevent sea and rain water from running down the hatchways, ladder-ways, and scuttles.

COA'NZA, a river of Lower Guinea, Western Africa, which, after a course of about 500 or 600 miles, enters the Atlantic south of St. Paul de Loando, in lat. about 9° 10' S. It is navigable for a considerable distance, but a bar at its mouth renders it inaccessible save to small vessels.

COA'ST-GUARD, an organization formerly intended to prevent smuggling merely, but now constituted so as to serve as a defensive force also. The old coast-guardsmen were in the employment of the Customs department; they were posted along the shore at spots commanding extensive views of the beach, and were expected to be always on the look-out for smugglers. In 1856, the C. was transferred to the Admiralty, and under this arrangement, the Admiralty may, from time to time, issue orders for the augmentation of the C., not to exceed 10,000 men in all. Lands, not exceeding three acres each, may be bought by the Admiralty for C. stations. The coasts of the United Kingdom have been divided into 11 districts. Each district is under a navy captain, who has an iron-clad guard-ship at some port in the district. All the revenue cruisers and defence gun-boats are attached as tenders to the ships, and are manned therefrom. The able seamen, borne on the ships' books, and employed on shore in C. service, are in three classes—chief boatmen, commissioned boatmen, and boatmen. They receive high sea-pay, besides 1*s.* 4*d.* per day in lieu of provisions, and house-rent and medical attendance free. In war-time, all of these men may be called upon to serve as regular sailors on board ship, but their families are allowed to live rent-free during this time. The C. are taught naval gunnery, gunboat exercise, and the serving of land-batteries. The guard-ships are also employed as training-ships for the navy. The whole of the C. comprised, in 1880, 4000 men; and the charge for their maintenance and that of their ships is about £460,000.

COAST VOLUNTEERS, or ROYAL NAVAL COAST VOLUNTEERS, was a corps organized for the special defence of the coasts of the United Kingdom, separate from, but in connection with the Coast-guard (q. v.). By an act of parliament passed in 1853, the Admiralty was empowered to raise a number, not exceeding 10,000, of C. V., to consist of seafaring men and others, to be entered for five years' service, and to be exercised 28 days in each year, either on shipboard or on shore; but not to be sent more than 50 leagues from the coasts of the United Kingdom, unless in cases of emergency, when the distance might be extended to 100 leagues. One year's active service entitled them to discharge in ordinary cases. Their pay and rank during exercise and active service were the same as able seamen's. An act passed in 1875 invested the command of the C. V. in the Coast-guard, the officers of which were to superintend the training and exercising. As a matter of fact, the force was always a very small one and a failure; and it was ultimately abolished. Its place may be regarded as having been amply filled by the Royal Naval Reserve (see NAVAL RESERVE), 20,000 strong; and to some extent by the Naval Artillery Volunteers (see VOLUNTEERS), a new force established in 1873.

COASTING-TRADE, the commerce carried on by sea between the different ports of the same country. In Great Britain, 'coastwise' is defined to mean 'from any one part of the United Kingdom to any other part thereof.' Vessels engaged in this commerce are subject to different rates and regulations from oversea traders, and the masters must keep books showing that their cargoes come strictly within the definition of coasting-trade. Formerly, no goods or passengers were allowed to be carried from one part of the United Kingdom to another, except in British vessels; but this restriction was repealed in 1854, and the C. of Great Britain is now open to all the world. In other countries, the exclusive policy still prevails. The regulations under which the C. are conducted are contained in the Customs Consolidation Act, 16 and 17 Vict. c. 107 (see M'Culloch's *Commercial Dictionary*).

COAT OF ARMS, in the military trappings of the middle ages, held the place of the *paludamentum* of the ancient Roman captains. It was a coat worn by princes and great barons over their armor, and descended to the knee. It was made of cloth of gold or silver, of fur or of velvet, and bore armorial insignia. The 'coat of arms,' as understood by heraldry in the present day, is nothing more than a relic of the ancient armorial insignia, divested of the coat on which it used to be embroidered. See SHIELD, HERALDRY.

COAT OF MAIL, in the armor of the middle ages, was a suit made of metal scales or rings, linked one within another. See ARMOR.

COA'TBRIDGE, a rising and prosperous town of Scotland, in the parish of Old Monkland, about eight miles directly east of Glasgow, on the Monkland Canal and Caledonian Railway. The

town is straggling, has some good houses, and a number of small villages or suburbs on its outskirts. There are six churches besides the parish church, two academies, and several other schools, banks, &c. The town is in the center of a mineral district, is surrounded by about fifty smelting-furnaces, and contains eight malleable iron works, one tin-work (the only one in Scotland), and several other works connected with the iron manufacture. C., owing to the great increase in the iron trade, has grown very rapidly in size and prosperity within the last 30 years. Pop. (1841) 1599; (1851) 8564; (1861) 10,501; (1871) 13,802; (1881) 17,500.

CO'ATI, or COATI-MONDI (*Nasua*), a genus of quadrupeds of the family *Ursidæ* (the Bear family); by some naturalists referred to *Viverridæ* (the Civet family), although their *plantigrade* character allies them rather to the former. They are most nearly allied to the racoons, and, like them, are exclusively American. They are chiefly remarkable for the elongation of the snout, which is a sort of flexible proboscis, and is turned about in search of food, and employed in rooting up the earth to obtain worms and insects. They are often domesticated in South America, and are very affectionate, active, troublesome, and amusing.

CO'BALT (from *Cobalus*, a malicious sprite or gnome) is a metal of no use in the arts and manufactures, but which forms compounds of commercial importance. C. (symbol Co) is found naturally in combination with arsenic (As) as *Speiss* (CoAs); in combination with arsenic and sulphur, as *C. Glance*, the arsenide and sulphide of C. (CoS_2,CoAs), in ores of Nickel (q. v.); and in the metallic state, it is found in meteoric stones or Aërolites (q. v.). The metal had been obtained in laboratory experiments, and presents a gray color with a reddish tinge, is highly magnetic, and is as hard and infusible as iron, It is a brittle metal, and forms no alloys of commercial use. The protoxide of C. (CoO) is employed in painting on porcelain, for producing a rich blue color. *Zaffre* is the impure oxide obtained by partially mixing C. ore with two or three times its weight of fine sand. *Smalt* is the term applied to the deep blue glass, which owes its color to the presence of oxide of C., and which, when reduced to very fine powder, is employed occasionally by laundresses to correct the yellow color of newly washed linen, and by paper-makers as a blue pigment for staining writing paper. Smalt is also used in the production of of the blue colors in porcelain, pottery glass, encaustic tiles, fresco-painting, &c., and forms the principal ingredient in *Old Sevres Blue*, *Thenard's Blue*, *Turquoise Blue*, and *Variegated Blue*. See BLUE. A compound containing the oxides of C. and zinc is of a beautiful green color and is known as *Rinman's Green*. The chloride of C., dissolved in much water, may be employed as a sympathetic ink. In dilute solutions, it is of a faint pink color, which is not observable when it is used for writing upon paper; but when heated before the fire, it loses water, and becomes blue, and the writing is then capable of being read. On allowing the paper thereafter to lie in a damp place, or exposing it to the vapor or steam from a kettle, water is again absorbed and the writing returns to its invisible state. The addition of a little perchloride of iron to the ink, makes the writing appear green; a solution of zinc imparts a red tint; and a salt of copper, a yellow shade.

COBA'N, a town of Central America, Guatemala, in the dep. of Vera Paz, in a fertile valley on the Rio Dolce, 55 miles north of the town of Guatemala. The inhabitants are nearly all Indians, are generally industrious and some of them wealthy, and possess plantations of sugar-cane, bananas, pimentos, and various kinds of fruit-trees. Pop. estimated at 14,000.

CO'BBETT, WILLIAM, a celebrated English political writer, was born in March 1762, at Farnham, in Surrey, where his father was a small farmer. From his infancy, he was trained in habits of industry and self-dependence. Taking a dislike to rural occupations, he went to London, where he was employed a few months as a copying-clerk—a kind of employment so distasteful to him, that he enlisted into the 54th Foot, and with it went out to Nova Scotia shortly after. In this regiment he remained about eight years, in the course of which time his uniform good conduct, activity, and intelligence, had secured him the high promotion of sergeant-major. During his soldier-years, he indulged in none of the dissipations common to barrack-life, but devoted the whole of his leisure to the work of self-education. On his return to England about the end of 1791, he obtained his discharge, married, and went to America in the following year. He settled in Philadelphia, where he commenced his career as a political writer. Under the signature of 'Peter Porcupine,' he was at this early stage as keen a Tory as in later life he was a Radical, and he lashed French republicanism and American democracy with a scorn as coarse and personal sometimes as it was always bitter. In America he was twice prosecuted for libel. He left America in June 1800, and returned to England. In January 1802, appeared the first number of his famous *Weekly Political Register*, which he continued without intermission until his death in 1835. At first, Tory, the *Register* gradually changed its politics, until at last it became the most fierce and determined opponent of the government, then presided over by Pitt, and the most uncompromising champion of Radicalism. In 1810, having previously been twice tried and found guilty of libel on certain members of the government, he was sentenced to imprisonment for two years in Newgate, and to pay a fine of £1000, for having in the *Register* made some severe remarks upon the flogging of five militiamen. In 1817, in consequence of pecuniary embarrassments, and the dread of being sent to Newgate again, under the Six Acts for the suppression of freedom of discussion, C. went once more to America, where he remained more than two years, his articles for the *Register* being transmitted with unfailing regularity across the Atlantic. In 1829—1830, C. delivered political lectures in several of the principal towns of England and Scotland, and everywhere met with a most enthusiastic reception as the boldest and most powerful advocate of the people's rights. In 1832 he was returned to the first reformed parliament as one of the members for Oldham. His speeches in parliament, however, did not add to his reputation.

He died June 18, 1835. Among C.'s best known works are his *English Grammar*, *Rural Rides*, *Cottage Economy*, *Advice to Young Men and Women*, and *Parliamentary History*. C. was by no means a man of the first order of intellect; he was shut out altogether from the higher and more refined departments of human thought. But in dealing with matters of common sense merely, he exhibited a native vigor far surpassing that of any writer of his day. Nor can there be any doubt that, in spite of his crotchets, he rendered lasting service to the cause of the people. See Smith's *Life of C.* (1878).

CO'BDEN, RICHARD, an eminent English politician, who was very aptly designated 'the Apostle of Free Trade,' was born at Dunford, near Midhurst, Sussex, 3d June 1804. His father, who was the owner of some little property, which he cultivated himself, died while the subject of this article was yet young, leaving his family in comparatively poor circumstances. Richard was received into a wholesale warehouse belonging to his uncle, where he soon exhibited great aptitude for business. After some time, he became a partner in a Manchester house, his presence here being speedily made manifest by the superior quality and tastefulness of the printed calicoes of the firm. In 1834—1835, C. traveled in Turkey, Greece, and Egypt, and also visited the United States, the result of his travels appearing in two pamphlets, entitled respectively *England, Ireland, and America*, and *Russia;* the latter intended as an antidote against the 'Russophobia' then prevalent. In these pamphlets, he also ridiculed the workings of diplomacy, and asserted England's mission to be the avoidance of war and the extension of commerce. In 1837, he contested unsuccessfully, on free-trade principles, the borough of Stockport; and in 1838 he carried in the Manchester Chamber of Commerce a motion to petition parliament for the repeal of all duties on corn. This was followed by similar action all over the country; and in the following year, petitions bearing some two millions of signatures for the repeal of the corn-laws were carried to London by 200 delegates. The motion of Mr. Villiers for repeal being rejected by a large majority of the House of Commons, the friends of free trade determined to form the Anti-corn-law League (q. v.), of which C. became the most active and prominent member. To his lectures all over the country, and his speeches in parliament (to which he was returned in 1841 by the constituency which rejected him in 1837), all characterized by great information, clearness, and acute and convincing reasoning, was in great part due, as Sir Robert Peel acknowledged, the abolition of the corn-laws at so early a period as 1846. Having accomplished this great work, C. again visited the continent, and during his absence he was elected both for Stockport and the West Riding of Yorkshire.

He chose the latter constituency, which he continued to represent till 1857, when, on an appeal to the country by Lord Palmerston to support him in his Chinese policy, of which C. was a strenuous opponent, he was rejected. Shortly after the repeal of the corn-laws, the public testified its gratitude to him for the services he rendered in this matter by subscribing for him a magnificent testimonial of between £60,000 and £70,000. C. now gave up business, and devoted himself exclusively to politics. He continued to labor assiduously for the extension of free-trade principles, for parliamentary and financial reform, for repeal of the taxes on knowledge, and was particularly earnest in enunciating national and international peace views; and to this feeling with regard to war, he owed his rejection at the general election of 1857. In 1859, having in the interval, on account of ill health, retired from politics altogether, he was, during his absence in America, elected for Rochdale. Lord Palmerston, who was at this time called upon to form a new ministry, with a just appreciation of the great services which C. had rendered to his country, offered him a seat in the cabinet, which C., as the uncompromising opponent of the noble lord's foreign policy, felt bound to decline.

After his election for Rochdale, the state of his health did not permit him to take any part in parliamentary proceedings, but as her Majesty's plenipotentiary, he (1859—1860) arranged and concluded a treaty of commerce with France. C. spoke out strongly in favor of the North, during the American civil war. He died April 2, 1865. See his *Life* by John Morley (1880).

COBI'JA, a town of Bolivia, claims notice chiefly as being the only seaport of the republic. It is situated in lat. 22° 34′ S., long. 70° 21′ W., and forms the capital of the department La Mar. Its population is less than 3000, and its trade inconsiderable, for, besides the disadvantage of an open roadstead, to seaward, there extends inland the almost impracticable desert of Atacama. Hence most of the maritime commerce of the state (see BOLIVIA) passes, and that in the face of transit-duties, through the Peruvian harbors to the northward.

COBI'TIS. See LOACH.

CO'BLE, or CO'BBLE, is a low flat boat with a square stern, mostly used by salmon-fishers.

COBLENZ, a city of Rhenish Prussia, beautifully situated at the junction of the Rhine and the Moselle, the former of which is here crossed by a bridge of boats, and the latter by a fine stone bridge. Being a bulwark of Germany against France, C. is defended by extensive fortifications, forming a fortified camp capable of affording accommodation for 100,000 men. For defence-purposes, C. is connected with the almost impregnable castle of Ehrenbreitstein (q. v.), on the opposite side of the Rhine. Several detached forts also guard the city at various points. In the old town of C., many of the streets are irregular, narrow, and dirty; but in the new town they are generally well built, moderately wide, and cleanly.

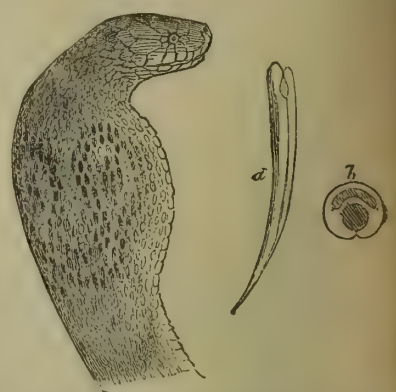
Among its principal buildings are the Church of St. Castor, founded early in the 9th c.; the town-hall; the old castle of the Electors of Treves, repaired in 1845; and the old Jesuit College, now a *gymnasium*. The favorable position of C. secures it an active commerce in wine, corn, mineral waters, &c. It manufactures champagne, cigars, japan-ware, and furniture. Many of the inhabitants are employed in vine culture. Pop. (1880), with Ehrenbreitstein and a garrison of 4600, 36,240. C. was known to the Romans as *Confluentes*. Till 1796, it belonged to the Elector of Treves. In 1798 it was made the capital of the new French department Rhine-Moselle, and in 1815 was given to Prussia.

CO'B-NUT, a name given to some of the largest and finest cultivated varieties of the HAZEL-NUT (q. v.)—In the West Indies, the name C. is given to the fruit of *Omphalea triandra*, a tree of the natural order *Euphorbiaceæ*. It is also called Hog-nut. The tree has a white juice, which turns black in drying, and in Guiana is used instead of ink. The fruit is a three-celled capsule, each cell containing one seed or nut, which, if the embryo is retained, has very cathartic properties, but after its extraction, is wholesome and pleasant.

CO'BURG, a town of Central Germany, in the duchy of Saxe-Coburg-Gotha, picturesquely situated on the left bank of the Itz, a tributary of the Regen, in lat. 50° 15′ N., and long. 10° 58′ E. In the market-place are some striking old buildings, but the general appearance of the houses is one of cleanliness and comfort. C. is one of the chief ducal residences, and the palace, a Gothic edifice, erected in 1549, is one of the principal buildings in the town. The old castle of the Dukes of Coburg, now partly used as a house of correction and prison, occupies a commanding height more than 500 feet above the town. The rooms, and the bed which Luther occupied when in concealment here in 1530, are still exhibited to the visitor, as well as the pulpit from which he preached in the chapel of the castle. During the Thirty Years' War, the castle was ineffectually besieged by Wallenstein. C., which is the seat of all the high courts of the duchy, has manufactures of woollen, linen, cotton, marquetry, baskets, porcelain, furniture, and carriages, and exports beer. Pop. (1880) 15,791.

COBRA DA CAPELLO ('hooded snake'), the Portuguese name of *Naja tripudians* (sometimes extended to the whole genus *Naja*), very venomous serpents of the sub-order *Colubrina*, remarkable for the faculty of dilating the back and sides of the neck, which they do when excited. The dilatation depends on the length of the ribs from the head to the tenth vertebra; when at rest, these ribs are directed backward, but spread out the integuments of the neck when drawn forward and arranged horizontally. It is usually three or four feet long, of a pale rusty-brown color above, and bluish or yellowish-white below, and is characterized by a singular mark on the back of the neck, closely resembling the figure of an old fashioned pair of spectacles, from which the animal sometimes receives the name of the *Spectacle Snake*. The C. da C. preys on lizards and other small animals. It is usually a sluggish creature, and is easily killed, even by means of a small stick or whip. Its venom is extremely powerful, its bite causing death in two hours or less. Yet it is little disposed to use its fangs, except for the purpose of providing itself with food. The C. da C. is often to be found in the vicinity of human dwellings in the East Indies, and even in the houses themselves, attracted apparently by the young of the domestic poultry, and by the moisture of the wells and drainage. When one is found in or near a house, its mate is seldom far off. The Singhalese, when obliged to leave their houses in the dark, carry a small stick with a loose ring, the noise of which, as they strike it on the ground, warns the snake to leave the path.

The poison of the C. da C. is secreted in a large gland in the head of the serpent, which, when the animal compresses its mouth upon any object, flows through a cavity of the tooth into the wound. The poison, though most deadly when introduced into the system through a wound, possesses the curious property of being perfectly harmless if taken internally. Olive oil applied externally, and ammonia taken internally, cauterizing, and ligatures immediately applied, may save the life; but the poison is so deadly, that instances of recovery of bitten persons are very rare. See Buckland's *Curiosities of Natural History*, and Fayrer's *Thanatophidia of India* (London: Churchill). The other species of *Naja* are found in the warm parts of Asia, Africa, and Australia.



Head and Neck of Cobra, showing the Hood: *a*, fang of Cobra; *b*, transverse section.

COBURG PENINSULA, the most northerly part of Australia to the west of the Gulf of Carcentaria, runs out in a north-west direction towards Melville Island, from which it is divided by Dundas Strait. On its north-east side is the bay, known as Port Essington, at the head of which, about lat. 11° 22′ S., long. 132° 10′ E., was established in 1839, the settlement of Victoria—abandoned, on account of its insalubrity, six years thereafter.

CO'CA (*Erythroxylon Coca*), a shrub of the natural order *Erythroxylaceæ*, of which the leaves are much used by the inhabitants of Peru and Bolivia as a narcotic and stimulant. The dried leaves are chewed with a little finely powdered unslaked lime, or with the alkaline ashes of the quinoa (q. v.), or certain other plants. An infusion is also occasionally used. The properties and effects of C. resemble those of opium, although it is less narcotic, whilst it possesses the property of dilating the pupil of the eye, which opium does not possess. It also lessens the desire for ordinary food, and for some time, at least, enables the person who uses it to endure greater and more protracted exertion than he otherwise could, and with less food. It is especially remarkable for its property of preventing the difficulty of respiration, so common in the ascent of long and steep slopes at great elevations. But when used habitually and in excess, it weakens the digestion, produces biliary and other disorders, and finally induces a miserable ruin both of body and mind. It has been in use from a very remote period among the Indians of South America, and was extensively cultivated before the Spanish conquest. Many of the Indians of the Peruvian Andes are to this day excessively addicted to it, and its use is quite general among them, besides prevailing to a considerable extent among the other inhabitants of the same regions. Its culture and use have extended into Brazil and the countries on the banks of the Amazon, and it is supposed that about 30,000,000 lbs. of the dried leaf are consumed in a year, about 10,000,000 of the human race partaking in the indulgence.

COCCE'JI, HEINRICH FREIHERR VON, born at Bremen, March 25, 1644, studied jurisprudence and philosophy in Leyden from 1667 to 1670, and went from thence to England. In 1672, he was made professor of the law of nations at Heidelberg; in 1689, he accepted the professorship of jurisprudence at Utrecht; and, in the following year, was appointed to a similar office at Frankfort-on-the-Oder. In 1713, the emperor named him a baron of the realm, on account of his good management of several important affairs. C. died August 17, 1719. As an erudite jurist, C. was the oracle of many courts, and his work on German civil law (*Juris publici prudentia*, 1695) was almost universally used as an academical text-book for this branch of jurisprudence.—His youngest son, SAMUEL, born at Heidelberg in 1679, acquired no less renown. He, too, in 1703, became professor at Frankfort-on-the-Oder, and afterwards filled several honorable state-offices. At last, he was appointed great chancellor, in which function he died, October 22, 1755. His reform of the Prussian administra-

tion of justice, and his *Codex Fridericianus* (Berlin, 1747—1750), are among the greatest benefits his country owes him.

COCCE'JUS, or COCK, JOHANNES, a distinguished theologian, was born at Bremen, August 9, 1603. After preparatory studies in his native place, he, in 1625, went to Hamburg, where he studied Hebrew. From thence he went to Franeker in 1629. Returning to Bremen in 1630, C. was appointed professor of Hebrew at the Athenæum of his native place; called to Franeker for the same office in 1636, and in 1643 appointed professor of theology also. In 1650 he became professor of theology at Leyden, where he died in 1669. C.'s chief work is the *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (Leyden, 1669) the first tolerably complete dictionary of the Hebrew language. The irrelevant and inaccurate matter which it originally contained, has been weeded out in the course of time by more skilful editors. In spite of his great learning, C. held very peculiar hermeneutical principles, which enabled him to discover the whole New Testament in the Old. The result, of course, was that he virtually transferred the language of the Old Testament to the New. The representation abundantly employed in the former of a covenant between God and man, usurped the place of the New Testament doctrine of the Fatherhood and Sonship; and his theology is simply a modern renewal of the old attempt to Judaise Christianity, which Paul denounced and condemned. C. carried the covenant theology, as it is called, to an absurd extreme. The most complete exposition of his views is in his *Summa Doctrinæ de Fœdere et Testamento Dei* (1648). C.'s principal antagonists were Voetius and Desmarets.

COCCINE'LLA. See LADY-BIRD.

CO'CCO, CO'COA ROOT, or E'DDOES, plants of the genus *Colocasia*, and of the nearly allied genus *Caladium*, of the natural order *Araceæ*, very generally cultivated in tropical and sub-tropical countries for their roots, or flat underground corms, which abound in starch, and are used as articles of food, being deprived by roasting or boiling of the characteristic acridity of the order, which, indeed, some of them possess in a comparatively small degree. They are sometimes included under the name *Yam*, but are totally different from the true yams. The names Cocco, Cocoa Root, and Eddoes, perhaps more strictly belong to *Colocasia antiquorum*, a stemless plant with ovate leaves, and flowers enclosed in a cylindrical erect spathe. The taste of its roots is like that of potatoes. *Colocasia esculenta* is a similar plant, a native of tropical America, and is much cultivated. *Colocasia macrorhiza* is the Tara (q. v.) of the South Sea Islands. In the Himalaya, *C. Himalensis* forms the principal food of many of the inhabitants. The root in its recent state is stimulant, diaphoretic, and expectorant.

COCCOLOBA. See SEASIDE GRAPE.

COCCOMI'LIA, or COCUMIGLIA, (*Prunus coccomiltia*), a species of plum, a native of Calabria, and of which the bark—particularly of the root—is much used in that country for the cure of intermittent fevers. Its valuable qualities have been strongly attested by Neapolitan physicians, and it is employed both in private practice and in military hospitals, but it has not come into use in other countries. The C. has obovate leaves, short double flower-stalks, and an austere tawny-yellow fruit.

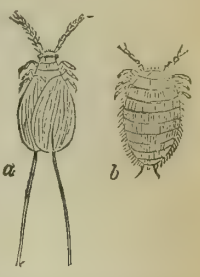
Coccosteus.

COCCO'STEUS, a genus of fossil fishes, peculiar to the Devonian measures. It was nearly related to Cephalaspis (q. v.), but differed in having, in addition to the bony helmet of that genus, a cuirass covering both the dorsal and ventral aspects of the body as far down as the origin of the dorsal fin, from which to the tail—comprising more than one-half the entire length of the animal—all seems to have been exposed without the protection even of a scale. In a well-preserved specimen in the British Museum, the remains of the endo-skeleton can be detected. Seven species have been described from the bituminous schists of the Old Red Sandstone of the north of Scotland.

COCCOTHRAU'STÉS. See HAWFINCH.

CO'CCULUS I'NDICUS, the name given commonly, and in the pharmacopœias, to a very poisonous seed, brought from the East Indies, which is used for various medicinal purposes, and illegally in the preparation of malt liquors. It possesses acrid and intoxicating qualities. It is used in India for stupifying fish, that they may be taken by the hand. An ointment made with it is a very efficacious remedy for ring-worm. It contains a most poisonous principle called *Picrotoxine*, whilst the pericarp contains another called *Menispermine*, equally poisonous. It is the seed of the *Anamirta Cocculus*, a beautiful climbing plant, of the natural order *Menispermaceæ*. It imparts to beer its bitter taste, and at the same time a fulness and apparent richness, but renders it very deleterious in its effects. It has been frequently asserted that C. I. is used to a considerable extent by British brewers, but according to the Report of the Laboratory Department of the Inland Revenue Office issued in 1876, there is little ground for this belief, as in no case were the officers of the department able to discover the drug in any brewer's premises, or in any samples of beer. Of the large quantity imported, almost the whole is again exported, chiefly to Germany.—The genus *Anamirta* is closely allied to the genus *Cocculus* (see CALUMBA), in which it was formerly included. The fruit of several allied species possesses properties analogous to those of the *A. Cocculus*.

CO'CCUS (Gr. *kokkos*, kermes), a genus of insects of the order *Hemiptera*, sub-order *Homoptera*, the type of a family, *Coccidæ*, allied to the *Aphis* (q. v.) family, although in many respects very distinct. The *Coccidæ* are sometimes called *Scale insects*, and by the French *gallinsectes* (Latinized by some entomologists into *Gallinsecta*), but they are not to be confounded with the insects called gall-flies (*Cynipidæ* or *Gallicolæ*), which produce *galls* or nut-galls. The *Coccidæ* are very numerous, and are attached to particular plants, on the juices of which they feed, often producing much mischief by the flow and loss of sap which their punctures occasion, and giving great trouble to gardeners, who find it very difficult to free their plants, particularly in hot-houses, from the *scale*, the *mealy bug*, the *vine-gall*, &c. Various washes, consisting of soap, sulphur, tobacco, &c., are employed for this purpose; but moist heat, or as much exposure to steam as the plant can bear, has been found in many cases the most efficacious remedy. The destructive Coffee-bug belongs to this family. The male *Coccidæ* are winged insects, having only two wings, which shut horizontally upon the body, the abdomen is terminated by two threads. The females are wingless. It is not well known how the males subsist, as they have no apparent organs for sucking juices or eating any sort of food. The females have a beak, which they insert into plants in order to suck their juices. This interesting family of insects contains not only many troublesome species, but some of which are of great value, particularly for the beautiful dyes which they yield. These dyes are obtained from the bodies of the female insects. Among them are Cochineal (q. v.) and Kermes (q. v.). A species of C. (*C. Polonicus*), which lives on the roots of the Knawel (*Scleranthus perennis*), yields the SCARLET GRAINS OF POLAND, a considerable article of commerce before cochineal was introduced into Europe; and a species which feeds on the roots of the burnet (*Poterium Sanguisorba*), was in like manner used by the Moors for dyeing silk and wool of a rose color. Other species produce Lac (q. v.) and Wax. See WAX INSECT.



Cochineal Insect (*Coccus cacti*); *a*, male; *b*, female.

COCCY'ZUS. See CUCKOO.

COCHABA'MBA, a name of various application in Bolivia.—1. A river which forms one of the head-waters of the Amazon.—2. A city on the foregoing river, lying 145 miles to the north-north-west of Chuquisaca, one of the chief cities of the Bolivian republic, and containing about 15,000 inhabitants. It has a temperate and healthy climate, and is engaged in the manufacture of cotton fabrics and glass wares.—3. A department, of which the city just described is the capital, in lat. 17°—19° S., long. 65°—68° W. With an area of 26,000 square miles, it has a population of about 380,000. In addition to the precious metals, it yields cotton, sugar, dyewoods, and timber.

CO'CHIN, a protected state of Hindustan under the presidency of Madras, lat. 9° 48′—10° 50′ N., long. 76° 5′—76° 58′ E. With Malabar on its N.W. and N., and Travancore on its E. and S., it fronts the Arabian Sea on the S.W., and meets Coimbatore towards the N.E. on the water-shed of the Western Ghauts. It contains 1361 sq. m., and (1881) 601,114 inhabitants. Its hydrography is singular. The Western Ghauts, which have here an elevation of fully 4000 feet, intercept the south-west monsoon, and render the coast one of the most humid regions in the world during June, July, August, and September; while even during the remaining eight months, anything like an unremitting drought is unknown. As the space between the mountains and the sea is almost on a level with the tide, the countless streams have each two contrasted sections—the plunging torrent that breaks into comparatively short pieces the magnificent trunks of teak with which it is freighted; and the sluggish brook which, however it may vary, according to the season, in breadth and depth, pretty uniformly results in a brackish estuary. Further, these estuaries, almost continuously breasted by a narrow belt of higher ground, form between them a backwater or lagoon of 120 miles in length, and of every width between a few hundred yards and 10 miles, which communicates at only three points with the ocean. The

cocoa-nut is the most valuable product of the country; besides this tree, however, the forests produce red cedar, anjelly teak, benteak, and many other hard woods, but these are now becoming very scarce. The low country produces rice, pepper, cardamoms, ginger, betel-nut, yams, arrow-root, and sweet potatoes. The population is peculiar in its composition, more especially as compared with that of the more easterly parts of the peninsula. The great mass of the population are Hindus, but there are also Mohammedans, and a large number of Christians and Jews. The Jews are classified into white and black; and the Christians, divided between the Syrian and Romish Churches, trace their origin partly to the Portuguese conquest, and partly to the missionary labors of St. Thomas the Apostle. Both the places of worship and the seminaries of education throw light on the relative numbers of the different parties. The latter, 95 in all, are—English, 5; Malayalam, 69; Tamul, 9; Mahratta, 1; Sanscrit, 7; and Hebrew, 4. The former are—Hindu, 2734; Mohammedan, 31; Jewish, 8; and Christian, 108.

COCHIN, once the capital of the principality above described, but now a seaport of the district of Malabar, in the presidency of Madras, stands in lat. 9° 58′ N., and long. 76° 18′ E., on the south side of the principal channel, between the open ocean and the backwater mentioned in the preceding article. As this lake, so to speak, is, even in its lowest state, always navigable for canoes, its value, as a means of communicating with the interior, can hardly be overrated in a country where roads and bridges are nearly out of the question. The harbor affords a depth of fully 25 feet; but there is a bar in front, which according to the latest survey, has only between 17 and 18 feet of water upon it. On this bar, during the south-west monsoon, the surf breaks so violently, that it is sometimes, but not often, impassable for vessels. Still C. is next to Bombay on this coast with respect to ship-building and maritime commerce. Here the Portuguese erected their first fort in India in 1503. They were supplanted by the Dutch in 1663—the epoch also of the transfer of Bombay to Charles II. In 1796, C. was captured by the British, and about ten years after, its fortifications and public buildings were destroyed, and its private dwellings very much damaged. Notwithstanding this check, the place continued to flourish; many merchant vessels, ranging upwards to 1000 tons, have been built; and, besides ships of war for the local navy, 3 frigates have been launched for the imperial service. The population of the city, numbering (1871) 13,588, is more heterogeneous than even that of the state of the same name, the additional elements being Dutch, Armenian, Arabian, and Persian. Its trade depends almost entirely on the produce of the cocoa-tree—viz., oil and cocoa fibre. Water is brought from a distance of 18 miles. Half a mile south is a town of the same name, in the native state of Cochin.

CO'CHIN CHI'NA, or ANA'M, an empire of Asia, occupying the greater part of the eastern portion of the Indo-Chinese peninsula. It lies in 10°—23° N. lat., and 102°—109° E. long., including Tonquin and Cochin China Proper. It is bounded, N. by China, E. by the Gulf of Tonquin and the China Sea, S. by Lower or French Cochin China, and W. by Laos, Siam, and Cambodia. Area, 200,000 sq. m.

Physical Features.—A mountain range of considerable height runs through the country, parallel with the coast. The northern province of Tonquin is an extensive plain, through which flows the river Song-ca. C. C. Proper extends along the coast between 11° and 18° N. lat. The largest river of Anam, and indeed of the whole Indo-Chinese peninsula, is the Meckhong or Cambodia, which, rising in the mountains of China, flows through Laos and Cambodia, and, after a course of some 1500 miles, separates into several branches, and finally discharges itself into the China Sea. The Song-ca, or Great River, of Tonquin, has an estimated course of 400 miles. The Hué, in C. C. Proper, flows through a fertile valley, and presents some of the finest scenery in Asia.

As to *climate* in Tonquin, the changes of temperature and weather are very sudden. Much rain falls in C. C. during the whole summer, which produces a general inundation about the end of October. September, October, and November are the best months of the year, and most suited to the European constitution.

Amongst the *agricultural productions*, rice, of which two crops are raised in the year, holds the chief place. Potatoes, peas, beans, melons, and other vegetables, maize, tobacco, cotton, indigo, tea, and sugar are also grown. Silk is produced in considerable quantities. Valuable trees, such as the calumba, ki-nam or scented eagle-wood, ebony, rose-wood, iron-wood, sandal-wood, the varnish-tree, and many others, flourish on the mountains. The palm-tribe and the bamboo are common in the low lands. The *mineral* riches of the country are very much neglected; but gold, silver, iron, copper, and coal exist, and are most abundant in Tonquin. The *domestic* animals are the elephant, Indian cow, buffaloes, pigs, goats, dogs, and cats. Fowls of that kind so lately a rage in this country, ducks, geese, and pigeons, abound in every village. The most dreaded of the *wild animals* of C. C. is the tiger. Elephants are very numerous in the forests of Tonquin; and leopards, wolves, bears, wild-boars, the rhinoceros, as well as many kinds of apes and monkeys, infest the mountainous districts. Serpents and other reptiles are to be met with in great numbers. Of *birds*, eagles, peacocks, quails, partridges, paroquets, and wild-ducks are amongst the most important. Fish of very excellent quality swarm in the rivers and canals. Very many are taken on the sea-coast, and carried to every part of the country.

Inhabitants.—The Cochin Chinese, like the other peoples of the Indo-Chinese Peninsula, are characterized by a Mongolian physiognomy and a monosyllabic language. They are rather low in stature, but well proportioned, hardy, and active. The women have a lighter skin, and are altogether better-looking than the men. Their dress is the old national costume of the Chinese prior to the Tartar conquest. The Cochin Chinese are greatly addicted to smoking, and betel-nut is the universal masticatory. The civilization of this people has been derived from China; hence their religion and government, manners and customs, nearly approximate to the creeds, administrative system, and habits of that country. The selection of a place of sepulture is with them a very grave consideration, and the good or bad fortune of a family is supposed to depend upon it. Rice, with a sauce called balachiam, made of macerated salt fish, is the principal food of the Cochin Chinese; but they are very unclean feeders, no flying or creeping thing, whether bat, insect, or reptile, coming amiss. The national drink is tea; but a liquor made from rice is also in use.

The common dwellings, which are raised two or three feet from the ground, are made of bamboo and thatch; but the better classes inhabit brick-houses roofed with tiles. Women in C. C. are allowed full liberty, and frequently engage in commerce and agriculture. They are kind to their children, and proud of a numerous offspring. Infanticide is unknown, but the poor sometimes sell the children they cannot afford to keep. Marriages are regulated by law; and before they can be contracted, the consent of the head of the family is required. Polygamy, or rather a system of concubinage, is allowed, but obtains chiefly among the rich. Divorce is also permitted. The laws against adultery are very severe, yet amongst single women little or no disgrace attends a breach of chastity. The law invests the creditor with the most arbitrary power over the property, wives, and family of his debtor. The population is estimated at 21,000,000.

Government and Administration.—These are after the Chinese model. The emperor is absolute, but he must govern according to the laws. He is assisted by a supreme council of high mandarins, seven of whom are his ministers. The government officials are divided into military and civil or literary mandarins. The former have the precedency; and from them the emperor selects his ambassadors, governor-generals, and viceroys. The learned and official language of the country is Chinese. For *administrative purposes*, the country is divided into provinces, departments, districts, and villages. A military governor or viceroy, and two high civil mandarins, reside at every provincial capital; and the minor divisions have each their regular number of officials, who are appointed by the supreme government. The laws are very arbitrary. The bastinado system is in full force; indeed, the bamboo may be regarded as a political and social institution. The mandarins, as a class, are described as very corrupt. The capital of the whole empire is Hué, or Huah. The foreign *commerce* of C. C. is carried on chiefly with China, the Portuguese settlement of Macao, Bankok, and Singapore. Cochin Chinese junks annually visit that port and the British Straits' Settlements.

History.—Previous to the Mongol invasion of China, Tonquin formed a part of that empire, but at that time it threw off its allegiance. The Anamitic sovereign now, indeed, acknowledges the emperor of China as his superior, yet his vassalage is little more than nominal. The present inhabitants of C. C. Proper are said to be descendants of political refugees from Tonquin. In 1774, a revolution in the former country deprived the reigning monarch, Ghialong, of his throne, but in 1790, assisted by some European adventurers, he not only re-established his power in C. C., but added Tonquin to his dominions. By a treaty in 1874, France guaranteed the independence of C., and obtained the opening of three ports to European commerce.—See Veuillot's *La Cochinchine* (1859); Bouillevaux's *L'Annam* (1875).

COCHIN CHINA, LOWER or FRENCH, a colonial possession of France in the southern extremity of the eastern portion of the Indo-Chinese peninsula. Lat. 9° 5′—10° N.; long. 105°—107° E. This territory was acquired after a war provoked by the continuous persecutions for many years of the Christians in his dominions by the king of Anam, and especially by the murder of several French and Spanish missionaries. After an invasion, the three provinces of Saigon, Bienhoa, and Mytho, together with the island of Pulo Condor, and a few others which lie off the coast, were taken pos-

session of in 1861. In 1867, a new treaty, formed after the repression of formidable hostile aggressions on the part of some of the natives, led to the annexation of other three provinces, thus completing the present colony of *Cochinchine française*. Area, 22,900 square miles (in four provinces, Saïgon, Mytho, Vinh-long, Bassac); population (1880) 1,597,013.

Napoleon III., in urging on the vigorous war policy which led to this acquisition, had in view the tradition that France had earlier claims to be satisfied, and other wrongs to be redressed, than those which induced him and the Spanish government to resolve on putting an end to the oriental monarch's persecuting cruelty. In 1787, Ghialong, king of Anam, in want of assistance to secure his throne, entered into a treaty with Louis XIV., by which he engaged, in return for French aid, to cede the town and harbor of Touran (Kwang-han), with its territory and two adjacent islands. The little active assistance afforded by France was effective; Ghialong was established on the throne, and added Tonquin and Cambodia to his dominions. The promises made to France were not fulfilled, but her missionaries were protected. Of three kings, each excelled his predecessor in persecuting the Christians, whether Europeans or natives, and in murdering the missionaries. The blood of the victims never ceased to flow till the sanguinary struggles which led to the establishment of the colony of Lower C. C. frightened the bloodthirsty potentates into toleration.

Cambodia, a level country to the north-west of French C. C., fertilized by the Mekhong, and formerly a sort of feudal dependency on Siam, was in 1864 declared independent under the protectorate of France. Extensive explorations in the interior of Cambodia have made us acquainted with stupendous monuments of an extinct civilization, rivaling those of Assyria and Egypt, but lost for ages amidst the dense forests. Remains of extensive cities and carved stone figures attest a unique culture, and justify the belief that some 2000 years ago the Cambodian empire was of enormous power and wealth.

Most of the monuments betray Buddhist influences; and the center of the empire lay without the present limit of Cambodia, where now wild tribes dwell on the borders of East Siam and west Anam. Apparently the subjects of the ancient empire were of the same stock as the present Cambodians, who, with European features and polysyllabic speech, are totally distinct from the surrounding Mongoloid populations, and seem to be of Caucasic stock. The national name of the Cambodians proper, as of the wild tribes adjoining, is *Khmer*. Latterly, the French have been making their influence more felt in the extreme north of the peninsula, and in 1882 occupied the capital of Tonquin (Tongking), the northernmost province of the Anamese empire.

Great exertions have been made by France to promote the prosperity of Cochin China, and to use its territorial influence in such a way as to acquire the good-will of the natives. But that the colony pays its own expenses has not been made clear; and the French do acknowledge that their new subjects are neither industrious nor commercial. Although the resources of the country are but imperfectly developed, rice is produced in considerable abundance; cotton, sugar, indigo, and tobacco are also cultivated. The dwarf mulberry grows freely; silkworms are reared with facility; hemp, the betel-nut, and the areca-nut are likewise grown.

CO'CHINEAL, a dyestuff employed in dyeing scarlet and crimson, and in the preparation of Carmine (q. v.) and Lake (q. v.).

C. consists simply of the bodies of the females of a species of *Coccus* (q. v.), called *C. cacti*, because it feeds upon plants of the *Cactus* family, particularly on one, therefore designated the C. plant, but known in Mexico as the NOPAL (*Opuntia cochinillifera*), figured in the article CACTEÆ. This plant is nearly allied to the prickly pear. It assumes a somewhat tree-like form. Its fruit, although eatable, is very inferior to that of the prickly pear. It is a native of Mexico and other warm parts of America, and is assiduously cultivated, in order to what may be called the cultivation of the valuable insect which it supports. This cultivation was carried on by the Mexicans long before the country was known to the Europeans. It is now carried on also in some parts of the West Indies, and in the island of Teneriffe. The C. plant and insect have been introduced into Algeria; but no considerable success has yet attended the attempts to introduce them into the East Indies, although the East India Company once offered a reward of £6000 for their introduction.—Other species of *Opuntia* appear to be as suitable for the C. insect as *O. cochinillifera*, particularly *O. Hernandezii*, which is employed in Mexico, and *O. Tuna*, which is chiefly used in Peru.

Cochineal or Nopal Cactus and Cochineal Insect.

The C. insect is a small creature, a pound of C. being calculated to contain 70,000 in a dried state. The male is of a deep red color, and has white wings. The female, which is wingless, is of a deep brown color, covered with a white powder; flat beneath, convex above. When a plantation of the C. plant has been formed—by cuttings which are ready to receive the insect in eighteen months—the cultivator (*nopalero*) procures branches laden with C. insects; and keeping the branches, of which their succulency admits, till the mother-insects have laid their eggs, he places their bodies, with the eggs which they cover, in little nests formed of some cottony substance upon the C. plants, and the young insects, when hatched, soon spread over them. The gathering of the C. is very tedious, and is accomplished by brushing the branches with the tail of a squirrel or other animal. The insects are killed by boiling water, by heating them in ovens, or by exposure to the heat of the sun. They must be speedily killed, to prevent them from laying their eggs, which diminishes their value. When killed and dried, they may be kept for any length of time without injury. The different appearances presented by C. as brought to market, are ascribed to the different modes of killing the insect. C. is one of the most important exports of Mexico.

CO'CHLEA. See EAR.

COCHLEA'RIA. See SCURVY-GRASS.

COCK, properly, the name of the male of the common domestic fowl (see FOWL), but very generally extended to the males of other kinds of gallinaceous birds, and not unfrequently employed as a distinctive appellation of the males even of some kinds of small birds.

The ancients regarded the domestic C. as the companion of Mars, and in heraldry he is the emblem of strife, of haughtiness, of quarrels, and of victory. Guillim has the following quaint eulogium on the cock: 'As some account the eagle the queen, and the swallow or wagtail the lady, so may I term this the knight among birds, being both of noble courage, and also prepared evermore to the battle, having his comb for a helmet, his sharp and crooked bill for a falchion to slash and wound his enemy; and as a complete soldier armed cap-à-pie, he has his legs armed with spurs, giving example to the valiant soldier to expel danger by fight, and not by flight. The cock croweth when he is victor, and giveth a testimony of his conquest. If he is vanquished, he shunneth the light and society of men!' The C. is said to have been the emblem of the ancient Gauls, who wore it on their helmets for a crest; and though the tradition does not rest on the authority of any medal or other monument, and is supposed to have been a mere play of words between Gallus, a cock, and Gallus, a Gaul, the C. was placed, after the Revolution, on the flags and ensigns of France.

As the emblem of watchfulness, the image of the C. was placed on the summits of church-steeples from a very early period. It is introduced by artists amongst the emblems of our Lord's passion, in allusion to St. Peter's sin, and for the same reason it is St. Peter's own emblem.

COCK DIVINATION, or ALECTROMANCY, is a method of divining in which a young white cock was made the principal actor. The plan pursued was to describe a circle, and divide it into as many equal parts as there are letters in the alphabet. Upon each of the spaces marked by its respective letter, a grain of corn was placed; and the letters from which the fowl picked the grains, when put together, formed the name of the person about whom inquiry was made.

COCKA'DE (Fr. *cocarde*, or *coquarde*). According to Wedgwood, the word signified originally a cocked-hat, or a hat with the broad flap looped up on one side, and was then applied to the knot of ribbon with which the loop was ornamented. Another view is, that it is derived from *coquart*, a beau, one fond of gay trappings. The word is now, however, restricted to signify an appendage to the head-dress worn as a military or naval distinction.

Badges of distinction were early had recourse to in party and civil warfare. A sprig of broom (*planta genista*) was the badge of the House of Plantagenet. In England, during the wars between the Houses of York and Lancaster, the adherents of the former party were distinguished by a white and the latter by a red rose worn in the cap.

The party organized at the court of Charles IX. of France to perpetuate the massacre of St. Bartholomew, recognized one another by a paper cross. The faction of the *Fronde*, opposed to Cardinal Mazarin, wore stalks of corn for the same purpose; and certain military bands were called *Lances vertes*, from decorating their lances with green twigs. The use of cockades, as marks of distinction in campaigns and battles, became very general about the beginning of the 18th century. Eugene and Marlborough gave the Germans, English, and Dutch, composing their army, a tuft of corn or grass as their signal or cockade. The use of the

C. began to be more fixed in the War of Succession. White being the color of France, and red of Spain, the two colors were united in the C. of the combined army. At last, in 1767, an authoritative regulation determined that every French soldier should wear a C. of white stuff; and in 1782, cockades were prohibited to all but soldiers. From this time till the Revolution, the C. was an exclusively military badge; and, both in France and England, 'to mount the cockade' was synonymous with becoming a soldier. But in the enthusiasm of 1789, the citizens of France generally assumed the tricolored ribbon as the badge of nationality and patriotism, which was soon also given to the army. The three colors were blue, white, and red: white had long been the color of France and its kings; the blue is understood to have come from the banner of St. Martin, and the red from the Oriflamme (q. v.).

Long before the Revolution, the three colors were used in combination; they were given by Henry IV. to the Dutch, when they desired him to confer on them the national colors of his country, and have ever since been borne by the Dutch Republic and kingdom of the Netherlands. At the Restoration, the white C. of the monarchy again took its place, but had to give way once more to the tricolor, which continues to be the C. of the French army.

Black, with some distinction, enters into the cockades of the German nations. The Austrian is black and yellow; and the Prussian black and white, abandoned for the black, yellow and white of the German Empire. After the German war of liberation in 1813, a national C. of black, red, and gold came into general use, and was afterwards assumed by the military and by officials. The wearing of these German cockades was prohibited in 1832 by a resolution of the German Diet; but in 1848 they were again introduced not only by patriots as a badge of German union, but into the armies. The national colors of Belgium are black, yellow, and red. Cockades of these colors were worn by almost the whole population of Brussels on occasion of the constitutional festival, July 21, 1860. Cockades of green, white, and red are worn in Italy.

The continental C. is generally in the shape of a flat disk, sometimes of metal, sometimes of silk, or other stuff, with the colors disposed concentrically.

In England, the badge of the Stuarts was a white rose; and after the expulsion of the family, the white C. became the distinctive mark of the adherents of the exiled family, in opposition to the orange of Nassau and the black of Hanover; it is a favorite theme in Jacobite songs. The black C., to be seen on the hats of many gentlemen's servants, was unknown in Britain till the accession of the House of Hanover, and was then introduced by George I. from his German dominions. It seems to be understood that the right to use it belongs to naval and military officers, and the holders of some offices of dignity under the crown, including privy councillors, officers of state, supreme judges, &c. It is difficult to know where the line should be drawn, as the privilege is one of which the law takes no cognizance. It is often maintained that the distinction belongs to deputy-lieutenants, but it can hardly be supposed to extend to officers of volunteers.

COCKATOO' (*Plyctolophus*), a genus of birds of the parrot family, or *Psittacidæ*, distinguished from parrots by the greater height of the bill, and its being curved from the base, and by the lengthened broad, and rounded tail. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed feathers, with their tips directed forwards, which can be erected and expanded like a fan or depressed at the pleasure of the bird. The true cockatoos are also all of generally whitish plumage, but often finely tinged with red, orange and other colors, or mixed with these colors in more brilliant display.

But the name C. is also commonly extended to nearly allied genera, as *Calyptorhynchus* and *Microglossus*, in both of which the plumage is generally dark, and to which belong the *black cockatoos* of Australia and of the Indian archipelago. The genus *Microglossus*, to which belongs the Great Black C., or Giant C. of New Guinea, is remarkable for the structure of the tongue, which is cylindrical, tubular, capable of being greatly protruded from the mouth, and terminates in a cloven horny tip. All the cockatoos are natives of the regions already named. They abound in Australia. They live not only on fruits and seeds, but partly on insect larvæ. Some of them are frequently to be seen in confinement in Europe, particularly the Lesser Sulphur-crested C. (*Plyctolophus sulphureus*), which, although of comparatively tame plumage, is a general favorite on account of its docility. None of the cockatoos learn to speak many words. Their name is derived from their own proper cry.

CO'CKATRICE, one of the fabulous monsters, a belief in the existence of which prevailed among the ancients and during the middle ages. It was sometimes distinguished from, and sometimes identified with, the basilisk. It was always regarded as possessing similar deadly powers. Its monstrous generation has already been noticed in the article BASILISK. For protection against it, travelers in Africa are said to have carried with them its relative, the cock, the crowing of which caused it instantly to expire. The word C. is sometimes used in the English version of the Old Testament. Perhaps all that can safely be affirmed of the meaning of the original Hebrew, is that it is the name of a venomous serpent. In heraldry, the C. is an imaginary monster, with the wings of a fowl and the tail of a serpent.

CO'CKBURN, HENRY, a Scottish advocate and judge, was born at Edinburgh on October 26, 1779. At the age of eight, C. began attendance at the High School of Edinburgh, but exhibited no indications of extraordinary abilities. Sent to the university of Edinburgh at the age of fourteen, his powers began to develop themselves; and though never distinguished as a student, he became the companion of men like Brougham, Horner, and Jeffrey, from whom he imbibed liberal opinions, greatly to the annoyance of the hereditary Toryism of his family. He was called to the Scottish Bar in 1800, and after seven years spent in becoming patience, according to the manner of his profession, he was appointed, by his relative Lord Melville, one of the advocates whose duty it is to assist the Lord Advocate in the prosecution of criminal offenders.

Though the appointment was conventionally a political one, and though the party to whom C. was opposed was then in power, he was persuaded to hold the office, as it had in itself really nothing of a political character, upon the understanding that his own views were not to be compromised. It was expected, however, that he would give up his liberalism; and when this expectation was disappointed, advantage was taken, about four years after, of some trivial excuse to dismiss Cockburn. Not till the introduction of jury trial in civil causes into Scotland in 1816, did C. find opportunity for remunerative professional employment. His powers were better adapted for success with a popular, than with a professional tribunal. Extremely simple, clear, and impressive, at times humorous, at times pathetic, always unaffected, and, when he pleased, eloquent, he urged his side of the question with so much earnestness and candor, that the effect was almost irresistible. Under the Grey ministry of 1830, he was appointed Solicitor-general for Scotland; and four years later, he was made one of the judges of the Scottish supreme civil and criminal courts, and took, according to the Scottish custom, the title of Lord Cockburn. He died 26th April 1854, at his residence of Bonaly, in the neighborhood of Edinburgh.

The efforts of C. as an author were not numerous. He contributed to the *Edinburgh Review* a few articles, having, it would seem, chiefly a temporary interest. Those upon Scottish law reform are known to have had considerable influence in producing the changes desired. Late in life, he undertook, at the request of Jeffrey's executors, the life of his beloved friend. This work was published in 1852. C. will be best remembered by the *Memorials of his Time*, which appeared posthumously in 1856. It is a kind of autobiography, into which have been interwoven numerous anecdotes illustrating old Scottish life, and numerous sketches of the men who composed the brilliant circle of Edinburgh society at the beginning of the present century. A portion of the MS. kept back until a date further removed from the times of which it treats, appeared in 1874, entitled *Journal of Henry Cockburn*.

CO'CKCHAFER (*Melolontha vulgaris*), a beetle of the family *Lamellicornes* (q. v.), and section *Phyllophagi* (leaf-eaters), very common in England and most parts of Europe, comparatively rare

Cockchafer (*Melolontha vulgaris*):
a, full-grown larva; *b*, pupa; *c*, perfect insect.

in Scotland, famous for the ravages which it commits, both in the grub state and in that of a perfect insect—the winged beetle feeding on the leaves of fruit-trees, and of many forest-trees, as the sycamore, lime, beech, and willow; the grub devouring the roots of plants, particularly of pasture-grasses and corn.

The C. is fully an inch in length, of a pitchy black color, with

a whitish down, giving a sort of powdered appearance; the sides of the abdomen marked by a range of triangular spots; the abdomen terminating in a point; the antennæ short, terminating in a club formed of six or seven leaflets: the grub is about an inch and a half long, thick, whitish, with a red head and six legs. The C. does not live long after it has passed into its perfect state, but it lives nearly four years in the grub or larva state. The female C. deposits her eggs in the earth. The ravages of cockchafers were so great in some of the provinces of France in 1785, that the government offered a premium for the best mode of destroying them. The whole grass of a field has often been destroyed in a short time by their grubs, and the beetles themselves strip off the foliage of trees like locusts. They have sometimes appeared in prodigious numbers in some places in England: the river Severn is said to have been so filled with their bodies in 1574, that the water-wheels of the mills were clogged; and in 1688, they so abounded in the county of Galway, in Ireland; that they hung in clusters on the trees and hedges like bees swarming; the noise of their countless jaws at work was heard by every traveler, and was compared to that of the sawing of timber. Rooks and other birds render great service by preventing the excessive multiplication of cockchafers. In Scotland they are called *clocks*.

Cocker.

CO'CKER, a small kind of spaniel, very similar to the Blenheim dog, often black. The habits and disposition are similar to those of the spaniel. The small size of the C. fits it for ranging in low and thick coverts, and it is accordingly much employed by sportsmen in pheasant and woodcock shooting; but it must not be allowed to range to any considerable distance, as it cannot be trained to wait for the sportsman, but starts the game.

CO'CKER, EDWARD, widely celebrated on account of his *Arithmetic*, which has served as the model of almost all school-treatises subsequent to its publication, was born, it is supposed, in London about the year 1631 or 1632; and died between the years 1671 and 1675. The first edition of his famous *Arithmetic* (which was the first to confine itself to commercial questions only) was published, after his death, 1677, by John Hawkins, who came into possession of C.'s MSS. C. was author of some other works, but his fame rests entirely on the one mentioned. The expression, 'according to Cocker,' became common through its frequent use on the title-pages of arithmetical treatises following his method.

CO'CKERMOUTH, a parliamentary borough in the west of Cumberland, at the confluence of the Cocker and Derwent, 25 miles south-west of Carlisle. It is delightfully situated in an agricultural district, and has a promenade a mile long along the Derwent. The ruins of a castle, founded in the end of the 11th c., stand on a bold height on the left bank of the Cocker, near its junction with the Derwent. The castle was besieged for a month by the royalists in 1648, and afterwards reduced to ruins by the parliamentarians. Near C. is a tumulus, with a Roman camp and ditch 750 feet in circuit. Many ancient relics have been found near Cockermouth. There are manufactures of linens, woollens, cottons, hats, hoisery, and paper, and in the vicinity, extensive coal-mines. Wordsworth the poet was born here. Pop. (1881) 7189. C. returns one member to parliament.

CO'CK-FIGHTING is said to have originated with the Athenians. In the earlier part of our history, since the Conquest, we find little mention of it; but it is evident that it existed in the days of Thomas-à-Becket, and until the time of the Commonwealth it flourished, the pit at Whitehall having been erected and patronized by royalty. It was prohibited in 1654; and although there have been other acts passed with the view of putting it down, it still exists under prohibition.

The greatest point considered in choosing cocks, is the breed. Formerly, there were established favorites, and very large sums were given for their chicks. Much art is said to be displayed in the training of cocks, and in trimming and preparing the cock for the combat; the fastening on of the spurs is a matter of considerable experience. Young cocks are called stags; two years is the best age.

In fighting a match, a certain number of cocks to be shown on either side is agreed upon, and the day before the match, the cocks are shown, weighed to the greatest nicety, and matched according to their weights. Their marks are all also carefully set down, to prevent trickery. The cocks within an ounce of each other in weight are said to '*fall in*,' and are matched. Those which do not fall in, are matched to fight what are called '*byes*.' Those which do fall in, come into the *main*. The main is fought for a stake upon each battle, and so much for the main, or the winner of the most battles in the main; while the byes have nothing to do with the main, and are usually fought for smaller sums. Should the numbers be equal, so that the main cannot be decided, it is usual to separate two or more cocks which are matched to fight, and are of equal or a dead weight, and to give or take an ounce either way with one of each of the birds which would fall into the byes, so as to make an uneven number.

A middling size is considered the best, and from 3 lbs. 6 oz. to 4 lbs. 8 oz. is the medium. Cocks sometimes fight in silver spurs, but more often in steel. The laws of fighting are very precise and particular.

To lend to brutes the means of destroying each other, and of rendering their conflicts more deadly than nature ever intended them to be, cannot be considered a spectacle calculated either to refine or improve humanity; while the indulging in it as a sport, as it is practised even in its lightest and least objectionable form, is simply cruelty. But the practices of placing a bird, that has perhaps been crippled in combat, down, without even his natural weapons, before a young stag armed, in order that the stag may be taught the art of killing, and the Welsh main, where the cocks fight until only one is left alive, are too disgustingly cruel to be thought of without indignation.

C. is prohibited by 12 and 13 Vict. c. 92. A penalty of £5 may be levied on any person keeping fighting-cocks, letting a cock-pit, or otherwise connecting himself with C., for every day that he shall so act.

COCK LANE GHOST. In the year 1762, London was thrown into a state of extraordinary excitement by the reported existence of a ghost in the house of a Mr. Parsons, in Cock Lane, Smithfield. Strange and unaccountable noises were heard in the house, and a luminous lady, bearing a strong resemblance to one who, under the name of Mrs. Kemt, had once resided in the house, but who had died two years before, was said to have been seen. Dark suspicions as to Mr. Kemt having poisoned the lady were immediately aroused, and were confirmed by the ghost, who, on being interrogated, answered, after the fashion of the spirits of our own day, by knocking.

Crowds, including Dr. Johnson, were attracted to the house to hear the ghost, and the great majority became believers. At length a plan was formed by a few sceptics to ascertain the real origin of the noises. The girl, from whom the sounds were supposed to proceed, was taken to another house by herself, and threatened with the imprisonment of her father in Newgate if she did not renew the rappings that evening, the noises having for some time been discontinued. She was observed to take a board with her into bed, and when the noises took place, no doubt was entertained that they had all along been produced by similar methods. A prosecution was then raised by Mr Kemt, and Parsons was condemned to stand thrice on the pillory for imposture and defamation.

COCK OF THE PLAINS (*Tetrao* or *Centrocercus urophasianus*), the largest of the North American species of grouse. It is about one-third smaller than the European Capercailzie (q. v.), or Cock of the Woods. Its plumage is dense and soft, the prevalent color yellowish-brown, but beautifully mottled and varied with darker

Cock of the Plains.

tints; the under parts white, with dark streaks and patches. On each side of the neck is a large bare space, capable, when the bird struts, of being inflated into a hemispherical sac. The female is smaller, and of less showy plumage than the male, and is destitute of the neck-sacs. This bird is an inhabitant of the desolate plains on the upper parts of the Columbia, and in the interior of California, living in flocks, and often feeding so much on species of *Artemisia* that its flesh is almost too bitter to be eaten.

COCK OF THE WOODS. See CAPERCAILZIE.

CO'CKLE (*Agrostemma*), a genus of plants of the natural order *Caryophylleæ*, in which the flower has ten stamens and five styles; the five teeth of the leathery naked calyx are much longer than the tube of the corolla, and the capsule is perfectly 1-celled. The common C., or Corn C. (*A. Githago*), is a frequent weed amongst crops of grain, a native of Europe or the west of Asia, but now to be found in almost all parts of the world. It is an annual plant, clothed with very long hair; with large, solitary, terminal lilac flowers. The root, stem, leaves, and seed were formerly used in medicine; the seed is still sometimes sold in Germany under the name of Black Cumin (Schwartzkümmel). The corn C. is a very troublesome weed in some parts of Britain, and is rare and almost unknown in others.

Corn Cockle.

COCKLE (*Cardium*, a genus of Lamellibranchiate mollusks, having a shell of two equal ventricose valves, more or less of a heart-shaped appearance. The animal has two *adductor* muscles for drawing the valves closely together; its foot is remarkably large, and bent in the middle, and is capable of being suddenly straightened, so that the animal may move by a jump. More commonly, however, the foot is employed for excavating a hole in the sand or mud, in which the C. burrows; and when used for this purpose, it is distended by being filled with water. Cockles are usually gregarious, and vast numbers are found on sandy and muddy banks. The common C. (*C. edule*) is very abundant on the sandy parts of the British shores, and is one of our most valuable shell-fish, affording much palatable and nutritious human food. The number of known species is about 200; they are most numerous within the tropics, and particularly in the Indian Ocean.—The genus *Cardium* is made the type of a family *Cardiadæ*, and of an order *Cardiaceæ*, which includes *Veneridæ*, *Mactridæ*, *Tellinidæ*, and other families.

Cockle with Valves open, showing the Foot.

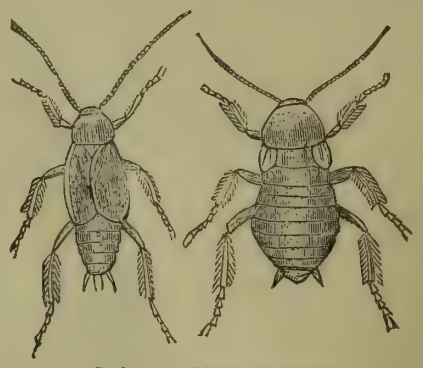
CO'CKNEY. This word is connected with *cocker* (Dutch, *kokeln*, to pamper; Fr. *coqueliner*, to dandle), which, according to Wedgwood, means primarily to rock the cradle, and hence to cherish, pamper.

C. thus meant originally a child delicately nurtured, and was hence applied to the citizens of luxurious towns, as opposed to the hardier inhabitants of the country. The French *Pays de Cocagne*, and similar expressions among other nations, denote a Utopia—an imaginary land of luxurious abundance without labor. London has been famed for its luxury from the earliest times—a veritable Cocagne; and its inhabitants have now appropriated the name of Cockneys.

CO'CKPIT, in a ship of war, is a room near the after-hatchway, under the lower gun-deck; it adjoins the surgeon's cabin and the surgery. It contains the medicine-chests for the entire crew, and is the place where wounded men are attended to during an action.

CO'CKROACH (*Blatta*), a genus of Orthopterous (q. v.) insects, having an oval or orbicular flattened body, the head hidden beneath the large plate of the prothorax, long thread-like antennæ, and wings folded only longitudinally. The elytra are parchment-like, and the wings are sometimes very imperfectly developed, particularly in the females, as in the case of the common cockroach. The eggs of these insects are collected in a sort of shell fixed to the abdomen of the mother, which at last she deposits in a suitable situation, attaching it by a glutinous secretion. The larvæ, when hatched, discharge a fluid which softens the cement that holds together the toothed edges of a longitudinal slit in this remarkable shell, and emerging through it, at once enter upon active life. They are very similar in form to the perfect insects, and, like them, very voracious. Cockroaches are most numerous in warm countries, and even the common C. (*B. Orientalis*)—now so well known in Britain, a pest in many houses, particularly in towns, and, although not a coleopterous insect, often called the Black Beetle—is said to have been imported from abroad, but its native country is uncertain.

It is a nocturnal insect, concealing itself in holes during the day, and fleeing on the approach of a candle. It devours both animal and vegetable substances; and a dark-colored fluid, which it emits from its mouth, gives a disgusting smell to everything that it passes over. A tame hedgehog is of great use for reducing the numbers of cockroaches in kitchens and other places where they abound. Another excellent method of getting rid of cockroaches, is to place a washing-basin on the floor, with some treacle



Cockroach—Male and Female.

in the bottom. A piece of wood resting between the floor and the edge of the basin, conducts the C. to the fatal trap, from which the slipperiness of the sides of the basin prevents their exit. In this way thousands of 'black beetles' may be caught in a single night. The common C. is only about an inch long, but some of the tropical ones are much larger, and are more troublesome because of their frequent use of their wings. The Kakerlac, or American C. (*B. Americana*), a native of the warm parts of America, has found its way into Europe, and infests some seaport towns. A small species (*B Lapponica*) is very common in Lapland, sometimes doing great injury by devouring the winter stores of salted fish.

CO'CKSCOMB (*Celosia cristata*), an annual plant of the natural order *Amarantaceæ*, a native of the East Indies, one of the most familiar inmates of our hothouses and conservatories, often also planted out in warm borders, especially in the southern parts of Britain. It grows with an upright stem, which becomes flattened upwards, divides, expands, and forms a sort of wavy crest, covered with pointed bracts, and bearing on its surface many very small flowers, so crowded as often to present a rich velvety appearance. The colors are various, and often very brilliant.

COCK'S-FOOT GRASS (*Dactylis*), a genus of Grasses, having the panicle of flowers much on one side of the stem, its secondary branches so short that the spikelets are much crowded into clusters; the glumes unequal, the larger one keeled; each spikelet containing 2—7 florets, each of which has two lanceolate scarcely awned paleæ. This genus is closely allied to Fescue (*Festuca*), but differs in habit. The Common or Rough C. G. (*D. Glomerata*), is a native of Europe, Asia, North America, and the north of Africa. It is very abundant in Britain, growing in tufts by waysides, in meadows, woods, &c., from the level of the sea to high altitudes on the mountains. It forms an important part of almost all the best natural pastures, is much relished by cattle, and grows with great rapidity after it has been cut, yielding a large quantity of herbage, and succeeding well on most kinds of soil, and in situations too shady for many other grasses. It is therefore generally sown along with other grasses. An improved variety, of greater size than the ordinary one, has been introduced into cultivation. In America, this grass is called Orchard Grass, and is extensively cultivated. To this genus belongs also the Tussac Grass (q. v.).

COCK'S-SPUR THORN. See Cratægus.

CO'CKSWAIN, or COXSWAIN (pronounced *Cosn*), on board ship, is the steersman of a boat, and commander of the boat's crew. He is expected to have his men always ready for service at short notice, and is furnished with a whistle to summon them.

CO'COA, CACA'O, or CO'CO. The different kinds of C. either consist of, or are prepared from, the seeds of trees of the genus *Theobroma*.

The genus *Theobroma* (Gr. food of the gods) belongs to the natural order *Byttneriaceæ*, and contains a number of species, trees of moderate size, with large undivided leaves and clustered flowers, all natives of the tropical parts of America. It is distinguished by a 5-leaved calyx; five petals, concave at the base, and extended into a strap at the apex; the stamens united at the base into a cup, which is divided upwards into ten segments, five tips being without anthers, and the other five, alternate with them, bearing two anthers each; a threadlike style, terminating in a 5-partite stigma; the fruit a 5-angled capsule, of a substance

between leathery and woody, not splitting when ripe, 5-celled, and containing many seeds in a pap-like or butter-like pulp. The seeds of several species yield more or less of the C. of commerce. By far the most important species of this genus is *T. Cacao*, to which the name C.-tree is often exclusively appropriated. It is extensively cultivated in tropical America and the West Indies, and its cultivation has been introduced into some parts of Asia and Africa. It generally rises with a bare stem to the height of only 6 or 7 feet, dividing into many branches, and attaining a height of only 16 or 20 feet altogether, although it is sometimes twice that height. The fruit is somewhat like a cucumber in shape, and is 6 or 8 inches long, yellow, and red on the side next the sun; the rind is thick and warty, the pulp sweetish, and not unpleasant; the seeds numerous, compressed, and not unlike almonds, with a thin, pale, reddish-brown, fragile skin or shell, covering a dark-brown, oily, aromatic, bitter kernel, which consists mostly of the wrinkled cotyledons. These seeds are the *C. beans* of commerce; when bruised so as to be reduced to small pieces, after being shelled or decorticated, they become *C. nibs*. The C.-tree produces larger seeds in cultivation than in a wild state. The tree attains its full vigor and productiveness in seven or eight years, and generally yields two principal crops in the year. When gathered, the fruit is subjected to five days' fermentation in earthen vessels or in heaps on the ground, and then opened by the hand, and the seeds dried by the sun or by fire; or it is buried for a while in the earth, till the pulp becomes rotten. The latter method is said to produce the best cocoa (*earthed C.*, or *Cacao terré*).

C. is very nutritious. The principal constituent of C. beans is the soft, solid oil called *C. butter*, which forms more than 50 per cent. of the whole shelled bean, about 22 per cent. being starch, gum, mucilage, &c., and 17 per cent. being gluten and albumen. They contain also a crystallizable principle called *Theobromine*, analogous to Caffeine (q.v.), but more nitrogenous.

For dietetic use, C. is prepared in several ways. It is made into Chocolate (q. v.); it is crushed into *C. Nibs*, the purest state in

Theobroma Cacao.

which C. can be purchased in shops; or the unshelled bean is powdered in a hot mortar, or between hot rollers, which yields a paste capable of being mixed with sugar, honey, starch, &c., sold in shops under the name of Soluble C., Rock C., and Common Cocoa.

C. is eaten in the solid state in the form of cakes and bonbons, or is scraped down, and treated with boiling water or milk. When C. nibs are infused with water like coffee, they yield a highly palatable beverage, which is much lighter than any other infusion of cocoa. The large quantity of oily matter present in the bean tends to make the various infusions thick and heavy, so that they do not agree with some delicate stomachs. The annual consumption of C. is upwards of 100 millions of pounds.

An infusion of the broken and roasted shells of C. beans is sometimes used in the same way as tea or coffee. The pulp of the fruit is eaten in the countries in which the tree grows, and a kind of spirit is obtained from it by fermentation and distillation.

CO'COA-NUT, or CO'CO-NUT, the well-known fruit of a species of palm, *Cocos nucifera*, perhaps originally a native only of the Indian coasts and South Sea Islands, but now diffused over all tropical regions. The C. palm belongs to a genus having pinnate leaves, and male and female flowers on the same tree, the female flowers at the base of each spadix. The genus is further distinguished by a simple 3-celled ovary, which is succeeded by a coarse, fibrous, 1-celled drupe, two of the cells becoming abortive. There are about eighteen known species, all natives of South America, except the most important, the C. palm itself. The American species prefer dry and somewhat elevated districts. The C. palm, on the contrary, is seldom found at any considerable distance from the sea-coast, except where it has been introduced by man, and generally succeeds best in sandy soils near the sea. It is always one of the first of the larger plants to establish itself in the low islands of the Pacific Ocean, so soon as there is soil enough.

It has a cylindrical stem, about 2 feet in diameter, and from 60 to 100 feet high, with many rings marking the places of former

Crown of Cocoa-nut Palm, with Fruit.

leaves, and bearing at its summit a crown of from sixteen to twenty leaves, which generally curve downwards, and are from 12 to 20 feet in length. The flowers proceed from within a large pointed spathe; the fruit grows in short racemes, which bear, in favorable situations, from five to fifteen nuts; and ten or twelve of these racemes, in different stages, may be seen at once on a tree, about eighty or one hundred nuts being its ordinary annual produce. The tree bears fruit in from seven to eight years from the time of planting, and continues productive for seventy or eighty years. Of the three round black scars at one end of the shell, the one which alone can be easily pierced with a pin, and through which an opening is commonly made to get out the *milk*, is the destined outlet of the germinating embryo, which is situated there, the kernel consisting generally of the albumen (q. v.) destined for its nourishment. The thick husk is remarkably adapted to the preservation of the seed, whilst the nut is tossed about by the waves, until it reaches some shore far distant from that on which it grew.

The C. affords to the inhabitants of many tropical coasts and islands great part of their food; it is not only eaten as it comes from the tree, both ripe and unripe, being filled in a young state with a pleasant milky fluid, but is also prepared in a variety of ways, as in curries, &c.

The kernel of C. contains more than 70 per cent. of a fixed oil, called C. Oil, or C. Butter. The oil is itself an important article of commerce, being much employed in Europe, particularly for the manufacture of *Stearine candles;* and also of a *marine soap*, which forms a lather with sea-water. In tropical countries, and particularly in the East, it is much used as a lamp oil, and as an unguent. It is also employed as an article of food, so long as it remains free from rancidity, to which, however, it is very liable. It is obtained by pressure of the bruised kernel, or by boiling over a slow fire, and skimming off the oil as it floats on the surface. A quart, it is said, may be obtained from seven or eight cocoa-nuts. It is liquid in the ordinary temperatures of tropical countries, but in colder climates, becomes a white, solid, butter-like oil. It becomes liquid about 74° Fahr. It can be separated by compression in the cold into a more liquid portion called *olein*, and a more solid part termed *cocostearin*, or *cocosin*, which is of complex constitution, and contains at least six fatty acids. C. oil is not a good lamp oil, as it chars on the wick, and burns with smoky flame. This remark applies also to the *olein* obtained from it, which, however, is used mixed with sperm oil, but it lowers the value of the sperm oil. C. oil and resin melted together yield a substance capable of being used with success in filling up the seams of boats and ships, and in tropical countries, for covering the corks of bottles, as a protection from the depredations of the white ants.

The root of the C. palm possesses narcotic properties, and is sometimes chewed instead of the areca-nut.—When the stem is young, its central part is sweet and eatable; but when old, this is a mass of hard fibre.—The terminal bud (*Palm Cabbage*) is esteemed a delicacy, and trees are often cut down for the sake of it.—The saccharine sap (*toddy*) of the C., as of some other palms, is an esteemed beverage in tropical countries, either in the state in which it is obtained from the tree, or after fermentation, which takes place in a few hours; and from the fermentedsap (*palm wine*), a spirituous liquor (*arrack*) is obtained by distillation. The juice is often also in the East Indies boiled down to yield sugar (*jaggery*).

The dried leaves of the C. palm are much used for thatch, and for many other purposes, as the making of mats, screens, baskets, &c., by plaiting the leaflets. The midribs of the leaves supply the natives of tropical coasts with oars.—The wood of the lower part of the stem is very hard, takes a beautiful polish, is employed for a great variety of purposes, and is imported into Britain for ornamental joinery, under the name of PORCUPINE WOOD.—The fibrous center of old stems is made into cordage.—By far the most important fibrous product of the C.-tree is COIR (q. v.), the fibre of the husk of the imperfectly ripened nut. The husk of the ripe nut is used for fuel, and also, when cut across, for polishing furniture, scrubbing floors, &c.

The shell of the C. is made into cups, goblets, ladles, &c., and is often finely polished and elaborately ornamented by carving.—Within the nut there is occasionally found a small stony substance, of a bluish-white color, 'a sort of vegetable bezoar,' called in India *Calappa*, which is eagerly purchased by the Chinese, who ascribe great virtues to it as a sort of amulet to preserve them from diseases.

Cocos butyracea, one of the South American species of this genus, is a very large tree, and its nut abounds in an oil and butter of similar quality to that obtained from the cocoa-nut.—The DOUBLE C. of the Seychelles Islands is the fruit of a palm of a different genus.

COCOA-NUT BEETLE (*Batocera rubus*), a large beetle of the family *Longicornes* (q. v.), tribe *Lamiariæ*, the larvæ of which are very destructive in cocoa-nut plantations, eating their way in all directions in the stems of the younger trees. They are destitute of feet, large and pulpy, and of repulsive aspect; but are esteemed a luxury by the coolies of the East. They resemble the *grugru worms* of South America.

COCOO'N, a silken envelope which the larvæ of many insects spin for themselves immediately before their transformation into the pupa state, and which serves for the protection of the inactive and helpless pupa. The name is sometimes extended to coverings formed of other materials, by agglutination or otherwise. Many insects mix foreign materials of various kinds with their silken cocoons; some caterpillars, as those popularly called *woolly bears*, working into them the hairs with which their own bodies were previously covered; and others fastening together the sides of a leaf or of several adjacent leaves. Some of the moths, which attach their silk to leaves, so that the leaf itself forms part of the protective covering of the pupa, proceed with a mathematical nicety as to the position and direction of their threads, more wonderful, if possible, than even that exhibited by bees in the building of their comb. The silken substance of which cocoons are made, is produced much more abundantly by some kinds of larvæ than by others; the cocoons of some being only an open network, whilst others form a compact ball. The C. of the common silk-worm exhibits externally a loose gauze-like covering, within which is a close and compact oval ball; yet all is of one continuous thread, which may be unwound from it 1000 feet long. Different parts of this thread are of different qualities, but the stronger part of it may be unwound as easily as a ball of cotton. The insect works from the outside inwards, and the outer parts of the C. are produced first. The spinnerets by which the C. of the silk-worm and those of other moths are produced, are situated at the mouth of the caterpillar; but the larvæ of a few insects—not lepidopterous—have them at the opposite extremity of the body. The time occupied in spinning the C. is very various in different insects; in the silk-worm, it extends to several days.

CO'CUM OIL, a solid oil or vegetable butter, obtained from the seeds of *Garcinia purpurea*, an Indian tree of the same genus with the mangosteen. It is white or pale greenish yellow, brittle or friable, with a faint and not unpleasant odor. It melts at 95° F., but when cooled after being melted, remains liquid to 75° F. It is used for mixing with ghee (butter), and is exported to Britain for mixing with bear's greese in the manufacture of pomatum.

COCY'TUS, the name given by the ancients to a river of Epirus, fed by the snows of Pindus, and which, after a long underground course, was regarded as falling into the Acherusian Lake.—Cocytus was also the name of a river of the infernal regions, a branch of the Styx.

COD (*Gadus Morrhua*, or *Morrhua vulgaris*), a fish of the family *Gadidæ* (q. v.), almost rivaling the herring in its importance to mankind. The genus to which it belongs is distinguished by having three dorsal fins, two anal fins, and a barbule beneath the chin. The C. sometimes attains a weight of 100 lbs.; but even from a small size, it is in request for the market and the table. The roe of the female has been estimated to contain from four to nine millions of eggs, a reproductive power which seems beneficently intended to provide supply for far more extensive fisheries than are yet carried on. The C. is found in all the northern parts of the Atlantic Ocean, and in the arctic seas; it is not known in the Mediterranean. It occurs both on rocky coasts and on sand-banks, where the largest are usually caught in depths from 25 to 50 fathoms.

The productiveness of the great banks of Newfoundland excels that of all others, but the cod-fisheries near the coast of Sweden, Iceland, and the north of Scotland are also important. The Dutch were engaged in the cod-fishery as early as the middle of the 14th c., and the English resorted for this purpose to the coasts of Iceland about the same period. More than 6000 European vessels are said to be employed in it, besides boats along the shores. The fishery is always carried on by means of lines and hooks, partly by *long-lines* and partly by *hand-lines*. One man has been known to catch from 400 to 550 fish, on the banks of Newfoundland, in ten or eleven hours; and eight men to take eighty-score in a day on the Dogger Bank. The C. is very voracious. Small fishes, shell-fish, &c., are used for bait. The C. is used as food, either fresh, salted, or dried. Great quantities of dried C. are carried from Newfoundland to the West Indies, and are consumed also in the Roman Catholic countries of the south of Europe. *Cod Sounds* are esteemed a delicacy, and are often salted, and so sent to market. They are also used in a dried state as isinglass. The recent discovery of the medicinal value of Cod-liver Oil (q. v.) has added to the economical importance of this fish.

ROCK C. and RED C. are names given to the common C. when its color is somewhat affected by living among weedy rocks.—BALTIC C. is a name of the Dorse (q. v.).

CO'DA, in Music, is the ending or winding-up of a composition by an extra-melodic phrase, for more completely establishing the final cadence. It may be compared to the peroration of an oratorical discourse.

CODE (Lat. *codex* and *caudex*), the primary meaning of the Latin word was the trunk or stem of a tree; latterly, it came to signify more especially wooden tablets bound together, and covered with a coating of wax, which were used for writing on. After parchment and paper were substituted for wood, the name C. was still retained. Cicero applies it to a bill; but it was not till still later, in the times of the emperors, that it was used to express a collection of laws and constitutions.

Codes, Roman.—1. *Codex Gregorianus and Hermogenianus.*—The term *codex* never was applied to the laws of the twelve tables, and the earliest collections so called were those of Gregorianus or Gregorius, and Hermogenianus. Of these, whether two separate collections, or two parts of one collection—a disputed point—we have only fragments. They never received the imperial authority, but they were quoted as authoritative compilations in the courts, and they supplied the models on which the subsequent works of Theodosius and Justinian were executed.

2. *Codex Theodosianus.*—This compilation was executed by a commission of eight persons appointed by Theodosius the Younger in the year 429, and afterwards increased to sixteen. The work was completed and published, or rather promulgated, as law throughout the Eastern Empire in 438, and declared to be a substitute for all the constitutions made since the time of Constantine. In the Western Empire also, having been laid before the senate, it was confirmed as law in the same year by Valentinian III., the son-in-law of Theodosius. Nine years later, the new constitutions (*novellæ constitutiones*), which had been made since the promulgation of the C., were likewise promulgated in the Western Empire. The name of novels (*novellæ*) continued to be given to all the constitutions issued subsequent to the date of the Theodosian C. up to the overthrow of the Western Empire. The C. of Theodosius has been, in a great measure, preserved. It consists of sixteen books, which are subdivided into titles and sections. The best edition is that of J. Gothofredus (6 vols. fol., Lugd. 1665), which was re-edited by Ritter (Leip. 1736—1745). This edition contains the Theodosian C. entire, except in the first five, and part of the sixth book, for the reproduction of which the Breviary or abridgment prepared by the orders of Alaric II., king of the Visigoths—which itself may be regarded as another C.—formed the only guide. Some recent discoveries of MS. and palimpsests have added considerably, not only to our critical knowledge of the contents of this C., but have enabled us to restore several of the genuine constitutions of the first five books. Of the 262 laws and fragments of laws, which were omitted in the Breviary, 62 have been thus restored (see *Jus Civile Antejustin*, Berol. 1815).

3. *Codex Justinianeus.*—In 528, the Emperor Justinian appointed a commission of ten persons, one of whom was the celebrated Tribonian (q. v.), to compile a C., incorporating in it the previous codes of Gregorianus, Hermogenianus, and Theodosius, and also the Constitutions (q. v.), Rescripts (q. v.), and Edicts (q. v.), subsequently issued. The work was performed in fourteen months, and it was then declared that the new C. should supersede the older compilations. A second edition of this work, revised, and having subsequent constitutions, &c., incorporated (*Codex Repetitæ Prælectionis*), is what we now know as the C. of Justinian. It consists of twelve books, divided into titles.

Gothic C.—The laws of the barbarians were all collected into

a single C., which bore the title of *Codex Legum Barbarorum*. Of these various systems, the first was that of Alaric, king of the Visigoths, mentioned above, augmented by the legislative labors of his successors. To this C. was given the title of the Gothic law, *par excellence*, and it was the best and fullest of all the barbarian codes. The second C. comprised in the collection was that of the Burgundians; the third, the Salic law (q. v.), composed when the Franks issued from their German forests; the fourth, the law of the Frisians, which dates from the times of their conquerors Pepin and Charles Martel. These, and all the other codes by which the tribes of the north which overthrew the Empire were governed, merged at last in the feudal system, and a mass of local customs speedily arose which introduced the greatest uncertainty into jurisprudence.

French Codes.—Charles VII. was the first of the kings of France who attempted, by a series of general *ordonnances*, to introduce something like uniformity into the legislation of France; and several of his successors, in particular, Louis XI. and Henry III., entertained the idea of establishing a single C. for the whole kingdom. A C., having this object in view, was subsequently prepared by Michel de Marillac, and published in 1629. It consisted of 471 articles, and is spoken of by French jurisconsults in terms of the highest praise. Its reception, however, was very partial, confined indeed to the jurisdiction of the parliament of Dijon. Louis XIV., who, amongst his other ambitions, affected that of becoming the French Justinian, published a series of very important ordonnances embracing most of the leading departments of the law. The work was executed by a commission composed of the most distinguished magistrates and advocates of the kingdom, and before the various ordonnances received the royal assent, the king caused them to be discussed with the principal officers of parliament. Minutes of these discussions have been preserved, and they constitute one of the most precious monuments of the history of French jurisprudence. Many important chapters were subsequently added to this C., before it assumed the form in which, as the C. of Louis XV., it represents the condition of French jurisprudence previous to the Revolution.

Such, with the addition of sundry attempts at legislation during the period of anarchy which succeeded, was the position of affairs when Napoleon assembled that brilliant band of jurisconsults—Tronchet, Portalis, Merlin, Bigot-Préameneu, Treilhard, Pensey, &c.—by whose labors, aided in no insignificant degree by that marvelous insight into human affairs which he himself possessed, the modern legislation of France, and of no small portion of the rest of Europe, was called into existence. Such was the energy which he contrived to bring to bear on the work, that the vast edifice of the C. Napoleon, or C. Civil, was reared in a single year, the first title having been promulgated on the 5th March 1803, and the last on 30th March 1804. The C. de Procédure Civile followed in 1806, the C. de Commerce in 1807, the C. d'Instruction Criminelle in 1808, and two years afterwards, the C. Pénal. The period of the Restoration produced several codes of less importance—forest-laws, fishing-laws, &c. The C. Napoleon received the force of law in the countries which were successfully subjugated by France; in Italy, in the kingdom of Holland, in the Hanseatic departments, in the grand duchy of Berg. In the Rhenish provinces and in Belgium, it still forms the basis of legislation.

Since 1867, but especially since 1871, great progress has been made in the codification of German law.

CODEX (pl. CODICES: for derivation see preceding article), the name applied to ancient manuscript copies of the Scriptures. See BIBLE.

CO'DICIL, a supplement to a will, whereby anything omitted is added, or any change demanded by the altered circumstances of the testator or the beneficiaries, is effected. A C. is authenticated in the same manner as a will, and possesses the same privileges when holograph, or written by the hand of the testator himself. See TESTAMENT, WILL.

CODIFICA'TION, the act of forming a Code (q. v.), or systematic collection of laws. Though a code, in the wider sense, comprehends frequently the whole legislation of a country, there is a narrow sense in which the term is applied to a particular branch of legislation, such as commercial law, criminal law, marine, &c. In this latter sense, some of our general acts of consolidation, such as the Merchant Shipping Act of 1854 (17 and 18 Vict. c. 104), may almost lay claim to the character of codes. All attempts at C. in the wider sense in England have failed, notwithstanding the earnest advocacy of Lord Brougham. The department in which it seems to be most hopeful is the law-merchant in which, being necessarily cosmopolitan beyond the other departments of the law, great benefit may be derived from the labors of our continental neighbors. See CODE.

CO'DLIN, the name given to a number of varieties of apple, chiefly used for culinary purposes. Some of them are in high repute in Britain, both on account of the quality of the fruit and the productiveness of the tree. The fruit cannot easily, however, be kept long. In most of the varieties which bear this name, it is large and somewhat conical. The trees are often propagated by layers or suckers, or even by slips, plants thus obtained becoming fruitful much sooner than grafted trees.

CODLIN MOTH (*Pyralis pomona*), a small moth which is very injurious in apple-orchards in some parts of Britain, laying its eggs in the eyes of the newly formed fruit, within which the larva feeds, so that the growth of the fruit is arrested, and it falls prematurely off. This moth is one of the *Tortricidæ*, agreeably colored, with rather short and broad wings. The caterpillar has sixteen feet.

COD-LIVER OIL is generally obtained from the livers of the common cod (q. v.), but likewise from allied species, as ling, dorse, coal-fish, torsk, &c. In these fish, the adipose tissue (q.v.), containing oil, is almost entirely confined to the liver, in which they agree with the shark tribe, whilst in other fish, as in the herring and salmon, the oil is diffused over the entire structure of the animal. C. O. is prepared largely in Britain, Norway, and Newfoundland. There are three varieties of the oil sold in commerce—*pale C. O.*, *pale-brown C. O.*, and *dark-brown Cod-liver Oil*.

In the preparation of the oil, the livers are placed in a tub with a layer of spruce boughs at the bottom, and subjected to pressure, when the light-colored or pale oil exudes, and is run off by an opening at the lower part of the tub. As the livers partially putrefy, more oil escapes, which is darker than that procured from the fresh livers, and constitutes the pale-brown oil; whilst the residual livers being boiled with water, part with the remaining oil they contain, and yield the dark-brown oil. The pale oil thus approaches more nearly the condition in which the oil is present in the livers, while the other varieties are more or less impregnated with the products of the putrefaction of the livers. The purer oil has a peculiar fishy odor and taste, which is not disagreeable, although it remains for a little time, and in some cases requires a little practice to get accustomed to it. The darker varieties have more or less of a disagreeable empyreumatic odor and taste, and leave in the throat an unpleasant nauseous sensation, more difficult to overcome.

The oil mainly consists of oleic and margaric acids, in combination with glycerine, and holding in solution the constituents of the bile, acetic acid, a phosphorized oil, as also iodine and bromine. These ingredients are most largely present in the light-colored oil. C. O. is occasionally adulterated with more or less train-oil, to which a little iodine has been added. In the purer varieties of C. O., the presence of any such admixture can be at once observed from the disgusting odor, although in the darker varieties of C. O. the test of odor cannot be relied on.

As a remedy, C. O. has a great reputation as efficacious in the treatment of scrofulous and tubercular diseases, and especially in Consumption (q. v.); it has also been used extensively in chronic rheumatism, in rickety affections, and in other diseases of the bones and joints. The virtues of C. O. have been ascribed to iodine, bromine, and other specific ingredients; but, on the whole, the most probable view of its action is that it is simply a fattening agent—a fatty food—and that it acts by nourishing the system in cases attended with emaciation, just as new milk, cream, and butter, or fat bacon, will sometimes act in similar cases. C. O. is often found to be more easily digested than, from its somewhat disagreeable odor and taste, might have been expected. Children, in particular, often take it readily; and in emaciated old people, it is sometimes of great service in conjunction with remedies suited to the peculiar character of the case. In true tubercular consumption, it has for some years enjoyed a great reputation; but it is very far from having anything like a specific remedial action in that disease. C. O. is commonly taken in doses of from a dessert-spoonful to a table-spoonful three times a day; but a pint, or even more, is said to have been consumed daily in some instances with good effect, or at least without injury.

CODO'GNO, a town of Lombardy, Northern Italy, situated in a rich district between the Adda and the Po, about 15 miles to the south-east of Lodi. It is well built, and has manufactures of silk and linen, and a great trade in cheese. Pop. 9632.

CO'DRINGTON, SIR EDWARD, G.C.B., &c., a distinguished British admiral, third son of Edward Codrington, Esq., was born in 1770, and entered the navy in 1783. In 1794 he was lieutenant of the *Queen Charlotte*, Lord Howe's flag-ship, in the actions of the 28th and 29th May and 1st June. At the battle of Trafalgar in 1805, he was captain of the *Orion*, 74. He afterwards served in the Mediterranean, and in North America, and rose to the rank of vice-admiral in 1821. In November 1, 1826, he was appointed commander-in-chief of the Mediterranean squadron, and in that capacity took the leading part in the battle of Navarino (q. v.). In reward for this victory, he received the Grand Cross of the Bath, with Russian and French orders; but the battle being considered an 'untoward event,' C. was recalled. He attained the full rank of admiral of the red in 1837, and in 1839 was appointed commander-in-chief at Portsmouth. He was M.P. for Davenport from

1832 to 1839. He died April 28, 1851.—His son, GENERAL SIR WILLIAM JOHN CODRINGTON, G.C.B., was commander-in-chief in the Crimea, 1855—1856; and was promoted to the rank of general in 1863. The brother of the last mentioned, ADMIRAL SIR HENRY JOHN CODRINGTON, K.C.B., took part in the destruction of St. Jean d'Acre, and became an admiral in 1867.

CO'DRUS, the last king of Athens, was the son of Melanthus, and, according to Grecian legend, sacrificed his life for his country about the year 1068 B.C. A war raging between the Athenians and Dorians, the oracle declared that the victory should belong to those whose king was slain by the enemy; whereupon, C., attiring himself as a peasant, entered the Dorian camp, and having picked a quarrel with some of the soldiers, contrived to have himself slain. His son, Medon, was made Archon (q. v.) for life, on the pretence that no one was worthy to succeed such a man as king. The accounts, however, which have come down to us, indicate that the sons of C. had quarrelled about the succession after their father's death, and it is more probable that the aristocratic families (the Eupatrids) took advantage of the opportunity presented to them, of diminishing the regal authority by abolishing the name.

COEFFI'CIENT (Lat. together-making) is the name given in Algebra to the known or constant factor of an unknown or variable quantity. Thus, in the expressions $4x$ (4 times x), bz (b times z), 4 and b are coefficients of x and z, b being supposed known as well as 4, and x and z unknown or variable. Strictly speaking, in a product, such as 3×5, $4 \times x$, or $b \times z$ ($= bz$), either of the two factors is a C., since they 'together make' the product; but in practice, the meaning is restricted as above explained.

COEHOORN, or COHORN, MENNO, BARON VAN, called the Dutch Vauban, was born at Lettingastate, near Leeuwarden, in 1641, and studied fortification and mathematics under his uncle Bernardus Fullenius, then professor of these sciences at Franeker. Prince Henry Casimir, Stadtholder of Friesland, apprised of the youth's great abilities, appointed him, in his 16th year, captain of a company of infantry; and in 1674 C. greatly distinguished himself at the siege of Maestricht, and in various battles. At the siege of Grave, in 1674, he demonstrated that small portable mortars might be advantageously employed (see next art.); and also that the combined effect of a certain mass of projectiles is much greater than the effect produced by a successive discharge of the separate projectiles composing the mass. The application of this principle distinguishes the operations of Coehoorn. C. covered himself with honor before Kaiserswerth (June) and Bonn (October 1689), and the Elector of Brandenburg wanted to make him major-general, a promotion he refused. He also distinguished himself in the battle of Fleurus (July 1, 1690). He was now for some time in disgrace, but was soon sought again by William III. He fortified Namur, and defended his own intrenchment 'William' against Vauban in 1692; besieged that fortress in 1695, and retook it; was appointed lieutenant-general and director-in-chief of the Dutch fortifications, and fortified several towns, of which Bergen-op-Zoom may be considered his master-piece. In 1702 he annihilated the French lines near St. Donat. He died at the Hague, March 17, 1704. His principal works are, *The New System of Fortification* (Leeuwarden, 1685) and *The Pentagon.*

COE'HORNS—named from the military engineer who invented or introduced them—are small howitzers or mortars, generally $4\frac{2}{5}$ inches calibre. These implements of war, being easily moved and adjusted, and taking little powder, are found very useful in sieges, if grouped in great number. A battery of 30 or 40 C., by pouring their small shells or grenades into the outworks of a fortress, may prevent the garrison from effecting a strong occupation, or making a demonstration.

CŒ'LELMI'NTHA (Gr. hollow worms), the name given by Owen to one of the two orders of Entozoa (q. v.), or Intestinal Worms, having a distinct abdominal cavity and intestinal canal, the *Vers intestinaux cavitaires* of Cuvier. Examples of this order are *Ascaris*, *Strongylus*, and *Filaria.*

CŒLENTERATA. See SUB-KINGDOMS, ANIMAL.

CŒ'LE-SY'RIA (Hollow Syria), now called by the natives El-Bŭkâ'a, 'the deep plain,' a valley of Syria, extending between the ranges of the Lebanon and Anti-Lebanon. Near Bar Elias, it is 2854 feet above the sea. Its length is about 100 miles, and its average breadth 10. In this valley stand the ruins of Baalbek and the village of Zahleh.

CŒ'LIAC A'XIS. See AORTA.

CŒ'NOBITES (Gr. *koinos*, common, and *bios*, life), or SYNODITES, the name given to those monks who live together, in contradistinction to the Anchorites (q. v.), or hermits, who withdraw from all society, and live in a solitary fashion. The first *Cœnobium*, or monastery, was founded by Pachomius, a disciple of St. Antony, about the year 340 A.D., at Tabennæ, an island in the Nile. In a short time, it reckoned 1300 monks, and stimulated the establishment of numerous other monasteries in Egypt, Syria, and Palestine.

CŒNU'RUS. See CESTOID WORMS.

CO'FFEE. This well-known beverage is an infusion of the roasted albumen of the seeds of the C. tree (*Coffœa Arabica*), a native of Abyssinia and Arabia, but now naturalized in many of the tropical countries colonized by Europeans. There are a number of species of *Coffœa*, but this one only is known to possess valuable properties; the seeds of *C. Mauritiana* prepared in the same way, are bitter and slightly emetic. The genus belong to the natural order *Cinchonaceæ*. It has a tubular 4—5-cleft corolla, and a succulent fruit containing two cells lined with a cartilaginous membrane, and each containing one seed.

In a wild state, the C. tree is a slender tree of 15—25 feet high, with few branches; in cultivation, it is seldom allowed to become more than 6—10 feet high, and is made to assume a sort of pyramidal form, with horizontal branches almost from the ground. The leaves are evergreen, opposite, very shining, oblong, and leathery; the flowers are small, clustered in the axils of the leaves, and snow-white; the whole appearance of the tree is very pleasing; and the smell of the flowers is delicious. The fruit, when ripe, is of a dark-scarlet color, and the seeds are semi-elliptic, and of a horny hardness. The seeds are commonly termed *C. Beans*, but this name is not derived from a resemblance to beans, which they have not, but from the Arabic word *bunn*. They are sometimes, but very incorrectly, designated *C. berries.*

The C. tree succeeeds only in countries where the average temperature of the year is about 64—70° F. In Peru and Quito, it is acclimatized at an elevation of 6000 feet, where, however, frost never occurs; but as it delights in a moist atmosphere, it nowhere thrives better than in tropical islands. The fruit ripens in the hothouses of Britain, where the C. tree frequently flowers. C. plantations are laid out pretty much in the same way everywhere. In quadrangles, bordered by fruit-trees, the C. trees stand in rows; they are pruned to the same height, and the ground between them is carefully kept clear of weeds. Where the climate is dry, abundant irrigation is necessary, but the supply of water is cut off as the fruit begins to ripen, in order to the improvement of its quality. The tree yields its first crop in the third year; the crop from a full-grown tree may amount to a pound of C. beans. As the C. tree continues flowering for eight months, its fruits are at any time of very unequal ripeness; in the West Indies and Brazil, three gatherings are therefore made annually. The beans are placed on mats or large floors specially adapted for the purpose, where they are dried by the sun's rays, being meanwhile frequently turned. They are passed between rollers to remove the dried pulp of the bean, and the membrane which encloses the seeds themselves, and the C. is afterwards freed from impurities by winnowing, and conveyed in bags to the seaports. As equal care is not, however, bestowed upon the preparation of it in all places where it is cultivated, there are great differences in quality and price.—The earlier history of the C. tree is not very clear. It was not known to the Greeks or Romans; but in Abyssinia and Ethiopia it has been used from time immemorial; and in Arabia it was certainly in use in the 15th c., and over the rest of the East in the 16th century. Towards the end of the 17th c., it was carried from Mocha to Batavia by Wieser, a burgomaster of Amsterdam, where it was soon extensively planted, and at last young plants were sent to the botanical garden at Amsterdam, from which the Paris garden obtained a tree. A layer of this was carried out to Martinique in 1720, where it succeeded so well, that in a few years all the West Indies could be supplied with young trees.

Coffee:
a, a branchlet with leaves, flowers, and fruit; *b*, section of fruit.

The following sorts are particularly distinguished from each other in commerce. *Mocha C.*, which comes from Arabia, and is known by its small gray beans inclining to greenish; *Java* or *East Indian C.*, which has large yellow beans; *Jamaica C.*, with beans somewhat smaller and greenish; *Surinam C.*, which has the

largest beans; *Bourbon C.*, with beans pale yellow and almost whitish.

The employment of C. as a beverage was introduced from Arabia, in the 16th c., into Egypt and Constantinople. Leonhard Rauwolf, a German physician, was probably the first to make C. known in Europe, by the account of his travels printed in 1573. Soon after the first introduction of C., COFFEE-HOUSES arose almost everywhere. The first in Europe was established in Constantinople in 1551. In London, the first coffee-house was opened in Newman's Court, Cornhill, in 1652, by a Greek named Pasquet. This Greek was the servant of an English merchant named Edwards, who brought some C. with him from Smyrna, and whose house, when the fact became known, was so thronged with friends and visitors to taste the new beverage, that to relieve himself from annoyance, Edwards established his servant in a coffee-house. The first coffee-house in France was opened at Marseille in 1671, and in 1672 there was one opened in Paris, which soon had several competitors.

In Arabia and the East, C. is not usually prepared as a beverage in the same way as in Europe, except by Europeans. A decoction of the unroasted seeds is there generally drunk; and for the 'Sultan's Coffee,' the pericarp with the dried pulp roasted, is employed.

The great demand for C. has led to the employment of a number of cheaper substitutes, of which *Chicory* (q. v.) root is the best known in this country. Of others, dandelion root, carrot, and the seeds of the common yellow iris may be mentioned. They are prepared by roasting like coffee. The seeds of *Astragalus Bœticus*, already mentioned in the article ASTRAGALUS, are known on the continent of Europe as *Swedish C.*, and are said to be the best substitute for C. yet discovered. But all these substitutes want the most important constituent of true C., *caffeine;* and are therefore very different from it in their qualities. C. is subject to great adulteration, most of the articles specified as substitutes being employed for this purpose. The chief substance of mixture, however, is chicory, the use of which for this purpose was legalized by a Treasury minute in 1840. This adulteration was prohibited by a Treasury minute of 1852; but it being found impossible to make the prohibition effectual, a minute was passed in the succeeding year, permitting the mixture and sale of C. and chicory, on condition that the parcels containing it were labelled in conspicuous letters *Mixture of Coffee and Chicory.*

The leaves of the C. tree are used in the western part of Sumatra instead of the seeds. They are prepared by quick drying in a manner similar to that in which tea-leaves are prepared; and in this state contain even a larger proportion of caffeine than the C. beans of our shops. It seems not improbable that the use of the C. leaf may yet extend very much.

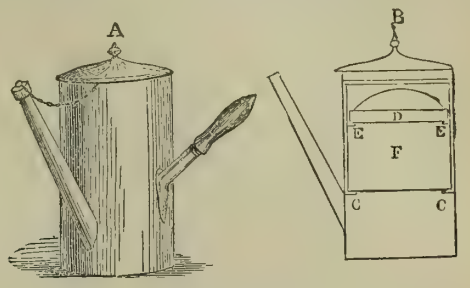
C. owes its exhilarating and refreshing properties to the presence of three substances: 1. *Caffeine* (q. v.)., which occurs in the roasted bean to the extent of ½ to 1 per cent.; 2. A *Volatile oil*, which is not present in the raw bean, but is developed during the process of roasting to the extent of only one part in about 50,000 of the roasted C.; and 3. Astringent acids, resembling tannic acid, but called Caffeo-tannic and Caffeic acids. The average composition of unroasted C. is as follows:

Caffeine	0·8
Legumin (vegetable caseine), (q. v.)	13·0
Gum and sugar	15·5
Caffeo-tannic and Caffeic acids	5·0
Fat and volatile oil	13·0
Woody fibre	34·0
Ash	6·7
Water	12·0
	100·0

When the beans are roasted till they assume a reddish-brown color, they lose 15 per cent. by weight, and gain 30 per cent. in bulk; when further roasted till they become chestnut-brown, they have lost 20 per cent. by weight, and increased 50 per cent. in bulk; whilst if the roasting is continued till the beans become dark-brown, they lose 25 per cent. in weight, and acquire 50 per cent. in bulk. The beans should never be darker than a light-brown color, which is quite sufficient to bring out the excellent aroma and other qualities of the C.; and when the roasting is carried further, more or less charring is the result, and a disagreeable burned smell is produced, which tends to overcome the natural pleasant aroma.

C. does not retard the action of the bowels, as strong infusions of tea tend to do, partly because there is less of the astringent principle, and also owing to the presence of the aromatic oil which tends to move the bowels. The important offices which C. fulfils are, to allay the sensation of hunger; to produce an exhilarating and refreshing effect; and, most important of all, to diminish the amount of wear and tear, or waste of the animal frame, which proceeds more or less at every moment. See NUTRITION. The grounds of C. are very nutritious, from containing so much legumin; and some of the eastern nations take advantage of this, and use the grounds as well as the infusion. In other respects, C. possesses similar properties to Tea (q. v.).

An endless variety of apparatus have been contrived—some of them of great complexity—for preparing C. for the table. The chief object aimed at is, to obtain the liquor free from all sediment. One of the simplest and cheapest of these contrivances is the percolating C. pot, represented in the figure. The easiest way of making C.—requiring no special apparatus, and as satisfactory in the result perhaps as any—is to put two ounces of (fresh-roasted and fresh-ground) C. into a small saucepan or common C.-pot; pour over it a pint of boiling water, and allow it to stand, closely covered up, by the side of the fire (but *not* to boil) for five minutes. The liquor may then be simply poured off the grounds, or it may be strained through a cloth, and then returned to the saucepan or C.-pot (previously rinsed out), and warmed again. Soyer recommends, that before the boiling water is poured in, the saucepan should be set dry on the fire, and the powder stirred till it is quite hot, but not in the least burned. In France,



Percolating Coffee-pot:

A is the coffee-pot with the nozzle fixed; B is a section of the same with the perculator, F, inserted, which easily slips into the coffee-pot, and rests on plugs at C, C; D is a small upper percolator, with a curved handle, which fits into the top of F, also resting on plugs, E E. When coffee is made in this pot, all the openings in the percolator are covered gently with coffee; the small upper percolator, D, is put in its place, and boiling water is poured through it on the coffee, in such quantity as may be wished. The cover and nozzle are immediately fitted on the pot, which is placed on the fire until steam appears at the spout and cover, when it is instantly withdrawn.

a pint of boiling milk is added to a pint of coffee. The chief effect of adding chicory to C. is to deepen the color.

ESSENCE OF COFFEE is a highly concentrated infusion, mixed to the consistence of treacle with extract of chicory and burned sugar, and kept in well-corked bottles. By pouring boiling water upon a tea-spoonful of the essence, a cup of very tolerable C. may be prepared in a moment.

The trade in C. is of great importance. The following statement is given in *M'Culloch's Commercial Dictionary* as 'a pretty fair estimate' of the comparative exports of C. from the principal places where it is produced, and of the annual consumption in those countries into which it is imported from abroad:

EXPORTS.

	Tons.	
Mocha, Hodeida, and other Arabian ports	8,000	
Java	55,000	
Sumatra and other parts of foreign India	8,000	
Brazil and the Spanish main	160,000	
Hayti	16,000	
Cuba and Porto Rico	7,000	
British West India colonies	2,000	
India and Ceylon	38,000	
Dutch West Indies	2,000	
French West Indies and the Isle de Bourbon	2,500	
		298,500

CONSUMPTION.

	Tons.	
Great Britain	16,000	
Netherlands and Holland	40,000	
Germany, Russia, and countries round the Baltic	60,000	
France, Spain, Italy, Turkey in Europe, the Levant, &c	55,000	
The United States	90,000	
Canada, Australia, &c	30,000	
		291,000

In 1880, the total quantity, imported into the United Kingdom, was 1,546,451 cwts., of which 850,000 cwts. were imported from Ceylon and other British possessions, the computed real value being £6,861,130, or about 10*d.* per lb. The quantity ratained for home consumption during this year was about 360,000 cwts., on which a duty of 14*s.* p. cwt. in the raw state, and 2*d*, per lb. in a kiln-dried, roasted, or ground condition was leviable.

COFFEE BUG (*Lecanium coffeæ*), an insect of the Coccus (q. v.) family, which lives on the coffee-tree, and is often extremely destructive to coffee-plantations. It has of late years devastated some of these in Ceylon. To check its ravages, the experiment was tried of introducing into the plantations the red ant (*Formica smaragdina*), abundant in many of the gardens and jungles of the island, which feeds greedily on the C. B.; but the fierce assaults of the ants on the naked skins of the Malabar coolies, made them threaten to leave the estates.

CO'FFEE-TREE, KENTUCKY. See GYMNOCLADUS.

CO'FFER, in Fortification, is one particular kind of *Caponnière* (q. v.).

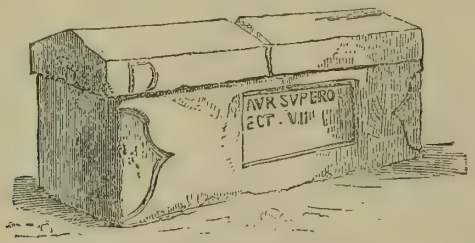
COFFER, a deep panel in a ceiling, also called a cassion.

COFFER, a casket for keeping jewels or other valuables. Caskets and chests were sometimes made of iron, but more frequently of wood.

CO'FFERDAM, a water-tight structure used in engineering for excluding the water from the foundations of bridges, quay-walls, &c., so as to allow of their being built dry. Cofferdams are generally formed of timber piles driven close together (called sheeting) in two or more rows, according to the depth of water and the nature of the bottom; the space between the rows, which may vary from four to ten feet, being spooned out, down to the solid and impervious bottom, and filled up with clay puddle. Sometimes they are made of only one row of piles of the full height, calked above low-water, with a low or dwarf row outside to confine the puddle up to that level, or, where there is no wave or current, with a mere bank of clay thrown against the outside; and occasionally the upper work is formed of horizontal planking, fixed on open main piles, and calked in the joints. When the bottom is rock, so as to prevent piles being driven, and is not much below low-water, cofferdams are occasionally formed of two stone-walls, with a space between filled with clay.

The cofferdams before spoken of are all what are called high-water dams, and exclude the water at all states of the tide. They require to be provided with sluices, to allow of the water, when first to be excluded, getting out during the ebb, and to shut against it during the flood. The remainder of the water, and all leakages, must be got rid of by pumps, generally worked by a steam-engine. For moderately shallow foundation, and more especially where there is a great rise and fall of tide, tidal-dams are often used. These are sometimes made of sheeting piles, but are often boxes formed of planking or of iron, weighted and sunk into the ground by digging inside in the same way that wells are sunk. These dams can only be used for a couple of hours of thereabouts at low-water, and, of course, require to be pumped out every tide. All cofferdams require to be strongly shored within, to prevent their being forced inwards by the pressure of the external water; and the rows of piles require to be strongly bolted together, to overcome the pressure of the clay puddle, which otherwise would burst them.

CO'FFIN (Lat. *cophinus*, Gr. *kofinos*, in both languages signifying a basket, coffer, or chest, but never a coffin.) In the ordinary English sense of the word, a C. is a chest or box in which dead

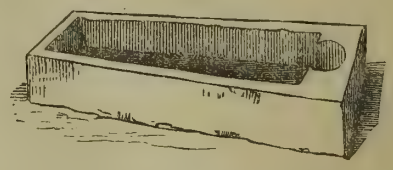


Roman Stone-coffin, found at York,

bodies are buried or deposited in vaults; but the term is also applied to a mould of paste for a pie, and in Printing, to the wooden frame which encloses the stone on which the form is imposed. In farriery, it signifies the hollow part of a horse's hoof. It is in the first of these significations alone that we shall consider it here.

It has been keenly disputed amongst scholars, whether it was more usual with the Greeks to bury their dead, or to burn them (see BURIAL); but both customs unquestionably prevailed, and coffins, in the modern sense, were consequently known in Greece. They were called by various name (*soroi*, *púeloi*, &c.), and composed of various materials, the most common being baked clay, or earthenware. Their forms also varied, sometimes resembling those which we use, sometimes consisting of a narrow triangular box, the undermost side of course being considerably broader than the others. In Rome, the ancient practice was to bury the dead, not to burn them; though under the Empire, and previous to the recognition of Christianity, the latter custom became almost universal. The C. in Rome was called *arca* or *loculus*, and was frequently made of stone, sometimes of a peculiar kind of stone brought from Assos, in Troas, which was said to consume all the body except the teeth in forty days, and which, from this circumstance, was called sarcophagus—an eater of flesh. See SARCOPHAGUS. Many Roman stone-coffins have been found in this country. The simplest of all coffins was that used by the British Celts and other rude nations, consisting of unhewn stones set on their edges, so as to cover the sides and ends of the grave, one or more flat stones being then laid over the body to form a lid. To these succeeded stone-coffins, which were commonly used for persons of the higher classes in Saxon times, and throughout the whole of the middle ages.

From Bede, however, we learn that the Saxons occasionally employed wood; and the common people both then and in the subsequent Norman and English eras, were simply wrapped in cloth, and



Stone-coffin, Temple Church, London.

so put into the ground. The same custom seems to have been followed with monks down to a comparatively recent period. Stone-coffins were generally of a single block, commonly tapering from the upper end. In the hollow for the reception of the body, there was generally a part peculiarly fitted for the head, and a hole in the bottom to allow of the juices of the decaying body to escape.

These coffins, for the most part were not buried very deeply in the earth, and were frequently placed so near the surface that the lids were visible, which, within a church, often formed part of the pavement. Sometimes they were even above the ground altogether, and thus became the originals of altar-tombs. These lids were often covered with elaborate sculpture, representing crosses and other ornaments. Leaden coffins were occasionally used in the middle ages, as those recently brought to light in the Temple Church in London testify, but the slight wooden cases now in common use appear to be of comparatively recent origin. See Strutt's *Manners and Customs*, and Gough's *Sepulchral Monuments*.

CO'GGESHALL, a town in the north-east of Essex, on the left bank of the Blackwater, 44 miles north-east of London. It lies partly on low ground, near the river, and partly on some gentle ascents rising from it. There is an endowed grammar-school, founded by Sir Robert Hitcham. The church is one of the finest in Essex, and has been recently restored at great cost. It has manufactures of silk, velvet, and isinglass. Pop. (1871) 2916. It is supposed to have been the Roman *Canonium*, and the remains of a Roman villa have been found. It has the ruins of a Cistercian abbey, founded by King Stephen in 1142.

COGNAC, a town of France, in the department of Charente, with a pleasant situation on an old castle-crowned hill overlooking the river Charente. C. is celebrated as the place where the best brandy in France is manufactured, to which it gives its name. Not half the quantity of so-called *Cognac* brandy, however, is manufactured here. The cultivation of the vine and distillation of brandy form the chief industry of the inhabitants of the district. Francis I. was born here. Pop. (1876) 13,811.

CO'GNATE. See AGNATE.

COGNI'TION AND SA'SINE, in Scotland, a form of entering an heir in burgage property. See CONVEYANCING.

CO'GNIZANCE, a term used in a loose manner in Heraldry, sometimes to signify a Crest (q. v.), sometimes a Badge (q. v.), or other distinguishing mark.

COGNOSCE'NTI (Ital. from Lat. *cognosco*, to know), persons professing a critical knowledge of works of art, and of a somewhat more pretentious character than amateurs.

COGNO'VIT—viz., *actionem* (he has confessed the action), in the law of England, is the defendant's written confession that the plaintiff's cause against him is just and true. A C. usually proceeds on the condition that defendant shall be allowed a certain time for the payment of the debt or damages and costs; and it impliedly authorizes the plaintiff's attorney to do everything necessary to obtain judgment.

COHABITA'TION, in the law of Scotland, means living at bed and board together, like man and wife, and being reputed to be such. These circumstances, when fully established, are held to afford sufficient proof that the contract of marriage between the parties has actually been constituted by their mutual consent.

CO-HEI'R AND CO-HEI'RESS, one of two or more persons, among whom an inheritance is divided. See HEIR, SUCCESSION.

COHE'SION is the name given to that species of Attraction (q. v.) by which the particles of matter are held together so as to form bodies (see ADHESION), and its measure is the resistance which bodies offer to any mechanical force tending to separate their parts. In gaseous bodies C. is altogether wanting; their atoms even repel one another. In liquids, notwithstanding the ease with which the particles slide on one another, the operation of C. is distinctly seen in the formation of drops. C. is strongest in solids; and degrees of C., in this case, are much the same thing as degrees of solidity. It is the force of C. that constitutes the strength of materials (q. v.). After the particles of a body have been completely separated, it is found that through C. they will reunite, if pressed sufficiently close together. Two clean, smooth, freshly cut pieces of lead placed together, will cohere so as to require a very considerable force to separate them; and it has not unfrequently happened in plate-glass manufactories, that polished plates of glass have cohered so completely that they have been cut and worked as a single piece.

If the particles of matter had no property in relation to one another, except their mutual impenetrability, the universe, it has been said, would be like a mass of sand, without variety of state or form. As it exists, however, it demonstrates the cross action of several universal properties of matter. Among those which most affect its state and form, are heat and cohesion. It may be said that bodies assume the solid, liquid, or aëriform states, just according to the proportion that the C. of their particles bears to those forces which, like heat, tend to separate them. See HEAT. Upon modifications of the cohesive force, and its relations to other molecular forces, would seem to depend such properties as elasticity, brittleness, ductility, &c.

COHESION-FIGURES, a remarkable class of figures produced in liquids by the action of their natural cohesive attraction for the surfaces of other liquids or solids on which they are deposited, or by induced cohesive attraction effected by the means of electricity. They may be described under four heads: (1) The Surface-cohesion Figures of Tomlinson; (2) The Submersion-figures of Tomlinson; (3) The Breath-cohesion Figures of Strethill Wright; (4) The Electric-cohesion Figures of Strethill Wright.

1. *The Surface-cohesion Figures of Tomlinson.*—This class of figures was submitted to the Chemical Section of the British Association by Mr. Charles Tomlinson of King's College, London, in solution or diffuses itself over the surface. He stated that each figure is characteristic of the fluid employed, and that any change in the chemical or molecular state of the fluid is attended with a corresponding change in its 'cohesion-figure.' Hence he recommended that these figures should be applied to the qualitative analysis of various liquids whose ordinary methods of testing were inoperative or inadequate. *Cohesion analysis*, performed as he directs, has been applied with signal success in the verification of oils 1861. He showed that a drop of an 'independent liquid,' such as an oil, alcohol, or ether, when gently placed upon chemically clean water, spreads itself out into a definite figure as it enters into

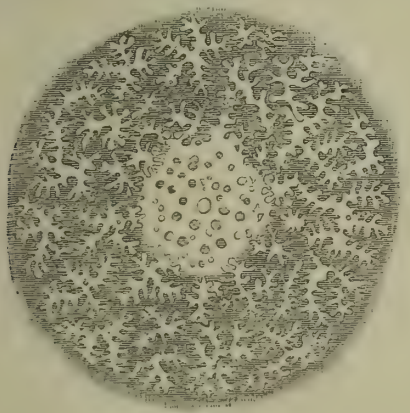


Fig. 1.

and balsams, and as a ready means of indicating the changes which take place in those bodies by age or oxidation. The cohesion-figures of Tomlinson, from their great beauty and variety, combined with the exquisite harmony of coloring displayed by many of them, have been employed, like those of the kaleidoscope of Brewster, to suggest forms for the pattern-designer.

In the production of cohesion-figures, water was the receiving surface generally employed by their discoverer; but in certain cases, he also employed other fluids, such as mercury, acetic acid, cocoa-nut oil, and castor oil in the cold state; and spermaceti, white wax, lard, and sulphur in a state of fusion. On each of these substances, the liquid to be tested formed a different and characteristic figure, and hence additional means of comparison and verification were afforded. Fig. 1 shows the surface-cohesion figure of oil of lavender on water.

2. *The Submersion figures of Tomlinson.*—In the *Philosophical Magazine* for June 1864, this author brought forward a new series of cohesion-figures of liquids, in which the drop, being of great specific gravity, instead of forming a figure on the surface, sank beneath it, and formed a figure as it slowly made its way to the bottom of the vessel. In order to exhibit these phenomena, he employed a column of liquid in a cylindrical vessel. He states that a solution of cochineal dropped into water formed a figure typical of a large class of these figures. A drop laid on the sur-

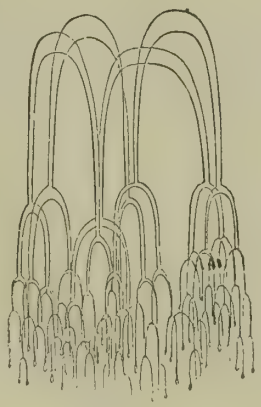

Fig. 2.

Fig. 3.

face sank down, opened into a ring, which became depressed at two opposite points; from these points, lines of fluid descended, which terminated in secondary rings; the secondary rings, in like manner, drooped down into lines carrying tertiary rings, and so on, until the lower part of the vessel became crowded with a complicated system of drooping rings and lines. Oil of lavender in a column of alcohol, fusel oil in paraffine oil, in benzole, in ether, &c., gave various and distinctive figures. He found that similar figures were obtained by the use of oils dropped into columns of hot spermaceti, lard, wax, &c.; and that these figures underwent considerable variation under the influence of change of temperature. Fig. 2 shows the submersion-figure of oil of lavender in alcohol; fig. 3, that of fusel oil in paraffine oil. We have already stated that each of these figures, whether surface-figures or submersion-figures, is characteristic of the fluid which forms it; and Tomlinson considers, with regard to the *surface-figure*, that it is a function of the cohesive force and diffusibility of the liquid, and the adhesion of the surface on which it is deposited: he also considered that it might be a function of the solubility and the diffusibility of the fluid in question, or of the solubility, the density, and the molecular attraction; while with regard to the *submersion-figure*, he thought each figure to be a function of the solubility, the density, and the molecular attraction.

3. *The Breath-cohesion Figures of Strethill Wright.*—These figures were discovered by Dr. Strethill Wright of Edinburgh, and communicated to the Royal Scottish Society of Arts on December 12, 1864. This author, who had long been engaged in observing phenomena connected with the modification of cohesive attraction produced between solids and fluids by heat and electricity, was induced to take up the subject afresh by the publications of Tomlinson, and one of the results was the production of his so-called 'breath-cohesion figures.'

He employed as the recipient surface a freshly-split, and therefore chemically clean, surface of mica; on this he placed a single drop of the fluid to be experimented on. He then breathed upon the surface, and instantly the drop flashed out into a figure characteristic of the fluid of which it was composed. By this means, a variety of substances, such as vegetable extracts, tinctures, and essential oils, and animal fluids, such as serum, vaccine lymph, bile, mucus, and urine in its various pathological conditions, could be examined. By dusting the figures with hair-powder or lycopodium, he was also enabled to render them permanent, and

to exhibit them in his lectures, expanded to a diameter of fourteen feet by the oxyhydrogen microscope. Fig. 4 shows the cohesion-figure of vaccine lymph; fig. 5, that of urine containing a small

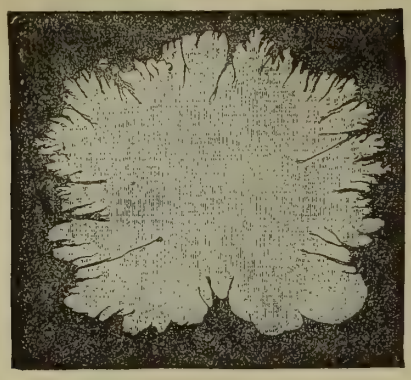

Fig. 4.

proportion of bile; fig. 6, oil of bitter almonds. In general appearance, the breath-cohesion figures bear a strong resemblance to vegetable forms, especially to the fronds of the *Desmidieæ*. In many of them, as in the *Desmidieæ*, a very distinct bilateral symmetry is apparent. Others again, simulate the forms of the larger *Algæ*. A great many are resplendent with the hues of the soap-

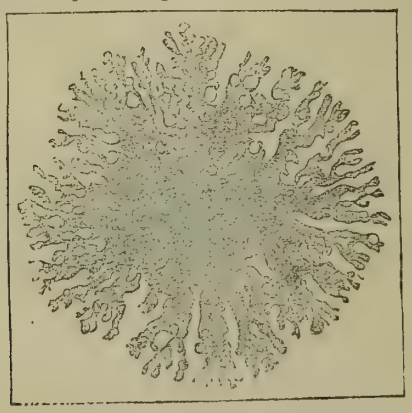

Fig. 5.

bubble, arranged in concentric bands and curves of excessive beauty; while others are veined throughout so as to resemble sections of agate. Dr. Wright considers that the breath-cohesion figure is the product of electric attractive force developed on the freshly-split mica, as a well-known consequence of cleavage.

4. The *Electric-cohesion Figures of Strethill Wright*.—These

Fig. 6.

figures were described by Dr. Wright to the Royal Scottish Society of Arts on April 11, 1864, and are produced by electrifying drops of various fluids placed on a clean plate of glass, vulcanite, mica, or other smooth non-conducting substance. By this method, an endless variety of beautiful dendritic figures are produced, differing not only with the fluid employed, but also with the slightest change in the character of the surface on which it is placed, and with the electricity, whether positive or negative, which is imparted to the drop. The electric-cohesion figures are produced in the following manner: A sheet of plate-glass is laid upon a plate of blackened metal, and in the center of the glass a drop of the fluid to be operated on is deposited with a clean glass rod. The metal plate and the drop are then connected with the opposite

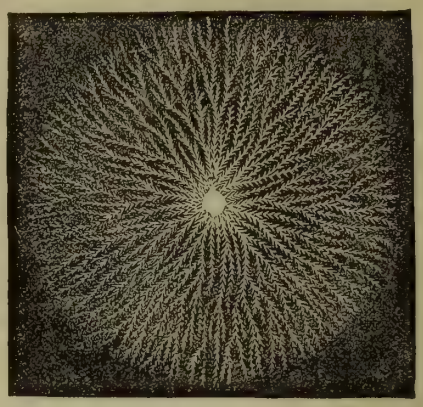

Fig. 7.

poles of an induction coil (capable of giving a spark of about half an inch in length) in full action, and immediately branches protrude from the drop, which slowly creep over the glass until they closely cover a circle of four or five inches. The accompanying figure (fig. 7) shows that produced on a surface of mica by the positive pole from a solution of cyanide of potassium. Sulphuric acid, and solutions of potash, deliquescent salts, and organic fluids, give the best figures; while nitric and muriatic acids and distilled water do not form figures under the electric influence.

COHOES, a city of New York, U.S.A., eight miles north of Albany. It has very extensive manufactures of cotton and hosiery. Pop. (1880) 19,417.

CO'HORT, in the ancient Roman armies, was a portion of a legion, consisting usually of 600 men. Generally, there were ten cohorts to a Legion (q. v.).

COHU'NE OIL, a fixed oil obtained from the kernel of the fruit of *Attalea Cohune*, a palm (see ATTALEA). The oil burns twice as long as the best cocoanut oil. The tree attains a height of about forty feet, but its leaves are thirty feet long.

COIF (Fr. *coiffe*, Ital. *cuffia*, a cap), a covering for the head in general, but more especially for the circular portion on the crown, which the Roman Catholic clergy are in the habit of shaving, and which is thence called the tonsure. The general meaning of the word is preserved in the verb to coif, coiffed, &c., and still more decidedly in the noun *coiffure*, which, so late as Addison's time, was English as well as French. Its special signification is now limited to the caul or cap worn by serjeants-at-law. It is now the only reminiscence of the tonsure amongst lawyers. On attaining the DEGREES OF THE C., or, what is the same thing, becoming a serjeant, a barrister retires from the Inn of Court by which he was called to the bar, and becomes a member of Serjeant's Inn. See SERJEANT-AT-LAW.

COIF, among the armor of the middle ages, was a sort of defensive hood, surmounted by a helmet, sometimes continuous with the hauberk, and sometimes separate.

COIMBATO'RE, a city in the province of Madras, capital of a district of the same name, situated near the left bank of the Noyel, a tributary of the Cauvery from the right, in lat. 11° N., long. 77° 1′ E. It occupies the south declivity of the Neilgherries, 1483 feet above the sea, near the point where those otherwise isolated mountains connect themselves with the Western Ghauts. Almost immediately to the south of the junction of the two chains, the remarkable depression of Palghatcheri traverses the Western Ghauts from east and west, so as to afford a free passage for both the monsoons—the north-east and the south-west—in their respective seasons. C., which contains about 2000 houses, from its proximity to this great gorge, is admirably ventilated during most of the year. This peculiarity, backed by the elevation, tends to promote the salubrity of the place, which, however, is seriously impaired by the brackish character of the wells. In the neighborhood is a very large tank. Pop. (1871) 35,310. C. is on the line of railway from Madras to the west coast.

COIMBATORE, a district in the province of Madras, in lat. 10° 14′—12° 19′ N., and long. 76° 36′—78° 16′ E., containing 7432 square miles and (1871) 1,763,274 inhabitants. Lying to the north-east of the state of Cochin, it is almost entirely beyond the Western Ghauts. Besides the capital above described, there are in the district the towns of Palaghat and Darrampoor

COI'MBRA, a city of Portugal, capital of the province of Beira, situated on the right bank of the river Mondego, here crossed by a stone bridge, 110 miles north-north-east of Lisbon. Built round a conical hill, rising abruptly from the river, and surrounded by olive-gardens and orange-groves, its appearance from a distance is as beautiful as it is picturesque. Interiorly, however, it is not so attractive, its streets being steep, narrow, and dirty. Great historical interest attaches to C., which appears to have been originally built by the Goths. From them it passed to the Moors, from whom it was finally conquered in 1064, by Fernando the Great, aided by the gallant Cid. On the erection of Portugal into a kingdom, in 1139, C. was made the capital, and continued so about two centuries and a half. Of the public buildings, the most noteworthy are the cathedral, the churches of San Francisco and San Salvador, the convents of Santa Cruz and Santa Clara, and a fine aqueduct of 21 arches, dating from the 16th century. The university of C., the only one in Portugal, was originally established in 1290, but permanently transferred here in 1537. It has 46 chairs, and about 1000 students, many of the latter being Brazilians. Attached to the university are museums, an observatory, a botanical garden, and a library of 60,000 volumes. C. has manufactures of linen, woollen, earthenware, and combs. Pop. 13,200.

COI'N, a town of Andalusia, Spain, about 21 miles west of Malaga. It is pleasantly situated on a declivity, with wide clean streets, and environed with fine public walks and gardens. It has manufactures of linen and woollen, soap, paper, &c., and in the vicinity, marble and jaspar are obtained. Pop. 8200.

COIN, COINING. See MINT, NUMISMATICS, MONEY, CURRENCY.

COI'NCIDENCE. If, when two geometrical figures are laid upon one another, the boundaries of the one fall everywhere exactly upon those of the other, the figures are said to *coincide*. Such figures are considered as identical; and this C. is taken by Euclid as the test of equality, or rather, as the definition of equality. It is not necessary, in geometry, actually to lay one figure upon the other; if we know the equality of certain parts, we can infer with certainty that the whole figures *would* coincide, if superimposed, and that the other parts are therefore equal too.

COINING, in Law. The privilege of C. money being an exclusive prerogative of the crown, the crime of counterfeiting the king's money, as it was called, was declared to be treason, both by the common law of England and by many statutes. In Scotland, there continued to be some differences in regard to this crime, even after the Union had extended the treason laws of England to that kingdom.

The whole of the legislation on this subject was at length repealed, and a general act passed for the whole kingdom (2 Will. IV. c. 34). By this statute it is enacted—1. That any one who shall fabricate a coin in imitation of a current *gold* or *silver* coin —or gild silver, or color any counterfeit gold or silver coin—or shall alter silver coin with intent to make it pass for gold coin—or copper coin, to make it pass for gold or silver coin, shall be punishable with transportation for life, or for a term not less than seven years, or with imprisonment for a term not exceeding four years. 2. That any one who shall impair, diminish, or lighten gold or silver coin, shall be punishable with transportation for seven years, or imprisonment for three years. 3. That any one who shall buy, sell, receive, pay, or put off counterfeit gold or silver coin for a lower value than its denomination, or shall import counterfeit gold or silver coin, knowing it to be such, shall be punishable with transportation for life, or seven years, or with imprisonment for not more than four years. 4. The uttering (q. v.) of base coin is punishable with imprisonment for a year. 5. By subsequent clauses, the possession of false money, with intent to utter the same; or of instruments for its fabrication; the conveying such instruments out of the Mint without authority; the fabrication of copper coin, and the altering of current coin so as to make it pass for coin of a higher denomination, are declared to be offences all of which are visited with punishments resembling those above mentioned.

In order to bring these offences within the limits of the statute, it is not necessary that the resemblance of the false to the true coin shall be very perfect; but if it be not such as to deceive a person of ordinary observation, the attempt to bring it into circulation is fraud, and not uttering.

COIR, or CO'COA-NUT FIBRE, the fibre of the husk of the cocoa-nut, much used for making ropes, mats, &c. The husks are steeped in water, in pits, for six months, or even for a year, and then beaten with a stick till the fibre readily separates. C. is now well known as one of the best materials for cables, on account of its lightness, elasticity, and strength. C. ropes are produced in great quantity in the Laccadive Islands. They are entirely made by the hand—chiefly by women—without the aid of machinery of any kind. The manufacture of cocoa-nut mats is now carried on to a considerable extent in Britain, the husks being imported for that purpose. This manufacture is one of the branches of industry in which children are employed in the industrial or ragged schools, and criminals in prisons.

COIX. See JOB'S TEARS.

COJUTEPE'C, a town of San Salvador, Central America. It is situated 15 miles to the east of the city of San Salvador, destroyed by earthquake in 1854, and was the seat of government from that year until 1858. C. has a population of 10,000.—At the distance of a few leagues, a lake of the same name measures 12 miles in length by 5 miles in average breath; and in windy weather it assumes a green hue, often casting on its shores vast quantities of dead fish.

COKE is the fuel generally used in locomotive engines, and is obtained by the heating of coal in ovens, or other arrangements where little air is admitted. Caking coal is most suitable for the manufacture of coke. The process is conducted either (1) in heaps or ridges, or (2) in ovens. The coking in heaps is called the Meiler method, and consists in placing the coal in round stacks, or in long ridges, occasionally to the length of 200 feet. During the building of the coal, wooden stakes are driven in, which are afterwards taken out, and lighted coal introduced at numerous places at the same time. As the coal becomes heated, much smoke and vapor are evolved, which mainly consist of tar, water, and coal-gas. Whenever the smoke ceases to be evolved, the process of coking is regarded as concluded, and the mound or ridge of red-hot cinder, or C., is covered over with fine coal-dust, which, excluding the air, extinguishes the combustion. At places where the operation of coking is conducted regularly on the large scale, it is customary to erect brick chimneys or columns, about the height of the proposed mound, and to build the coal round these, placing the larger masses in the centre, the smaller pieces outside, and ultimately covering the whole with fine coal or dross.

A more economical plan of preparing C. is to introduce the coal into fire-brick ovens. The coal is introduced by the top, and being lighted, a little air is admitted by openings in front. Whenever the coal ceases to evolve smoky vapor, every opening is closed, and the oven is allowed to cool down for 12 to 24 hours. A door in front is then opened, and the C. being raked out whilst still hot, water is thrown upon it, to stop the combustion. Small coal may be used if it belongs to the caking kind; and a little water sprinkled over it, causes the caking operation to proceed more completely. The proportion of C. obtained from coal in Great Britain ranges from 54 to 73 per cent., so that in round numbers the better class of coal for this purpose loses a fourth of its weight. At the same time, the coal increases in volume to the extent of about one-fourth.

C. is a hard, brittle, porous solid, with a color varying from iron-gray to blackish-gray, and more or less of a metallic lustre, and does not soil the fingers. It absorbs moisture from the air, sometimes to the extent of 30 per cent., and contains an amount of ash ranging from ½ up to 15 per cent. It gives off no smoke in burning, is of great value as a fuel, evolving a very large amount of heat, and is used, not only in locomotive and other furnaces, but also in the smelting of metallic ores.

COKE, SIR EDWARD, a distinguished English lawyer and judge, was born at Mileham, in Norfolk, on the 1st of February, 1551—1552. Educated at the free grammar-school of Norwich, and at Trinity College, Cambridge, he passed thence to Clifford's Inn, and subsequently to the Inner Temple, to study law, and was called to the bar in April, 1578. His great ability, legal learning, and the tact he exhibited in the conduct of his cases, secured him an immense practice on the very threshold of his career. In 1586, he was appointed recorder of Norwich; in 1592, recorder of London, a position he resigned the same year for the solicitor-generalship.

In the following year, he was elected member of parliament for the country of Norfolk, and was chosen Speaker of the House of Commons. In 1594, he was made attorney-general, an office he continued to hold until 1606, when he was appointed Chief-justice of the Common Pleas, the duties of which position he discharged in a manner that secured for him a great reputation. Upright and independent, with a high notion of the dignity and importance of his office, he did not, in an age of judicial sycophancy, hesitate to oppose any illegal encroachment by royalty. The court thought to win him over by making him, in 1613, Chief-justice of the King's Bench. But here he proved equally incorrigible, maintaining, among other things, that the king had no power to stay the proceedings in a court of justice, even when his craven-hearted colleagues begged the royal pedant's pardon on their knees for ever having entertained such an opinion. This was too much; C., in a few months (Nov. 1616), was relieved from his chief-justiceship; but in no long time after, the royal favor was in some measure again extended to him. His support of liberal measures in parliament, however, soon brought him into

trouble with the court-party, and in 1621—1622, he suffered seven months' imprisonment in the Tower. In the third parliament of Charles I. (1628), C. took an active part in framing the celebrated Bill of Rights, and it was in a great measure owing to his advocacy that the Lords were induced to agree to it. C. died 3d September 1633. He is now best known for his law treatise, *Coke upon Littleton, or the First Institute*, a work which is still the standard one on all questions of constitutional and municipal law in England. His other works are the *Second*, *Third*, and *Fourth Institutes*, *The Complete Copyholder*, and *Reading on Fines*; while his collection of law reports, which made an epoch in the history of law on their appearance, are still of great value for the profession.

COL (Fr. *neck*), in Geography, is a depression or pass in a mountain-range. In those parts of the Alps where the French language prevails, the passes are usually named cols—as the Col de Balme, the Col du Géant, &c.

COL' A'RCO, in Music, with the bow, in contradistinction to *pizzicato*.

CO'LA NUT, or KOLA NUT, the seed—not properly a nut—of *Cola acuminata* or *Sterculia acuminata*, a tree of the natural order *Sterculiaceæ*, a native of the tropical parts of the western coast of Africa, and cultivated in other tropical countries. There are two varieties of the tree—one with broad, and the other with narrow leaves. The natives of Guinea value the seeds very highly, believing that to take a portion of one of them before their meals, improves the flavor of whatever they may eat or drink. When sucked or chewed, cola nuts are generally asserted to render the flavor even of very putrid water agreeable; but see foot-note under TEA. They are said to possess properties analogous to Peruvian bark. They are of the size of a pigeon's egg, of a brownish color, and bitter taste. They are mentioned by almost all travelers in W. Africa.

CO'LBERG, or KOLBERG, a fortified seaport of Prussia, in the province of Pomerania, on the Persante, near its mouth in the Baltic, in lat. 54° 9′ N., long. 15° 34′ E. It stands on a hill, surrounded with swamps, which can be readily laid under water, and is chiefly remarkable for the protracted sieges which it has undergone. In 1102, Duke Boleslaus of Poland besieged it in vain. It endured long sieges in the Thirty Years' War, and in the Seven Years' War, and again in 1807, when it was most gallantly defended against the French. C. has manufactures of woollen, salt, and spirits; and salmon and lamprey fisheries. Pop. (1880) 16,027.

COLBERT, JEAN BAPTISTE, minister of finance to Louis XIV., was born at Rheims in 1619, and served his apprenticeship in a woollen-draper's shop. He afterwards went to Paris, where his talents introduced him to Mazarin, who soon employed him in most important affairs of state. On his death-bed, Mazarin, warmly recommended C. to the king, who, in 1661, appointed him controller-general of finances. C., who found the finances in a ruinous condition, immediately began his reforms. Fouquet, the superintendent under Mazarin, was found guilty of impoverishing the state by his maladministration, and imprisoned for life. C. next instituted a council of finance and a chamber of justice, to call to account the farmers of the state-revenues, who were forced to yield up all the resources of the crown of which they had fraudulently possessed themselves. The debts of the state C. also reduced by arbitrary composition. So complete and thorough was the change which C. effected, that in twenty years the annual revenue had risen to 116 million livres, of which 23 were spent in collection and administration; whereas, when the management of the finances was intrusted to him, the revenue amounted only to 84 million livres, and 52 millions were absorbed in its collection. C. did not rest satisfied with being a monetary reformer, but in various ways developed the industrial activity of the nation by state support. Commerce was extended, roads and canals—including that of Languedoc—were made. He organized anew the colonies in Canada, Martinique, and St. Domingo, and founded others at Cayenne and Madagascar. Made minister of marine in 1669, he found France with a few old rotten ships; three years later, she had a fleet of 60 ships of the line, and 40 frigates. C. improved the civil code, introduced a marine code of laws, as well as the so-called *Code Noir* for the colonies; and statistical tables of the population were first made out by his orders. While attending to material interests, he did not neglect the arts and sciences; all men of learning and genus found in C. a generous patron. The Academies of Inscriptions, Science, and Architecture were founded by him. In short, C. was the patron of industry, commerce, art, science, and literature—the founder of a new epoch in France. Notwithstanding the ingenuity of C., the unbounded extravagance of his master led him to raise money in ways objectionable to his reason, and to maintain war-taxes in time of peace.

He died 6th September 1683, bitterly disappointed, because his great services were but ill appreciated by the king. The people, enraged at the oppressive taxes, would have torn C.'s dead body in pieces, but for the intervention of the military, and his burial by night. Because he had brains without birth, he was vexed and persecuted, both in private and public life, by those who, having birth, lacked brains.

CO'LCHESTER, a parliamentary and municipal burgh and river port, in the north-east of Essex, on the south bank of the Colne, 12 miles from the sea, and 51 miles north-east of London. It stands on the sides and top of an eminence, and is well built. It has a quay for vessels of 150 tons at the suburb called Hythe. Its former manufactures of baize and silk have both declined. The important oyster fishery has suffered of late. Pop. (1881) 28,395. C. returns two members to parliament. In 1880, 1013 vessels of 55,709 tons entered, and 1025 of 56,504 cleared the port. C. is the British *Camulodunum* and the Roman *Colonia*. The town-walls, castle, and many churches and other buildings, consist of Roman brick. Great quantities of Roman remains have been found here, bushels of coins of many emperors, vases, urns, lamps, rings, bracelets, pavements, pateræ. C. was ravaged by the plague in 1348, 1360, and 1665. The ruins of the castle, built of cement-stone and Roman brick soon after the Conquest, have walls 11 to 30 feet thick. There are the ruins of an abbey, founded by Eudo the 'Dapifer,' and the remains of a priory.

COLCHESTER, CHARLES ABBOT, LORD, a distinguished legal and administrative reformer, was born at Abingdon, Berkshire, October 1757. He was educated at Westminster School, and Christ's Church College, Oxford, and afterwards studied for the bar. Returned to parliament in 1795, he in the very next year succeeded in effecting an improvement in the legislation regarding temporary and expiring laws; and it is due to his exertions that municipal bodies receive a copy of all new acts as as soon as they are printed. The country is mainly indebted to him for the royal record commission, the proceedings of which he for many years superintended. But the greatest service he rendered the country was in obtaining an act for taking the census of the population, the first enumeration under public authority in modern times. It was on his suggestion, too, that the Private Bill Office, which has done much to facilitate parliamentary business, was established. In 1802, he was elected Speaker of the House of Commons, the duties of which high and honorable office he continued to discharge with as much impartiality as distinction, until May 1817, when ill health compelled him to resign. He was then elevated to the peerage as Baron Colchester, with a pension of £4000 a year. He died May 29, 1829.

CO'LCHICUM, a genus of plants of the natural order *Melanthaceæ*. The species which are few in number, are stemless, with flowers half subterranean like the crocus, the limb of the perianth and part of tube only rising above ground. The flowers much resemble crocus-flowers, but are readily distinguished by having six instead of three stamens, and three styles instead of one. The seed-vessel does not remain to ripen under ground, as in the crocus, but after the flowering is over, rises in the form of three little follicles slightly adhering to each other, on a lengthened stalk. The only British species is *C. autumnale*, the MEADOW SAFFRON, sometimes also, but incorrectly named *Autumn Crocus*, which is plentiful in meadows and pastures in some parts of England, and of the continent of Europe. It scarcely occurs as a native plant in Scotland. The flowers are pale purple; they appear in autumn, unaccompanied by any leaves; the leaves, which are large and broadly lanceolate, appear in spring, when the stalk which bears the ripening fruit arises amongst them. The whole plant is very acrid and poisonous, chiefly owing to the presence of an alkaloid called *Colchicine* or *Colchicia*. Cattle are not unfrequently injured by it in pastures where it abounds. It is, however, not difficult to extirpate, the repeated pulling of it by the hand, as it appears above ground, being sufficient for this purpose; the roots soon become exhausted, and die. It is a valuable medicinal plant, and is much administered, in small doses, to allay the pain of gout and rheumatism. Repeated doses produce vomiting, purging, increase of the urinary secretion, and profuse perspiration. C. is generally supposed to have been the basis of the *Eau medicinale*, long a celebrated empiric remedy for gout. The parts chiefly used for medicinal purposes are the corm (popularly called the root) and the seeds. The

Meadow Saffron (*C. autumnale*):
a, capsule.

seeds are round, brown, rather larger than mustard-seed; and fatal accidents have occurred from their poisonous nature.—Other species of C. appear to possess similar properties The *hermodactyls* of the druggists' shops, which for many centuries have enjoyed an extensive celebrity for soothing pains in the joints, and are brought from the Levant, are believed to be the corms either of *C. variegatum* or *C. bulbocodioides;* the former of which is probably the C. of the ancients.—*C. autumnale* is not unfrequent in flower-borders, particularly a variety with double flowers.

CO'LCHIS, a province of ancient Asia, on the east coast of the Pontus Euxinus or Black Sea, situated north of Armenia, and south of the Caucasus. It now forms the Russian province of Imerethia, with the districts of Mingrelia and Guria. It was celebrated in the very earliest times as the native country of Medea (q. v.), and the goal of the Argonauts (q. v.), and was afterwards better known to the Greeks as the seat of some colonies of the Milesians. It was noted for its wine and fruits. The Colchians, according to Herodotus, were of Egyptian descent, being relics of the army of Sesostris, which he attempts to prove by various arguments. In the time of this historian they were subject to Persia; subsequently, they threw off their allegiance, and were ruled by kings of their own; the country then came under the dominion of Mithridates, king of Pontus; afterwards, there were princes of Colchis dependent on the Romans. The principal town was Dioscurias (called under the Romans Sebastopolis), and now Isgaur; the principal river the Phasis.

COLD is the term by which we signify a relative want of sensible heat. There are, therefore, no determinate boundaries between cold and heat, and it is a mere arbitrary distinction to call the degrees of the thermometer below the freezing-point, degrees of cold. When the atmosphere, or any substance which comes in contact with our body, contains less heat than the body, it absorbs heat from the body, and we call it cold. See HEAT.

The physiological action of C. on the animal organism requires a brief notice. All animals (the warm-blooded animals to the greatest extent) have a certain power of maintaining the heat of the body, in defiance of external cold, as has been shown in the article ANIMAL HEAT. This power is mainly due to a process analogous to combustion, in which carbon and hydrogen taken into the system in food, are made to unite with oxygen derived from the air by respiration. If the combustible materials are not duly furnished, or if the supply of oxygen be deficient (as in various deceased conditions), there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hybernating animals) be lowered about 30° below its normal standard (which in birds ranges from 108° to 112°, and in mammals from 98° to 102°), the death of the animal is the result. The symptoms indicating that an animal or a man is suffering from a depression of the temperature of the body, are, retardation of the circulation of the blood, causing lividity of the skin, which is followed by pallor, in consequence of the blood being almost entirely driven from the surface through the contraction of the vessels; a peculiar torpor of the muscular and nervous systems at the same time manifests itself in an indisposition to make any effort or exertion, and in intense sleepiness. The respiratory movements become slower, for physiological reasons, which will be explained in the article RESPIRATION, and the loss of heat goes on, therefore, with increasing rapidity, till the fatal limit is reached, and death supervenes.

In hybernating animals (the marmot, dormouse, bat, &c.), the power of generating heat within their own bodies is very slight, their temperature following that of the external air, so that it may be brought down nearly to the freezing-point. At this low temperature, the vital actions are scarcely perceptible, but when the temperature is again raised, the vital activity returns. The respirations (in marmots) fall from 500 to 14 in the hour, and are performed without any apparent movement of the walls of the chest; the pulse sinks from 150 to 15 beats in the minute; and the animals can with difficulty be aroused from their torpor.—For additional matter bearing upon this subject, see the articles HIBERNATION, STARVATION, and DORMANT VITALITY.

C. is one of the most powerful depressing agents, and is a fruitful cause of disease, and even of death. Thus, it is observed, that whenever the temperature of the atmosphere is suddenly reduced, and particularly when it is reduced below the freezing-point, a considerable addition takes place to the mortality of the country at large. The effects of C. are, in ordinary circumstances, most apparent among the aged and the very young, and among those suffering from chronic disease; but when a very low temperature is long continued, even the healthy are sure to suffer, when impoverished so as not to have sufficient means of external warmth in their homes. The most direct effects of C. are in the production of what is commonly called frost-bite. The part so affected is deprived of circulation, and does not bleed on being wounded; it is marble-white or livid, and has lost all sensibility; and if the exposure is continued, or reaction is brought about too rapidly, it is apt to pass into gangrene. The extremities, especially the fingers and toes, and the tip of the nose, are the parts most liable to frost-bite. The remedy is exceedingly gradual restoration of the temperature, with gentle friction. In Russia, friction with snow is commonly resorted to, so as to secure against too rapid reaction. The effects of C. upon the general system are described by arctic voyagers, and a medical detail of them may be found in Baron Larrey's interesting account of Napoleon's disastrous campaign in Russia. The circulation is much depressed; diarrhœa and rheumatic pains are frequent; to the end, the general insensibility becomes impaired, and an irresistible tendency to lie down is experienced, with excessive drowsinesss. If this be not resisted, death is certain. The disease commonly termed 'a cold' has been already described under CATARRH.

COLD CREAM is the term applied to a preparation of fatty substances, which is used as a mild and cooling dressing for the skin. It may be prepared by heating gently four parts of olive-oil, and one part of white wax, till a uniform liquid mass is obtained, when a little color and scent may be added; the mixture is then allowed to cool, but must be stirred the whole time, so as to prevent the concretion and consequent separation of the wax. Another variety is prepared with the addition of hogs' lard, but the latter sometimes contains common salt, and is liable to become more or less rancid. C. C. softens the skin, and tends to promote the healing of wounds and of chapped hands.

COLD PIT, or COLD FRAME, in Gardening, is a simple contrivance for the preservation of half-hardy plants throughout the winter, and consists of a pit, seldom more than three feet in depth, and often not so much, walled or unwalled, and covered with a frame, either thatched or glazed.

CO'LDSTREAM, a border town in the south of Berwickshire, on the left bank of the Tweed, 15 miles south-west of Berwick, and on one of the main routes from Scotlond to England. It is irregularly built on a high site. Pop. (1881) 1616. Near C. is the famous ford of the Tweed, where the Scotch and English crossed in former times, before the erection of Berwick Bridge. By this ford Edward I. entered Scotland in 1296, and near it he met the Scottish nobles, to settle the dispute of Bruce and Baliol about the crown of Scotland. By this ford also the Scottish army entered England in 1640. Here General Monk, 1659—1660, raised the regiment still known as the Coldstream Guards (q. v.). Being a border town, C., like Gretna Green, was formerly celebrated for its clandestine marriages.

CO'LDSTREAM GUARDS, a regiment in the Foot Guards (q. v.) or Household Brigade, is the oldest corps in the British army except the 1st Foot. General Monk, in 1660, raised a corps at Coldstream, which was at first called 'Monk's Regiment;' but when parliament consented to give a brigade of guards to Charles II., this corps, under the name of C. G., was included in it.

CO'LEBROOKE, HENRY THOMAS, an eminent Orientalist, was born in 1765. He early went out to India, where, having served in various civil capacities under the East India Company, he was appointed Sanscrit professor in the newly founded college at Fort-William. Afterwards he became a judge at Mirzapore, and subsequently held the appointment of President of the Board of Revenue. During his residence in India, he had gained an extensive knowledge of the literature of the Vedas and their commentators, as well as of the writings of ancient Hindu grammarians, metaphysicians, and mathematicians. A sound critical judgment marks all his writings. He was a director of the Bengal Asiatic Society; and many of the most valuable essays in the *Asiatic Researches* were contributed by him. These, with other papers, were afterwards republished as *Miscellaneous Essays*, in 2 vols., 1837.

He also made translations from the Sanscrit works on Hindu law, algebra, arithmetic, and mensuration, which were important contributions to the history of mathematics. Among his other publications, are a Sanscrit dictionary and grammar, and treatises on the philosophy and sacred Books of the Hindus. He died in London (where he had for some years been president of the Asiatic Society), March 10, 1837.

COLENSO. See NATAL, BISHOP OF.

COLEO'PTERA, or COLEO'PTEROUS INSECTS (Gr. *koleos*, a sheath; and *pteron*, a wing), an order of insects which, with a little change of limits and characters, has been recognized since the days of Aristotle. The number of species enumerated by naturalists, and of which examples are gathered in museums, amounts to many thousands. The C. are sometimes collectively called *beetles*, although that name is generally more limited in its application, and many of them are known by other names, as weevils, lady-bugs, &c. The glowworm and the blistering-fly (*cantharis*) belong to this order.

The C. may be described as four-winged insects, which have the first pair of wings converted into crustaceous wing-cases (*elytra*), and the second pair of wings folded crosswise under these when

not in use. In some of them, the membraneous wings are wanting, or rudimentary in one or in both sexes, for there is often a difference of the sexes in this respect: more rarely, the elytra also are wanting in one sex, as in the female glowworm. The head and antennæ vary extremely in different C., the antennæ often differ considerably in the male and female of the same species. The first segment of the thorax (*prothorax*) is greatly larger than the other two. The abdomen is united to the thorax by its whole width, and not by a stalk. C. have two composite eyes, and no additional simple or stemmatic eyes (*ocelli*). The mouth is fitted for cutting, gnawing, tearing, or chewing, but never at all for suction, and exhibits in the greatest perfection of development the complicated structure which belongs to the mouth of all the *masticating* or *mandibulated* insects. See INSECTS. The annexed cut exhibits the parts of the mouth of a beetle. A, the upper side; B, the under side; C, the parts separated; *a*, *a*, antennæ; *e*, *e*, eyes; *l1*, upper lip (*labrum*); *l2*, under lip (*labium*); *m*, upper jaws (*mandibles*); *mx*, lower jaws (*maxillæ*); *mp*, maxillary palpi; *lp*, labial palpi; *c*, chin (*mentum*). The upper jaws or *mandibles* are hard and horny in most of the C., but comparatively soft in those which feed on vegetable juices, or on putrescent animal matter. The food of the C. is very various: some prey on other insects, worms, &c.; some feed on carrion; some on rotten wood—some on wood in a fresh and growing state—some on the roots of grasses and other plants—some on grain—some on leaves—some on flowers, &c. The food of their larvæ is equally various; but perfect insects and larvæ generally agree in being very voracious. Their digestive organs exhibit great diversities, according to the kinds of their food. The C. are among the insects which undergo complete transformations, and of which the pupa is inactive. The larva (grub) is generally like a short thick worm, with a scaly head and mouth, generally with six legs, of which, however, some species are destitute. Coleopterous insects are distributed over all parts of the world, but are most abundant within the tropics, where also they attain their greatest size and greatest brilliancy of colors.

The splendor of the metallic tints exhibited by many of the tropical species is not excelled in nature. The order, however, contains also many species of dull hue, and sufficiently unattractive appearance. Many of the C. are noted for the mischief which they do to crops, stores of provisions, timber and articles of furniture, trees, &c.; few of them are of any immediate use to man, the principal of these being the blistering-flies or cantharides.

COLERAI'NE, a parliamentary and municipal borough and seaport, in the county of Londonderry, Ireland. It is situated on the right bank of the Bann, four miles from the sea, and 47 miles north-north-west of Belfast, with which it is connected by railway. It consists of a central square and several diverging streets. C. has manufactures of fine linen, leather, paper, and soap, and a large salmon and eel fishery, which produces a rent of nearly £5000. The river Bann has recently been deepened, so that since 1873 larger vessels reach the quay at C. In 1880, 413 vessels, of 54,119 tons burden, entered the port, and 405, of 53,169 tons cleared. The revenue of the borough was in 1875, £2463; its debt, £13,109. The population, in 1871, was 6082, of whom 1329 were Roman Catholics, 2090 Protestant Episcopalians, and 2124 Presbyterians; (1881) 6694. C. returns one member to parliament.

CO'LERIDGE, SAMUEL TAYLOR, was born at Ottery St. Mary, in the county of Devon, of which parish his father was vicar, on the 21st October 1772. He was educated at Christ's Hospital, and numbered Charles Lamb among his school-fellows. His acquirements in Greek were extensive; and before his 15th year he plunged boldly into the sea of metaphysics, and swam therein until the day of his death. His industry, if desultory, was great; he read whole libraries. Full of book-knowledge, and without ambition or any practical bent, he was on the point of apprenticing himself to a shoemaker, when his head-master interfered, and rescued to literature and thought his most distinguished scholar. A copy of Mr. Bowles's sonnets falling into his hands at this time, attracted him towards poetry, in which for a time he found rest.

In 1791, C. entered Jesus College, Cambridge. At the university, he displayed no mathematical aptitude; his whole mind was given to classics, and he obtained a prize for a Greek ode. He did not take a degree. During the second year of his residence at the university, in a fit of despondency, occasioned by an unsuccessful love matter, he quitted Cambridge for London, and enlisted in the 15th Dragoons, under the assumed name of Comberbach. He never advanced beyond the awkward squad, and he enjoyed to the close the reputation of being the worst rider in the corps. One of the officers luckily discovered his classical acquirements, and, becoming acquainted with his real history, communicated with his friends, and C. effected his discharge.

On his release, the poet proceeded to Bristol, and making the acquaintance of certain poetic enthusiasts—Southey was of the number—whose minds were somewhat unsettled by the revolutionary movement in France, he formed a scheme to emigrate to the banks of the Susquehanna, in North America, and there, in pastoral peace and plenty, to bring back the golden age to man. C. found, to his surprise, that before Paradise could be thus regained, money was indispensable; and as of *that* both he and his friends were absolutely devoid, the dream of 'Pantisocracy' had to be given up. About this time, Joseph Cottle, bookseller in Bristol, paid C. 30 guineas for a volume of poems, and after many delays and the advancement of additional sums, the volume was published. In 1795, he married Miss Fricker—his friend Southey on the same day wedding another sister—and removed to Nether Stowey, a village of Somersetshire, in which neighborhood Wordsworth was then staying. It was here, surrounded with beautiful scenery, and in daily communication with the graver and intenser spirit of his friend, that C.'s principal poems were composed. Here he wrote the *Ancient Mariner*, and the first part of *Christabel*, the music of which took captive Scott and Byron, and which was imitated by both with no remarkable success. At this time, C. was in theology a Unitarian, and preached frequently to congregations of that religious sect. In 1798, he visited Germany, and studied at Göttingen. On his return to England, he went to reside at the Lakes, where Wordsworth and Southey then lived; and then it was that the nickname 'Lake poets' was applied by the opposition Reviews to the trio of friends—a nickname which has long sine ceased to be a reproach. In the year in which C. went to live in Cumberland, he published his noble translation of Schiller's *Wallenstein*. Having formed a connection with the *Morning Post*, he contributed to its columns articles on politics and literature. In 1804, he was at Malta, acting as secretary to the governor, Sir Alexander Ball, an appointment he held nearly a year and a half. In 1808, he delivered lectures on Poetry and the Fine Arts at the Royal Institution, London; and the year after, he commenced the publication of *The Friend*, a serial which did not find much commercial success. By this time, C. had written, if he had not published, his finest poems; and imprudent, without resolution, or strong sense of duty, and with a taste for German metaphysics and opium gradually taking possession of him, he left his wife and family with Southey, and went to London where he resided first with Mr. Basil Montague, and afterwards, and up till the period of his death, with Mr. Gillman at Highgate.

Here the rays of his splendid genius shone more and more fitfully through clouds of German metaphysics, and his mental and moral fibre became more and more debilitated by opium. He meditated many theological and philosophical works, which were to 'reduce all knowledge into harmony,' and many epic poems which were to be the glory of literature, and never progressed so far as the first sentence of either. With the subsidence of the writing faculty, the talking faculty developed itself in C. after a fashion unknown to ancient or modern times. At Mr. Gillman's house, he held weekly *conversazioni*, discoursing on every subject human and divine for hours; and thither, from all parts of the country, ardent young men came rushing to listen to the wisdom of the sage, in 'linked sweetness' exceedingly 'long drawn out.' Towards the close of his life, his religious opinions underwent a change and he became a believer in the Trinity. All intellectual pride had ceased, and the most childlike humility had taken its place. He seemed to be conscious that the greatest powers which for generations had been granted to any Englishman had been by him miserably wasted. He died at Highgate on the 25th July 1834, in his 62d year.

As an intellectual power, C. manifested himself in a great variety of ways. Compared with his contemporaries, he did not produce a very large amount of original poetry; and of what he did produce, a considerable portion is prosaic and artificial, but the residue is of the highest order of merit. No poet ever evolved such exquisite fantasies, or wove our language into such webs of spiritual melody. He is also to this day the greatest of philosophical critics. He was the first who gave a definite reason for the 'faith that is in us' regarding Shakspeare. He was the first representative of German literature and philosophy in England, and, till Carlyle came, the most potent. His own philosophical and theological writings, although, from constitutional indolence and irresolution, in some measure incomplete, are full of incidental merits, and have given a new impulse to English thought; yet it is right to mention here, that in his philosophical writings he has been convicted of the most extraordinary plagiarism. Professor Ferrier, in *Blackwood's Magazine*, April 1840, 'tracked the footsteps of this literary reaver through the Hercynian brakes' of Schelling's metaphysics (see also Hamilton Reid's, note), and has shown page after page to be pilfered from the German author.

It has been argued, however, by way of explanation and palliation, that C., who certainly did not lack original and penetrating powers as a metaphysician, was, from the sluggishness and irresolution of his mind, better fitted to conceive in outline, and then adapt from others in detail, than to elaborate for himself a system of thought, or even the fragment of a system; while his notoriously confused and dreamy memory would be apt to mingle and confound what was his own with what *might have been* such. As a thinker, C. exerted greater influence through conversation than through books; and to him we are largely indebted for what the young men who listened to him at Highgate, Sterling, Hare, Maurice, &c., have since produced. A complete edition of his *Poetical and Dramatic Works, with Memoir*, was issued in 1877.

COLERIDGE, HARTLEY, the eldest son of Samuel Taylor Coleridge, was born at Clevedon, near Bristol, on the 19th September 1796. In 1815, C. was entered a scholar of Merton College, Oxford. At the university, he became the slave of intemperate habits, and after obtaining the Oriel Fellowship in 1818, he was judged to have forfeited it by the authorities. He then went to London, wrote for the *London Magazine*, and published therein some sonnets of remarkable beauty. He afterwards repaired to Ambleside, to receive pupils, but the scheme failed. Near this little town, so associated with genius, he resided till his death in 1849. He inherited much of his father's genius, and all his weakness of will. He wrote good verses and better prose. As a writer of verse, he is best known by his sonnets, some of which are surpassed only by those of Milton and Wordsworth. His most important prose works are the *Worthies of Yorkshire and Lancashire*, and the *Life of Massinger*.

COLEROO'N, the largest and most northerly branch from the Cauvery, flows, after a course of 93 miles, into the Bay of Bengal between Trichinopoly on the north and Tanjore on the south, separating these two districts throughout its last 80 miles. This river is remarkable for two specimens of what is called an *anakatt*, being something of the nature of a weir or dam. For many years, the bed of the C. had been observed to be gradually deepening, while that of the Cauvery, below the point of divergence, was proportionally rising, so as to constantly lessen the supplies for the irrigation of Tanjore. In 1836, however, two anakatts, an upper and a lower, were constructed, to prevent the C. from being further deepened, and to throw more water into the Cauvery —works which were soon found to act so powerfully as to require the balance of an anakatt across the Cauvery itself.

CO'LESEED. See RAPE.

COLET, JOHN, Dean of St. Paul's, was born in London in 1466, and was educated at Oxford. He traveled in France and Italy, became acquainted with Erasmus, and the friend of his own famous countrymen Grocyn, Lilly, Linacre, and Latimer. Like them he studied the Greek language with zeal, and was one of the most distinguished of the Englishmen who promoted the 'New Learning.' He did much to awaken that spirit of inquiry which led to the Reformation, especially by lectures and the expounding of Scripture in his own cathedral, and was once denounced as a heretic. He is known as the founder of St. Paul's School (1512), and author of works on grammar, *Daily Devotions*, and the *Monition to a Godly Life*. He died 16th September 1519.

CO'LEWORT, a name given to some of the many cultivated varieties of *Brassica oleracea* (see BRASSICA), and applied, like the names Borecole and Kale, to varieties differing from the CABBAGE (q. v.) in their open heads of leaves, which are used as greens, especially in the winter-months. The same name is also given to cabbages cut for use before their leaves have fully closed into heads; and the common kinds of cabbage are often planted pretty closely together, in order to be used in this way, for a supply of greens in winter and spring. C., or *collet*, is said to have been originally a name of the wild plant from which all the cultivated varieties are derived.

COLIBRI. See HUMMING-BIRD.

CO'LIC (from *colon*—see ALIMENTARY CANAL), a name employed by the later Greek and the Roman physicians to denote diseases attended with severe pain and flatulent distension of the abdomen, without diarrhœa or looseness of the bowels. The disease (commonly called *gripes* or *belly-ache*) is now generally believed to be spasmodic in character, and to be dependent upon irregular contractions of the muscular coat of the intestines: its supposed particular connection with the colon, or large intestine, however, is not usually to be made out from the symptoms. Painful disorders of the bowels are very frequent in persons who are not attentive to the regular evacuations, especially when they are exposed to cold so as to experience chill or coldness of the feet, which will often suffice to bring on an attack of colic. The disease is usually attended with constipation (q. v.), and ceases when the regular action of the bowels is restored, although often in this case the operation of medicine is attended by continued pain for a time. Warm fomentations to the abdomen may be employed with advantage, sometimes medicated with opium, or decoction of poppy-heads; and great relief is commonly experienced from friction with a warm liniment, such as opodeldoc, or the soap and opium liniment. Warmth to the feet, and the recumbent posture, are also to be recommended. In very severe or protracted cases, opium may be taken internally. A good remedy in such cases is a full dose of castor-oil (one ounce or more for an adult), with 30 or 35 drops of laudanum, or of solution of Morphia. (Opiates should not be given to children except under medical advice, and in very reduced doses.) When C. resists such mild and simple remedies as the above—when it is accompanied by tenderness of the belly, or by hard swelling in any part of it—when constipation is obstinate, or vomiting is present—when there is feverishness, or tendency to exhaustion—or when there is reason to believe that it may depend on any other cause than the mere accumulation of the products of digestion in the intestines, no time should be lost in seeking the best medical assistance that can be procured; for C. is closely allied as a symptom to several very severe and dangerous diseases. One of these complicated forms of C. is termed Ileus (Gr. *eileon*, from the idea that its seat was in the small intestine (*ileum*). It is attended with obstruction of the bowels, often from mechanical twisting or involution of one part with another (hence termed *volvulus*). This is, of course, a disease of extreme danger. The only treatment that can be attempted without medical assistance, is the employment of large injections by the lower bowel, and opium in moderate and repeated doses (¼ grain to 1 grain, or 12 to 20 drops of laudanum) by the mouth, carefully watched, and discontinued if there is any sign of narcotism. See OPIUM. C. pains are also present in Peritonitis (q. v.), another most dangerous form of disease; and they form one marked symptom of the slow poisoning by Lead (q. v.), occasionally observed as the consequence of contamination of drinking water by leaden cisterns, &c. In this form, the treatment is different from that of simple C., and will be treated of under lead-poisoning.

COLIGNY, GASPARD DE, a French admiral and general of eminence, was born at Châtillon-sur-Loing, February 16, 1517. Introduced at court, he served under Francis I. in Italy, where he evinced great bravery. Under Henry II. he was made an infantry colonel, and in 1552, admiral of France. On the death of Henry II., C., who had previously adopted the reformed faith, became, with the Prince of Condé, one of the great leaders of the Huguenots. In this capacity he was remarkable alike for his prudence and his bravery. He had the intelligence to plan, as well as the daring to execute, and above all, a heart that was not to be cast down by disasters. At the battles of Dreux and Jarnac, in the former of which Condé was taken prisoner, and in the latter killed, C.'s skill saved the remains of the Protestant army. When peace was concluded in 1570, C. went to court, and was apparently well received by the king (Charles IX.); but the enmity of the Guises, by whom C. was unjustly accused of murdering the Duke of Guise at the siege of Orleans, was stirred up against him, and an attempt was made by one of their menials to assassinate him on the street, August 22, 1572. This attempt at individual murder was but a preliminary to the general massacre of Huguenots which took place two days afterwards, and in which C. was basely slaughtered, his body being afterwards exposed to the vile outrages of the mob.

COLI'MA, a name of various application in Mexico.—1. A volcano of the Cordilleras, with an elevation of about 12,000 feet, in lat. 20° N., and not far from the western coast of the republic. —2. A territory of the Confederation, with (1868) 63,333 inhabitants, extending about 100 miles along the coast; area about 3400 square miles.—3. The capital of the territory, comprising nearly the half of its population, stands in a fertile plain to the south-west side of the volcano.—4. A seaport on the Pacific, about 40 miles to the south-west of the capital.

CO'LIN. See VIRGINIAN QUAIL.

COLL, one of the Western Isles of Scotland, off the west coast of Mull, and forming part of Argyleshire, and 2½ miles north-east of Tiree Isle. It is 14 miles long from north-east to south-west, with an average breadth of 2½ miles. More than a third of it is cultivated, or in pasture. The isle is low and rocky, and is composed of gneiss, approaching to granite and hornblende slate. Pop. (1871) 723; (1881) 643, engaged in agriculture and fishing.

CO'LLAR-BEAM, STRAI'NING-BEAM, &c., the horizontal tie connecting a pair of rafters. Large roofs have two or more collar-beams.

CO'LLARING, the cylindrical part of the capital in the Doric and Tuscan orders. It is often termed the neck.

COLLA'TERAL (Lat. *collarteralis*). See CONSANGUINITY, SUCCESSION.

COLLATERAL SECURITY, is an additional and separate security for the performance of an obligation, or the implement of a bond or covenant.

COLLA'TION, in the Law of England, is where a portion advanced by the father to a son or daughter is brought into *hotch-pot* (q. v.) in order that the beneficiary may have an equal share of his personal estate at his death. C. in this sense corresponds to the C. amongst younger children in Scotland. But in that country there is also the C. between the heir and executor. If the heir accept the heritable (real) estate of the deceased, however small it may be, he has no claim to share in the executry or movable (personal) succession; but should he consider it for his interest, he may claim the share of the movable estate which falls to him as next of kin, on condition of his ceasing to be heir by collating the heritage with the executors. The privilege is not confined to a son, but extends also to brothers and other collaterals.

COLLATION TO A BENEFICE is the act of bestowing a benefice by the bishop or other ordinary, where he has right of patronage. When a bishop *confers*, or collates to a benefice, presentation and institution are both comprised in the act of collation.

CO'LLÉ, a town of Italy, situated on the Elsa, about 22 miles south-south-west of Florence. A steep ridge separates the town into two portions, the lower of which is chiefly occupied by manufactories. C. has a cathedral and castle, and its paper manufacture is extensive. Wine, olive-oil, and silk are produced in the environs. Pop. 5000.

CO'LLECT, a name of uncertain origin, given to certain short prayers in different church-liturgies. It is from the Latin *colligere*, as some ritualists think, because of the comprehensive brevity of such prayers, the matter of the epistle and gospel, e. g., being gathered up, or *collected*, into the C. for the day, as appears in the English Common Prayer Book. Others, with more probability, ascribe to the name an origin from an ancient practice of the chief minister collecting into a single brief prayer at the end of the service the previous devotions of the people; accordingly, one of the service books of the ancient Catholic Church was called *Collectarium*, as containing such prayers. Of the collects used in the liturgy of the Church of England, some are taken from the old Roman Missal, and were probably the composition of St. Jerome; others are of more ancient and primitive times, and a few were composed at the Reformation. They begin with commemorating some attribute of God, or pleading some infirmity or necessity of man, and end with a simple petition based thereupon. Hence it will be seen that the practical teaching of a church may to a great extent be seen in its collects. For every Sunday, there is a proper C., with corresponding epistle and gospel; and this C. stands for every day in the following week, except in the case of festivals and their eves or vigils, which have collects of their own.

COLLECTIONS AT CHURCHES. The collections which are still made at all churches in Scotland—either at the church-doors before the service, or in the church after it—were, till a comparatively recent period, the principal fund for the support of the poor. By a proclamation of the Privy Council of 29th August 1693, it was ordered that one-half of the sums so collected, and of dues received by the kirk-sessions, be paid over to the general fund for the support of the poor. The other half has generally been applied for the relief of sudden or temporary distress. By the Poor-law Act (8 and 9 Vict. c. 83), it is enacted (s. 54) that in all parishes in which it has been agreed that an assessment shall be levied for the relief of the poor, all moneys arising from the ordinary church collections shall in future belong to, and be at the disposal of, the kirk-session; provided, however, that they shall be applied to no purposes other than those to which they were, in whole or in part, legally applicable before the date of the act. A power is reserved to the heritors to examine the accounts of the kirk-session, and to inquire into the manner in which the collections are applied; and the session-clerk is enjoined to report annually as to the application of the moneys, to the Board of Supervision.

The collections made at dissenting meeting-houses, under which denomination Episcopal chapels are included, are entirely at the disposal of the congregations.

In England, there are no regular C. at churches as in Scotland. The alms collected in chapels, as well as in parish-churches, during the reading of the offertory, are declared by the rubic to be at the disposal of the incumbent and churchwardens of the parish, and not of the minister or proprietor of the chapel. If the minister and churchwardens disagree as to the distribution of the alms, they shall be disposed of as the ordinary shall appoint. See OFFERTORY.

CO'LLEGE (Lat. *collegium*, a collection or assemblage). In its Roman signification, a C. signified any association of persons for a specific purpose. In many respects it was synonymous with *corpus*, a body or collection of members, a corporation—with *universitas*, a whole as contrasted with its parts—and with *societas*, a company or partnership, as opposed to all the members of which it was composed. A Roman C. had a common chest, and it could sue and be sued in the name of its manager (actor or syndicus), just like an incorporation with us. It required also to be incorporated by some sort of public authority, springing either from the senate or the emperor. A C. could not consist of fewer than three persons, according to the well-known maxim, 'three make a college' (Dig. 50, tit. 16, l. 85). Some of these colleges were for purely mercantile purposes, but there were others which had religious objects in view, such as the *Collegia Pontificum, Augurum*, &c., and which thus made a sort of approach to a C. in the modern sense. With us, a C. is an incorporation, company, or society of persons, joined together generally for literary or scientific purposes, and frequently possessing peculiar or exclusive privileges. See PHYSICIANS, COLLEGE OF; SURGEONS, COLLEGE OF. Very often in England a C. is an endowed institution connected with a university, having for its object the promotion of learning.

In this relation, a C. is a subcorporation, i. e. a member of the body known as the University. The constitution of a C. in this, its most general and proper sense, depends wholly on the will of the founder, and on the regulations which may be imposed by the visitor (q. v.) whom he has appointed. For a more detailed account of C. in this sense, see UNIVERSITY, OXFORD, CAMBRIDGE, PARIS, EDINBURGH, &c. In Scotland and in America, the distinction between the C. as the member, and the university as the body, has been lost sight of; and we consequently hear of the one and the other indiscriminately granting degrees, a function which in the English and in the original European view of the matter belonged exclusively to the university. Where there is but one C. in a university, as is the case in all universities of Scotland, the two bodies are of course identical, though the functions which they perform are different. In Germany, there are no colleges in the English sense; and though the universities in that country perform precisely the same functions as in Scotland, the verbal confusion between the C. and the university is avoided by the latter performing the functions of both in its own name, as two separate parts of its proper duties. In France, C. has a meaning totally different from that which we attach to it: it is a school, corresponding, however, more to the gymnasium (q. v) of Germany than to the grammar-school of this country. All the colleges are placed under the university of France, to which the centralizing tendencies of that country have given a meaning which also differs widely from that which the term University bears in England. See UNIVERSITY OF FRANCE.

COLLEGE DE FRANCE, originally a *Collége de Trois Langues* merely, founded by Francis I. in 1530, is now a very important educational institution giving instruction over a very wide field of literature, history and science. It is independent of the University of France (q. v.), is directly under the Minister of Public Instruction, and is supported by the government. As in the Sorbonne (q. v.), the lectures are gratuitous; and for the most part are designed to attract authors older than ordinary university students. The college comprises two faculties, one literary, one scientific; and each has about 20 professors. Amongst the professors are some of the most distinguished scholars and scientists in France, such as M. Renan, M. Laboulaye, M. Gaston de Paris, in the literary department; and M. Broun-Séquard in the science division. Amongst the subjects discussed are political economy, Assyrian and Egyptian archæology, Arabic, Slavonic literature, French literature; physiology, anatomy, and embryology.

COLLEGE OF ARMS. See HERALDS' COLLEGE.

COLLEGE OF JUSTICE, in Scotland, which was formed on the model of the Parliament of Paris (q. v.), consists of the supreme civil court (see COURT OF SESSION), with all its members and officers. The title occurs in the statute 1537, c. 36; and in 1540, c. 93, the judges are styled senators. The present members of the C. of J. are, in addition to the judges, advocates (Anglicè, barristers), clerks of session, clerks of the bills, &c.; writers to the signet, solicitors before the supreme courts (not solicitors at law), deputy-clerks and their substitutes, &c.; clerks of Exchequer, directors of Chancery, and their depute and clerks, the writer to the privy seal and his depute, clerks to the general registers of sasines and hornings, macers of the Court of Session, the keeper of the minute-book, the keeper of the rolls of the Inner and Outer House, one clerk to each judge, one clerk to each advocate, the extractors in the Register House, and the keeper of the Advocates' Library. In addition to the above, the keeper of the judicial records, the assistants to the principal clerks of session the auditor of the Court of Session, and the collector of the fee fund, are members *ex officio* by 1 and 2 Geo. IV.

COLLEGIGATE CHURCHES—so called from having a college or chapter, consisting of a dean and canons, attached to them—differ from cathedrals in that the see of the bishop is at the latter. The service is or should be the same in both. They are under the jurisdiction of the bishop of the diocese in which they are situated, and he exercises visitorial powers over them. Those remaining in England are Westminster, Windsor, Wolverhampton, Heytesbury, Southwell, Middleham; also Brecon in Wales, and Galway

in Ireland. Ripon and Manchester have been constituted the cathedrals of the new dioceses. Some churches called collegiate (as Beverley) have no chapters.

CO'LLIER, JEREMY, a celebrated nonjuring clergyman, was born in Cambridgeshire on the 23d September 1650. He went to Cambridge in 1669, and took his degree of M.A. in 1676. At the revolution of 1688, he first plunged into the stormy waters of controversy, his foeman being Burnet, afterwards Bishop of Salisbury. For a publication of his at this time, entitled *The Desertion Discussed*, which gave offence to the government of William, he was sent to Newgate, where he remained several months. On his release he rushed anew into the wars of party, and distinguished himself therein by the publication of several controversial works. Suspected of being a partizan of the Stuarts, he was again arrested in 1692, and imprisoned for a short time in the King's Bench. From this period, his life was a scene of perpetual literary strife, government being the principal object of his attack. He died in London, 26th April 1726. C. wrote many books, including the *Ecclesiastical History of Great Britain;* but the work by which he is best known, is his *Short View of the Immorality and Profaneness of the English Stage*, published in 1698. Congreve and Farquhar came to the rescue of their craft, to the great delight of C., who was never happier than when wielding the satirical whip, and who had no objection to encounter a couple of opponents at a time.

The combat lasted for ten years, and at the close, C. remained master of the field. His strictures on the stage were needed at the time, and his writings materially aided its subsequent purification.

COLLIER, J. PAYNE, a well-known Shakspearian critic and commentator, was born in London in 1789. He became a parliamentary reporter on the staff of the *Morning Chronicle*, and afterwards edited the *Evening Chronicle*. It was in the pages of the former that his first essays in the field of Elizabethan literature appeared. In 1820, he published *The Poetical Decameron;* from 1825 to 1827, a new edition of Dodsley's *Old Plays;* and in 1831, his best work, a *History of English Dramatic Poetry to the Time of Shakspeare, and Annals of the Stage to the Restoration.* This opened up to him two influential sources of information, the libraries of Lord Francis Egerton and the Duke of Devonshire, the latter appointing him his librarian. His next work was a *Bibliographical and Critical Catalogue.* From 1835 to 1839, he published *New Facts regarding the Life and Works of Shakspeare;* followed by an edition of Shakspeare. His next work was the famous volume, *Notes and Emendations to the Text of Shakspeare's Plays, from early manuscript Corrections in a Copy of the Folio of* 1632, *in the Possession of J. P. Collier.* This publication excited great commotion in the literary world; opinion was divided, and the *Emendations* were furiously applauded or furiously assailed. It was in time generally admitted that many of them were just corrections of typographical errors; that many, in cases where the author's meaning was doubtful, displayed very remarkable ingenuity; but that others darkened texts which, save to a commentator, were transparent enough. Later, it was even alleged by some that C. had himself written the marginal emendations in a feigned hand. In 1865 appeared his *Bibliographical Account of Rare Books.* In 1866 he commenced a series of reprints of our early poets and phampleteers. His later works include his *Book of Roxburghe Ballads, Shakspeare's Library, Extracts from the Registers of the Stationers Company, Memoirs of Actors of Plays of Shakspeare*, and *Autobiographical Recollections.* He died at Maidenhead, September 17, 1883.

COLLI'N, or KOLI'N, a town of Bohemia, on the left bank of the Elbe, about 39 miles east-south-east of Prague. It has manufactures of sugar, manure, and oil. Pop. 11,332. In the vicinity was fought, in 1757, the famous battle in which Frederick the Great was defeated by the allied Austrian and Saxon armies under Marshal Daun.

CO'LLINE is a term applied to common gelatine, or Glue (q. v.).

CO'LLINGWOOD, CUTHBERT, ADMIRAL LORD, was born at Newcastle-upon-Tyne, 26th September 1750. Sent to sea as a midshipman at the age of eleven, his life thenceforth, with the exception of some half-dozen years, was spent wholly on board ship. He was an intimate friend of Nelson, whom he followed up the ladder of promotion step by step, until Nelson's death left the topmast round vacant for himself. Among the great naval victories in which C. bore a prominent part, were those of Lord Howe off Brest in June 1794; of Lord Jervis off Cape St. Vincent in 1797; and of Trafalgar in 1805, where he held the second command. In the last-named engagement, his ship was the first to break through the line of the combined French and Spanish fleets; and after Nelson had received his death-wound, he assumed the chief direction, and completed gloriously the triumph which had been so daringly commenced. A peerage was his reward for his gallant conduct in this battle. After several years' able service in the Mediterranean, C. died at sea, March 7, 1810. He was a thorough seaman, unsurpassed by any officer in the navy, at once brave and cool, firm and mild in command.

COLLINGWOOD, a town of Ontario, Canada, on the south shore of the branch of Lake Huron, called Georgian Bay. C. is an important railway terminus, connecting the railways with the lake steamers. Pop. (1871) 2829; (1881) about 5000.

COLLINS, ANTHONY, an able free-thinking writer on religious questions, was born in 1676, at Heston, near Hounslow, in Middlesex. He studied at Eton, and afterwards at King's College, Cambridge. In 1707, he published his *Essay concerning the Use of Human Reason;* and in 1709, his *Priestcraft in Perfection*, &c., which fluttered the churchmen of that time exceedingly. The controversy excited by this last work induced C. to write his *Historical and Critical Essay on the Thirty-nine Articles.* His next work was a *Vindication of the Divine Attributes*, in reply to the Archbishop of Dublin, who asserted the compatibility of Divine Predestination and Human Freedom. C. was a philosophical Necessitarian, and afterwards advocated his opinions more fully in his *Philosophical Inquiry concerning Liberty and Necessity* (1715). In 1711, he went to Holland, where he made the friendship of LeClerc and other eminent *literati.* On his return to England, he published his *Discourse on Free-thinking*, the best known, and the most important of all his works. In 1718, he was made treasurer for the county of Essex; and in 1724 appeared his *Grounds and Reasons of the Christian Religion*, which gave occasion to no less than thirty-five replies. Two years later, he defended himself in his *Scheme of Literal Prophecy;* and in 1727, published his last work, a reply to Dr. Rogers's *Eight Sermons on the Necessity of Revelation and the Truth of Christianity.* C. died December 1729. He was a friend and correspondent of Locke, who declared that 'C. had as much love of the truth for the truth's sake, as ever he had met with in anybody.' His character for integrity and benevolence stood very high.

COLLINS, WILLIAM, a poet of considerable merit and reputation, was born December 25, 1721, at Chichester, where his father was a hatter. He received his education at Winchester College and Oxford. In 1742, he published a small volume containing the *Oriental Eclogues*, and the *Epistle to Sir Thomas Hanmer.* These are not so characteristic of his genius as his later writings. Although the publication was not attended with success, he resolved upon a literary career, and with this object went to London in 1744. Here, from time to time, he published other poems, chiefly consisting of odes; but misfortunes, occasioned chiefly by his own indolence and irresolution, finally rendered him a prey to melancholy, which at times deepened into insanity. This has imparted an interest to his memory which his works alone might not have been able to excite. He died at Chichester in 1756. The poems which he has left are comparatively few; but they entitle him to no mean rank among the poets of the 18th century. He was essentially a lyrical poet; and it is upon his odes that his reputation is principally founded. All his best qualities are exhibited in the well-known ode on *The Passions*—a poem which, at the time it was written, was undoubtedly one of the finest odes in the language. The personification of the passions is true and striking, and the variation of the measure is well adapted to the various emotions to be expressed. Among his other pieces may be mentioned the odes *To Liberty, To Mercy, To Evening, Ode written in* 1746, and the first part of the ode *To Fear.*

COLLINS, WILLIAM, R.A., a distinguished English artist, was born in Great Tichfield Street, London, September 18, 1787. C. early displayed a decided taste for art. In 1807 he entered the Royal Academy as a student, and in the same year he exhibited two pictures at the Academy's exhibition. At first, necessity obliged him to devote himself to portraits, but money coming in rapidly, he was soon able to give his genius its bent; and his children swinging on gates, his children gazing in delighted wonderment on the newly discovered nest, his coast-scenes, his groups of prawn-fishers, his shrimpers on the ebbed sea-beach, drew admiring eyes as they hung on the Academy walls, and brought remunerative prices. C. was elected R.A. in 1820. In 1836 he visited Italy, and remained there nearly two years, studying the great masters, and sketching monks and peasants, and groups of bronzed children. In 1839 he sent to the Academy several Italian pictures, which were greatly admired. His attempts in another direction 'Our Saviour with the Doctors in the Temple' (exhibited in 1840), and 'The Two Disciples at Emmaus' (1841)—were not particularly successful, and he wisely fell back on his green fields, his sea-beaches, his rustics, and his children at their games. His death took place in London on the 17th February 1847.

COLLINS, WILLIAM WILKIE, son of the preceding, was born in 1825, and was educated for the bar. He is widely known as a novelist and miscellaneous writer. He is a great master of mystery, and can so hide a secret in a wrappage of circumstance, that, before it is discovered, the whole tissue must be unrolled. Sev-

eral of his works are models of construction; and in working out his plots, he diverges neither to left nor right, indulging neither in irrelevant pathos nor description. His principal works are *Antonina, Basil, Hide and Seek, After Dark, The Dead Secret*, and *The Woman in White* (1860), *No Name, My Miscellanies, Armadale, The Moonstone, Man and Wife* (1870), *The New Magdalen* (1873), *The Law and the Lady* (1875), *A Rogue's Life* (1879), *Jezebel's Daughter* (1880), and *Black Robe* (1881).

COLLISIONS OF VESSELS. To prevent vessels running against one another in passing, there is a 'Rule of the road' (q. v.) at sea as well as on land. The Trinity House lays down regulations which, though not having the force of law, are recognized by the Admiralty, and govern the decisions in cases of collision. It is at night that the danger of collision is greatest; and hence the necessity for a well-arranged system of lights and other precautions. Of 3575 casualties of all kinds on and near the coasts of the United Kingdom in 1880—1881, 713 were due to collisions; of these, 69 resulted in total loss. The average of the results of collisons for the 10 years 1865—1875 gives: total loss, $81\frac{2}{5}$; partial damage, $345\frac{3}{10}$.

COLLO'DION (Gr. *kollao*, to stick). This substance, on its first introduction, employed in surgery as a preservative of wounds, &c., from contact of air, by means of the tenacious and transparent film which it leaves on evaporation—and now, also, in a slightly modified form, remarkable as the basis of a highly sensitive process for taking pictures by the agency of light—may be defined as a solution of *Pyroxyline* in a mixture of alcohol and ether, to which is added for photographic operations, a small quantity of some souble iodide, bromide, or chloride.

The first step in making C. is the preparation of pyroxyline: Take 10 fluid ounces of sulphuric acid, specific gravity 1·84, in a dish; add 12 fluid drachms of water, and 10 fluid ounces of nitric acid, specific gravity 1·45; and raise the temperature to 140° by immersing the dish in boiling water. One ounce of pure linen or paper should now be immersed in small pieces at a time, keeping the mixture in motion until the liquid is nearly absorbed by the linen or paper.

The action having continued for about ten minutes, the contents of the dish should be plunged into a vessel containing a large quantity of water, which should be speedily poured off and repeatedly changed, until the linen or paper is so thoroughly washed as not to give the slighest indication of acid to the most delicate test-paper, after which it should be slowly dried at a low temperature, and preserved in a glass bottle for use..

One hundred and four grains of the pyroxyline thus prepared are dissolved in a mixture of 16 oz. of pure sulphuric ether, and 2 oz. alcohol, specific gravity ·840; and to this mixture are added 48 grains iodide of cadmium, 30 grains iodide of potassium, and 25 grains bromide of cadmium, dissolved in 4 oz. of alcohol, of specific gravity ·840 C. thus prepared should, after becoming clear by subsidation, yield a rich creamy film of iodide and bromide of silver on immersion in the nitrate bath.

The foregoing formula yields a C. very suitable for taking what are termed *negative* impressions in the camera; but when it is desired to take *positive* pictures, cotton wool should be substituted for linen or paper in the preparation of the pyroxyline, and the iodizing solution should contain iodide of ammonium instead of iodide of potassium. It is important also that the alcohol employed should be free from organic impurities in the shape of fusel and grain oils, small traces of which mar the purity of the high lights in a positive, though their presence is comparatively harmless in a negative photograph. For surgical purposes a *flexible* C. is used, composed of C., combined with certain proportions of Canada balsam and castor-oil. See also CELLULOID and GUN COTTON.

COLLODIONIZED PAPER PROCESS. Paper being substituted for glass in this process, as a basis upon which to support the film, a great increase in portability is arrived at, as the sensitive sheets may be carried in a portfolio, and employed in the same manner as dry collodion plates. There are difficulties, however, in the way of its successful practice, which have prevented it from becoming as popular as it deserves to be. The following is a brief summary of the manipulations. Mr. Corbin, the inventor of the process, ascertained that a peculiar collodion was requisite, the formula of which is as follows: ether, 650 parts; alcohol, 350 parts; pyroxyline, 15 parts; iodine, 1¼ part. The collodion so prepared is poured on the glass in the usual way, and sensitized in a bath containing only one per cent. of nitrate silver, and a half per cent. of nitric acid. The plate having remained in this bath about two minutes, is withdrawn, and freely washed with water; it is then immersed in a solution of one per cent. of iodide of potassium, to insure the complete decomposition of the whole of the free nitrate of silver not removed by the washing. A piece of negative paper is now coated with a solution of gelatine, containing 6 parts of gelatine to 100 parts water; the dimensions of the paper should be rather less than the glass, and the gelatinized side is brought into contact with the collodion film in a dish of water, any intervening water being expelled by passing a glass rod lightly over it. The edges of the collodion film which project beyond the paper are folded back on it, and the film and paper removed together.

The now collodionized paper is laid, film uppermost, on a glass plate, coated with a preservative solution, composed of equal parts of albumen and honey, diluted sufficiently to enable it to flow freely over the paper. The film is lastly sensitized in a solution of nitrate of silver, 5 parts; glacial acetic acid, 5 parts; water, 100 parts; it is then freely washed as before in water, and hung up to dry. As it is apt to wrinkle in drying, it should be attached by all four corners to two lines, running one under the other.

COLLOID is a name applied by Graham to a yellowish, transparent, viscid matter of gelatinous appearance. Starch, gum, albumen, and gelatine are examples of colloids; and the name is used in contradistinction to *crystalloids*.

COLLOT D'HERBOIS, JEAN MARIE, one of those men who gained an infamous notoriety in connection with the first French Revolution, was born in Paris in 1750. Originally a provincial actor, the revolutionary movement attracted him to Paris, where his impudence, his loud voice, and his *Almanach du Père Gérard*, which obtained the prize of the Jacobin Club, secured for him public recognition, and he was elected to the National Convention as one of the deputies for Paris. His general ferocity marked him out as a fit person for the presidency of the Convention, to which he was appointed June 13, 1793, and as a member of the murderous Committee of Public Safety. Sent by Robespierre to Lyon in November 1793, C. took bloody revenge on the inhabitants for having once hissed him off the stage in the theater. Not less than 1600 persons were destroyed by the guillotine and by discharges of grape-shot. An attempt made to assassinate C. (May 23, 1794) served only to increase his popularity, and thus excited the envy of Robespierre, who determined to destroy so formidable a rival. C. therefore took a prominent part in the overthrow of Robespierre and his party in July 1794, but the reaction following this event proved fatal to himself. C. was expelled from the Convention, and in March 1795 was sentenced to deportation to Cayenne, where he caught a fever, and died in great agony, January 8, 1796. Besides revolutionary pamphlets, C. wrote a great number of dramas, now utterly forgotten.

COLLU'SION, an agreement between two or more persons to defraud. The law abhors C., and consequently it has the effect of voiding every transaction which is founded upon it. Arrangements between bankrupts and creditors whom they wish to favor, on the eve of bankruptcy, are amongst the most frequent instances of C., and one of the leading objects of all systems of bankrupt law has been to defeat them. In England, C. is spoken of as 'a deceitful agreement or contract between two or more persons, for the one to bring an action against the other, to some evil purpose, as to defraud a third person of his right.'—*Tomlin's Dictionary*. But there is no limit to the circumstances in which the occurrence of C. is conceivable in any country.

CO'LMAN, GEORGE, commonly called 'the Elder,' a dramatic author and theatrical manager of last century, was born at Florence about 1733. In 1760, his first dramatic piece, entitled *Polly Honeycomb*, was produced at Drury Lane with great success. Next year, he gave to the world his comedy of *The Jealous Wife*, and in conjunction with Mr. Garrick, he in 1766 wrote *The Clandestine Marriage*. In 1761, he became one of the purchasers of Covent Garden Theater, and held the office of acting manager for seven years, after which period he sold his share. In 1777, he purchased the theater in the Haymarket from Mr. Foote. In 1785, he was attacked by palsy, and never recovered; he died August 14, 1794. C. was an industrious author; besides poetry and translations, he wrote and adapted upwards of thirty dramatic pieces.

COLMAN, GEORGE, 'the Younger,' son of the preceding, was born October 21, 1762. His bent lay in the same direction as his father's, during whose illness he acted as manager of the Haymarket Theater; and on the death of the elder Colman, George III. transferred the patent to his son. C. held, for a considerable time, the office of examiner of plays. In industry, he rivalled his father, and he received large sums for his dramatic writings, some of which continue in possession of the stage. He was twice married, and died on the 26th October 1826. His last literary work was *Memoirs*, published in two volumes.

COLMAR, a city ceded to France in 1697, and repossessed by Germany since 1870, the capital of Upper Alsace, stands on a plain near the Voges, 41 miles N.N.E. of Strasburg. A stream of water from the Lauch and Fecht, at the confluence of which the town stands, flows through and keeps the streets clean. Among the principal buildings of C. are the cathedral, the Dominican church, the college, court-house, and town-house. C. is a busy place—one of the chief seats of the cotton manufacture in Alsace. Water, being abundant, is the principal motive-power in driving

the machinery, but steam is also employed to a considerable extent. Other manufactures are paper, leather, ribbons, and hosiery. C. is an old place, having been raised to the rank of a city in 1220. About the end of that century, it was made a free town, and rapidly became one of the most prosperous in Upper Alsace. Fortified in 1552, its fortifications were razed in 1673 by Louis XIV. Pleasant boulevards now occupy their place. Pop. (1875) 23,778.

COLNE, a town in the east of Lancashire, on a high ridge near the source of the Calder, a western branch of the Ribble, 32 miles north-east of Manchester, at the junction of the Lancashire and Yorkshire and Midland Railways. It has manufactures of cotton calicoes, and mousselines-de-laine. Coal, slate, and lime abound in the vicinity. Pop. (1871) 7335. C. is an ancient place, by some supposed to be the *Colunio* of the Romans Many Roman coins have been found here. As early as the beginning of the 14th c., it was the seat of woollen manufactures.

CO'LOCYNTH (Gr. *kolokynthis*), a well-known medicine, much used as a purgative, is the dried and powdered pulp of the *Colocynth Gourd, Coloquintida, Bitter Apple,* or *Bitter Cucumber,* a globose fruit about the size of an orange, of a uniform yellow color, with a smooth, thin, solid rind. The plant which produces it, *Cucumis* (or *Citrullus*) *Colocynthis*, is nearly allied to the Cucumber (q. v.). It is common in Asia, Africa, and Spain, which last country supplies no small part of the C. of commerce. The fruit is gathered when it begins to turn yellow, peeled, and dried quickly either in a stove or in the sun. It is chiefly in the form of a dried extract that it is used in medicine. It owes its properties to a bitter principle called *Colocynthine,* which is more or less abundantly present in the fruits of many of the gourd-family. It is a curious fact, but to which there are many analogous, that the seeds of the C. plant produced in the midst of its medicinal pulp, are perfectly bland, and they even form an important article of food in the north of Africa.—The name False C. is sometimes given to the Orange Gourd (*Cucurbita aurantia*), sometimes cultivated as an ornamental plant in our gardens, on account of its globose, deep-orange fruit. The pulp of the fruit possesses the properties of C., but in a milder degree.

C. is generally administered in the form of pills, in which the extract is associated with aloes, scanmony, and in some cases with calomel or with extract of hyoscyamus. In small doses, the C. acts as a safe and useful purgative; and when accompanied by hyoscyamus, the latter prevents much of the pain and griping which are attendant on the use of C. by itself. In large doses, C. is a poison.

COLO'CZA, or KALOCSA, a town of Hungary, situated on the left bank of the Danube, 68 miles south of Pesth. It has an archiepiscopal palace or castle, and a cathedral. Pop. (1880) 15,789, who are chiefly engaged in the fisheries on the Danube, and in the breeding of cattle. There is a steam packet station at Colocza.

COLO'GNE (Ger. *Köln;* the *Colonia Agrippina* of the Romans), a city and free port on the left bank of the Rhine, in lat. 50° 56′ N., long. 6° 58′ E. Formerly an independent city of the German empire, it is now the capital of Rhenish Prussia. C. is a fortress of the first rank, forming a semi-circle, with the Rhine as its chord, and the town of Deutz on the opposite bank as a tête-du-pont. It is connected with this suburb by a bridge of boats, and a a fine iron bridge 1362 feet in length, for railway and carriage traffic. Pop. (1871) 129,233, only 16,746 of whom were Protestants; (1880) 144,751. The streets are mostly narrow and crooked. The public buildings are numerous, including a number of educational and of charitable institutions. The church of St. Ursula is noted as the place where are preserved the bones of 11,000 virgins companions of St. Ursula (q. v.), who, according to the legend, were slaughtered at C. by the Huns, because they refused to break their vows of chastity. In the 'golden chamber' are the coffin of the saint, and the skulls of a few of her most favored maidens encased in silver. The church of St. Gereon, the first portion of which was founded in 1066, boasts of the possession of the bones of St. Gereon, and of the 6000 Theban martyrs slain during Diocletian's persecution. The church of St. Peter is celebrated for the altar-piece of the crucifixion of St. Peter by Rubens, and that of the Minorites for containing the tomb of the famous scholastic, Duns Scotus. The chief object of interest in the city, however, as well as its greatest ornament, is the cathedral, one of the noblest specimens of Gothic architecture in Europe.

This cathedral is said to have had its origin in an erection by Archbishop Hildebold, during the reign of Charlemagne in 814. Frederic the Red-bearded bestowed upon it, in 1162, the bones of the three holy kings, which he took from Milan, and this gift contributed greatly to the increase of its importance. The bones are retained as precious relics to this day; but the old structure was burned in 1248; according to some accounts, the present cathedral was begun in the same year, but others fix the date of its commencement in 1270—1275. To whom the design of this noble building is to be ascribed, is uncertain. The choir, the first part completed, was consecrated in 1322. The work was carried on, sometimes more actively, sometimes more slowly, till the era of the Reformation, when it was suspended; and during the subsequent centuries, not only was nothing done to advance it, but what had been already executed, was not properly kept in repair. In the beginning of the present century, however, attention was directed to its unrivalled beauties, and it has since become the subject of an enthusiasm extending over all Germany, and which has given birth to a multitude of associations for the supply of the necessary funds to repair and complete it according to the original design. Funds have also been forthcoming from other parts of Europe. On September 4, 1842, the king of Prussia, who had contributed largely to the funds, laid the foundation-stone of the transept, since which time great progress has been made. The naves, aisles, and transepts were opened in 1848. The magnificent south portal was completed in 1859, and the north has also been finished; and in 1860, the iron central spire was added. With the exception of the towers, the church was completed in 1863; and the towers, the crown of the edifice, were finished in August 1880. The body of the church measures 500 feet in length, and 230 feet in breadth; the towers are above 500 feet high. Since 1823, £900,000 has been expended on the building; the total cost of the whole is estimated at £2,000,000. The situation of the city is extremely favorable for commerce. Various branches of manufacture are carried on, of which the chief are the making of beet-sugar, tobacco, glue, carpets, soap, leather, furniture, pianos, chemicals, and spirits of wine, besides the characteristic manufacture of Eau-de-Cologne (q. v.). In 1876, 6670 vessels and boats traded at the quays of C. C. has extensive and important railway connections.—The city was founded by the Ubii, about 37 B.C., and was at first called *Ubiorum oppidum;* but a colony being planted here in 50 A.D. by Agrippina, the wife of the Emperor Claudius, it received the name of *Colonia Agrippina.* At the partition of the Frank monarchy in 511, it was included in Austrasia; and by a treaty in 870, was united to the German Empire. It entered the league of the Hanse towns in the beginning of the 13th c., and contended with Lübeck for the first rank. It was at a very early period the seat of a bishopric, which was elevated, in the end of the 8th c., into an archbishopric, and the archbishops acquired considerable territories, some of them distinguishing themselves as politicians and warriors.

They took their place amongst the princes and electors of the empire, but were involved in a protracted contest with the citizens of C., who asserted against them the independence of the city, and the archiepiscopal residence and therefore removed to Bonn. The archbishopric was secularized in 1801, when the city also lost its independence, and the congress of Vienna did not attempt to restore to it its former character, but assigned the whole territories to Prussia. The archbishop, therefore, has not now the political rights and power that belonged to his predecessors.

COLOGNE YELLOW is a pigment composed of 2 parts of yellow chromate of lead, 1 of sulphate of lead, and 7 of sulphate of lime or gypsum.

COLOMBA'NO, SAN, a town of North Italy, in the province of Milan, on the right bank of the Lambro, about 10 miles south of Lodi. It is situated in the midst of hills, in which are found porphyry, feldspar, and fine red granite, and also limestone containing numerous fossils. Pop. 6000.

COLO'MBIA, immediately after the war of independence, was a term which embraced all that now belongs to the three republics of Venezuela, United States of Colombia, and Ecuador, being the entire north of South America, and the extreme south of what is geographically distinguished as Central America. Independently of the singular difficulties of communication, and of the resulting absence of anything like natural unity, this unwieldy state contained, from the beginning, the cause of its own dissolution in the national character of its inhabitants. So long as union was necessary to meet external dangers, C. maintained an imposing attitude in the eyes of the world; but, gradually, sectional interests and political jealousies did their work, and, at last, about 1830, the ill-assorted elements of the confederation were separated for ever.

COLOMBIA, UNITED STATES OF, the official title, since 1861, of what was formerly called NEW GRANADA (q. v.).

COLO'MBO, the capital of Ceylon, an episcopal city and seat of government, is situated on the western side of the island 6° 59′ N. lat., and 80° 4′ E. long., near a rocky headland, the *Jovis Extremum* of Ptolemy, by which the mariners of antiquity steered for the port of Galle. The modern fortifications of C. which were constructed by the Dutch, include, on the land-side, four bastions with counterscarps and ravelins, and, towards the sea, seven batteries. Except the military officers, few Europeans resided within the fort. Colpetty, a beautiful suburb, shaded by groves of the cocoa-nut palm, is a favorite retreat. Here, the houses are chiefly of one

story, with broad verandahs. The large and lofty rooms are furnished with punkahs, floored with tiles, and for the sake of air, have windows opening to the ground, at which, however, snakes, lizards, scorpions, and the teeming insects, of a tropical country, make free to enter. The humble mud-constructed dwellings of the Dutch, Portuguese, Eurasians, Singhalese, Tamils, Moors, and Malays are outside the city walls. The *pettah* or Black Town, the only ancient quarter, extends to the river Kalany-ganga. Pop. (1871) 100,238. C. is connected with Kandy by railway.

The mean annual average of temperature at C. is 80°, or thereabout, and has reached to 86° in extraordinary years. The annual fall of rain is 72·4 inches, of which the greatest quantity is measured at the change of the monsoon, when it pours down in a perfect deluge. Out of 72·4 inches, 20·7 fall in April and May, and 21·9 in October and November.

The early name of C., Kalan-totta, the 'Kalany Ferry,' so called from its proximity to the river, the Moors corrupted into Kalambu, and by this designation it was described about 1340 A.D. as the finest city of Serenbid. At the arrival of the Portuguese, who fortified it 1517 A.D., Kalambu had merged into Kolamba or Columbu, which they henceforth wrote Colombo, in honor of Christopher Columbus. The Dutch succeeded to the Portuguese (see CEYLON), and C. was taken by the British, 16th February 1796.—Sir James Emerson Tennent's *Ceylon*.

CO'LON. See PUNCTUATION.

COLON, that portion of the large intestine which extends from the Cæcum (q. v.) to the rectum, which is the terminal portion of the intestinal canal. Whether it is derived from *koilon*, 'hollow,' or *kolao*, 'I arrest' (because the fæces are retained for a considerable time in it), is uncertain. It is divided into the ascending, the transverse, and the descending C., and the sigmoid flexure. See ALIMENTARY CANAL.

The whole length of the C., from its commencement in the cæcum, to its termination in the rectum, is rather more than four feet. It is retained in its position by the serous membrane, which envelops, more or less, all the intestinal viscera, and is termed the Peritoneum (q. v.). Its structure is essentially the same as that of the rest of the intestinal canal, which is described in the article DIGESTION, ORGANS AND PROCESS OF; but in consequence of a peculiar arrangement of the longitudinal muscular fibres, the interior of the C. is divided into sacculi, which serve to retain its contents for a longer period than if it were a uniform tube, and thus by extracting water from them, to reduce them to a more solid consistence, such as is possessed by normal excrement. In some animals, as in the horse and sheep, the shape of the fæces is completely moulded in these cells.

CO'LONEL (from the Italian *colonello*, the leader of a column) is the highest officer of a regiment; any grade above this converts him into a general-officer belonging to the army collectively, rather than to any one regiment. Before the reign of Elizabeth the chief officer of an English regiment was captain, but in 1588 the title of C. had become familiar. In the British army at the present day, except in the Artillery and Engineers, the office of regimental C. is a sinecure, the real active commander of the battalion being the lieutenant-colonel. The C. receives higher pay and dignity. The colonels are generals, who have had what is called a regiment 'given to them,' as a reward for long service, and virtually as a retirement. The pay, except in the Guards (where it is higher) is £1000 a year.

The Army Estimates provide for about 150 regimental (otherwise called 'honorary') colonels of cavalry and infantry, and for about a sixth of that number colonels commandant in connection with the Artillery and Engineers. There is a frequent outcry against these appointments when viewed as sinecures, but looked upon as retirements for deserving old officers there is little that is objectionable in them. The rank of C. was above those which were purchasable. See COMMISSIONS, ARMY. Apart from regimental rank there is the army or brevet rank of colonel, through which all officers must pass on the way to general-officer. It is attained by specified service in certain positions as lieutenant-colonel. In the Austrian, Prussian, and Russian armies, where the regiments are very large, the colonelcies are mostly honorary posts, held by emperors, kings, princes, and other distinguished persons.

COLO'NIA DO SANTI'SSIMO SACRAME'NTO, a port of Uruguay or Banda Oriental, stands on the north or left bank of the Plata, nearly opposite to Buenos Ayres, and about 100 miles above Monte Video, the capital of the state. The place is pretty regularly fortified. As its acquisition would tend to secure to Buenos Ayres the entire command of the interior navigation, the town was seized by Rosas, the dictator of that state; but, in the interest of the freedom of commerce, it was, in 1845, taken from him by the French and English squadrons.

COLO'NIAL CORPS were certain regiments forming part of the regular army of the British Empire, and paid for out of the imperial revenues. They were never very fixed in number, varying with the circumstances of the colonies in which they were located. The following were the names of the corps, the numbers provided for in the Army Estimates for 1860—1861, when these regiments were at their largest recent establishment, and the composition of each corps, whether British or native:

Three West India Regiments (afterwards raised to five	3420	Negro.
Newfoundland Veterans	229	British.
Ceylon Rifles	1585	Native.
" Invalids	163	Native.
Cape Mounted Rifles	1084	Boers and natives.
Malta Fencibles	638	Native.
Canadian Rifles	1106	British.
St. Helena Regiment	433	"
Gold Coast Artillery	351	Native.
Falkland Islands Company	37	British.
African Artillerymen	64	Native.
Hong-Kong Gun Lascars	88	"

These corps, comprising about 95 companies, had somewhat over 1000 officers, commissioned and non-commissioned, and about the same number of horses. All the corps were officered by British, except the Malta Fencibles. The Cape Mounted Rifles was a mounted infantry corps.

As the colonies obtained self-government, and the military theory of employing troops only in large bodies gained ground, it was considered as against imperial polity to maintain, out of imperial revenue, corps which were tied to one colony, and not available for the general defence of the Empire. Accordingly the colonial corps have been gradually disbanded, and there survive only two West India Regiments and the Malta Fencibles.

COLO'NNA, a village in Central Italy, is noticed because it gives its name to the most celebrated and powerful of all the Roman aristocratic families—the Colonna—from which have sprung a pope, several cardinals, generals, statesmen, and noted scholars.

The C. palace, situated at the base of the Quirinal (Rome), is celebrated for its splendid gallery and treasures of art.

COLONNA, CAPE (ancient *Sunium Promontorium*), a headland of Greece, forming the southmost point of Attica, in lat. 37° 38′ N., long. 24° 1′ E. Crowned by the ruins of a temple of Minerva, its summit rising about 270 feet above the water, Cape C. is a conspicuous and remarkable object from the sea. Sixteen white marble columns, from which the cape derives its modern name, are still standing.

COLONNA, VITTORIA, the most celebrated poetess of Italy, a member of the above-named family, was the daughter of Fabrizio Colonna, High Constable of Naples, at whose estate of Marino she was born in the year 1490. When four years old, she was betrothed to a boy of the same age, Fernando d'Avalos, son of the Marchese de Pescara. At 17, they were married. After her husband's death in the battle of Pavia (1525), Vittoria C. found her chief consolation in solitude and the cultivation of her poetical genius. During seven years of her widowhood, she resided alternately at Naples and Ischia, and then removed to the convent of Orvieto, afterwards to that of Viterbo. In her later years she left the convent, and resided in Rome, where she died in February 1547. Her poems were chiefly devoted to the memory of her husband. Among them, the *Rime Spirituali* (Venice, 1548) are remarkable for truth of sentiment and enlightened piety. The most perfect edition of the poems of Vittoria C. was published by Ercole Visconti (Rom. 1840).

COLONNA'DE is the name given to a series of columns placed at certain intervals from each other, and arranged in various ways according to the rules of art and the order employed.

CO'LONSAY, one of the Western Isles of Scotland, off the south-west part of the mainland of Argyleshire, in the wide entrance of the Firth of Lorn, between the isles of Islay and Mull, with the small isle of Oronsay at the south end, separated by a narrow sound, which is dry at low water. C. and Oronsay are together 12 miles long from north-east to south-west, and one to three miles broad.

The surface is irregular, and composed of mica-slate, passing into chlorite-slate and clay-slate, and mixed with quartz-rock and limestone. Half the surface is cultivated. Pop. (1881) 387. Next to Iona, C. contains the most extensive remains of religious edifices in the Western Isles. On Oronsay stand a large stone cross and the ruins of a monastery founded by the Lords of the Isles in the middle of the 14th c.

CO'LONY (Lat. *colonia*, from *colonus*, a husbandman; the first inhabitants of a C. being generally people of agricultural pursuits). The term is loosely used to embrace various classes of distant territories subordinate to or dependent on a parent state. A C., however, properly means a body of people formed by migration to a distant region, where they support themselves by in-

dustry and the produce of the soil, and are under the protection and attached to the supreme government of the mother-country. Our colonies in Australia and North America, where the natives have either ceased to exist, or do not compete with the colonists for the ownership of the soil, are practical instances of the C. in this its proper sense; but there are many other dependencies of of the British crown which deviate more or less from the true characteristics of a colony. Gibraltar and Malta, for instance, are mere fortresses, not affording a profitable emigration-field for a portion of our population, but, on the contrary, requiring that such inhabitants of the United Kingdom as reside there shall be specially remunerated for doing so. The support of these dependencies is justified by the warlike, not the economic policy of the country. On the other hand, territories have afforded profitable residence to our people without being colonies; the most conspicuous of this class is the British Empire in Hindustan, where our people scarcely hold any land, or concern themselves in the occupation of agriculture, from which the term colonist is taken; but reside as the rulers and defenders of the native races. The ancient migrations of nations, by which our own islands, for instance, became peopled, apparently in the first place by Celts, and next by Goths or Teutons, were not colonization in the fullest sense of the term, since the parent-country kept no control over the settlers, and afforded them no protection. The Greeks were a spreading people, carrying with them their genius and their language. They established communities in Asia Minor, on the coast of Africa, in Italy, and in France; for instance, Marseille was a Greek town, founded by the inhabitants of Phocæa about six centuries before the Christian era. A close connection was maintained between these emigrant communities and the states from which they had removed. Still, however, none of these districts were colonies, according to the definition given above; and it was one of the many triumphs of the organizing genius of the Romans, to form the 'C.' according to its most perfect modern acceptation. The principle of responsibility to a central government was brought to its greatest perfection in the policy of Rome, and it was part of this policy that not only every conquered territory, but every district where Roman citizens settled, should be an integral part of the empire.

The *colonia* was one of the municipal institutions of the empire, having its own governing corporation dependent on Rome. There were various grades of colonies—some where there was the high privilege of Roman citizenship, and others, where the citizenship was of a humbler grade. Corresponding with the consuls in Rome, there were municipal officers in the colonies, representing, after the Empire was formed, the old republican institutions—these were called sometimes *duumviri*, and sometimes *quatuorviri*—terms, the special application of which has been matter of considerable discussion. The Romans appointed men of very high rank to the government of their provinces or colonies—men who had held such offices as the consulship or prætorship at home, and were called proconsuls or proprætors. It was a feature of the sagacious jealousy of the Roman system, to limit their period of government, lest they should become independent of the empire, and establish separate states; and this idea is followed in the colonial system of the British empire at the present day.

After the fall of Rome, centuries passed before colonization recommenced; for the various tribes who devastated the empire were not connected with any parent state, and the Normans, who spread themselves over Europe at a later period, were utterly unconnected in the countries where they settled, with the government of the northern states whence they migrated. It is curious that not a trace of the genealogy of the Normans of England or France can be found anterior to their settlement in the latter country, so little connection did they preserve with the country of their ancestors. The Spanish and Portuguese were the first among modern European states to establish colonies. Their sovereign aimed not only at the restoration of the Roman empire in Europe, but at the creation of a new empire in America, which was looked on as the exclusive property of the Spanish crown. In carrying out this view, it was not so much that the people of the peninsula went to America, and had the necessary staff of civil and military officers sent to them by the parent state, as that great officers, with high rank and enormous salaries, were sent over to the new empire, and brought followers after them. The other governments of Europe—Britain, France, Holland, and the minor states—subsequently colonized in America and Africa, Denmark occupying the inhospitable shore of Greenland.

The earlier British colonies arose in the reverse order to those of Spain—the colonists went first, the dignitaries followed. Both Raleigh and Drake attempted to form settlements in America, but unsuccessfully. The British race there dates from the reign of James I. of England. The settlers were privileged companies, with royal letters-patent, but, in reality, they were independent; and as they were dissenters seeking a place of refuge from what they considered the grievances of the established church and the government, they took care not to convey the grievance with them, as they would have done had they been actually incorporated with the British empire.

The northern colonists, indeed, acted as if they were a sort of private corporation, occupying their own territorry according to their own taste, and considered themselves entitled to prohibit any person differing from their religious and political opinions from entering their boundary. In later times, the example of Rome was more closely followed, and it became the policy of Britain, that any land acquired by her subjects by conquest or occupation, should be deemed to be held by them for the crown. This was strongly exemplified in New Zealand, where a body of energetic and spirited adventurers had projected something like a new empire, of which they were to be masters. Some of them had purchased large territories for a musket, a barrel of powder, or a piece of red cloth, and thought it hard that they should not be entitled to retain the fruit of their fortunate bargains. The crown, however, stepped in, asserted a supreme authority over the colony, and readjusted all its territorial rights, with a view to doing practical justice both to the natives and the settlers. There are many evils incident to any attempts at independent colonization, among which, the chief is the cruelty and rapacity which it is the nature of such private adventurers to exercise against aboriginal tribes, and even against any other communities weaker than themselves who happen to fall in their way. The British colonists of the American continent and islands in the 17th c. were robbers and pirates on a large scale, and became memorable in history by the name Bucaneers. Colonists themselves, when they rightly appreciate their own interest, must see their advantage in the supremacy of the crown—or rather in that of the British parliament—for the crown is only properly supreme over a territory which has been taken by conquest from another civilized power. The supremacy implies a right to protection, much needed by small collections of men in distant regions; and it may be safely predicted, that had an independent body of British settlers established themselves in New Zealand, their C., when it rose to importance, would have been seized by France, or some other foreign power. After the example set by the United States, it is not likely that the supremacy will be continued after it ceases to be advantageous to both parties.

Many fallacies regarding colonies have been dispersed by the progress of political economy. It used to be thought, that the support of colonies at any price was an advantage to our trade, since it is more profitable to trade with our colonies than with foreign countries, because, among other reasons, they can be compelled, by restrictions and monopolies, to take our goods while we take theirs; but other nations cannot, and may continue to sell to us without buying from us. We now know that the best trade for the country, is that which the individual dealers in it find to be the best for themselves; and they will go where they can trade with most profit, whether to a C. or a foreign country.

It was when the United States were rich and enterprising—not when they were our colonies—that we have driven the greatest trade with them. No doubt, there must always be two parties in trade; and let a nation be as energetic and enlightened as it may, it will have no foreign trade unless there be some other that can afford and is inclined to deal with it. If the population of the United States were displaced by Red Indians, there would be a sudden collapse in the trade of Britain. For such a reason it is that we have an interest in seeing our own race—the most enterprising in the world—spread over its face. Every new British C. may be calculated on as a new market for our goods; and as a pecuniary speculation, it may be worth supporting a governor and a staff of officers to take charge of it.

CO'LOPHON, an Ionian city of Asia, about nine miles north of Ephesus, and near the sea-coast. The river Ales, noted for the coolness of its water, flowed past it. It is not often mentioned in history, although the birthplace of several poets, Mimnermus, the elegist, among others, and even claiming to be the native city of Homer. The Greek proverb, 'to put the colophon to it,' meaning to terminate an affair, is said to have originated in the boast of the famous Colophonian cavalry, that their *charge* was usually the finishing-stroke in battle. Hence, in old printed books, the conclusion, in which were stated the name of the author, and the place and year of printing, was called a colophon.

COLO'PHONY. See Rosin.

COLOQUI'NTIDA. See Colocynth.

COLORA'DO (Sp. red), the name of a state and also of two rivers of the United States. The state is bounded on the N. by Wyoming and Nebraska, E. by Kansas, S. by New Mexico, and W. by Utah. Its area is 104,500 sq. m., and the pop. in 1870 was 39,864; in 1880, it had risen to 194,649. The Rocky Mountains intersect the state from N. to S., but it has large and fertile valleys. That of San Luis, in the south, is an immense well-wooded amphitheater, surrounded by mountains, with an area of 18,000 square miles. The mineral resources of C. are very great, and include gold, silver, copper, gypsum, coal, salt, iron, and limestone. Value of gold and silver produce (1878), 8,800,000

dollars; (1880) 19,250,000. At that date, C. was foremost of the states for silver production, and fourth for gold. Denver (the capital), Leadville, and Central City, are the principal towns. C. was formed into a territory in 1861, and admitted into the Union as a state in 1876.—Of the rivers named C., one is confined to the state of Texas, is 800 miles long, and falls into the Gulf of Mexico. The other rises in the Rocky Mountains, and enters the Gulf of California, about lat. 32° 10′ N., and long. 114° 20′ W., after a course of 1200 miles.

COLORADO (*Rio C.* or *Colorado River of the West*) is formed at about 38° N. lat. and 110° W. long. by the junction of the Green and Grand rivers. The Green River rises in the Rocky Mountains in the W. of Wyoming Territory, receiving in its S.W. course the waters of the Bear, the White, Uintah, and San Rafael. From Flaming Gorge, a point in the N.W. of Colorado, where the Uintah Mountains rise, the Green River cleaves its way rapidly through 'cañons,' the walls of which tower up to a height of nearly 1500 feet. (Cañon, Spanish for tube, is now commonly used in the United States for deep ravines worn by running waters). The Grand River rises in the Rocky Mountains to the W. of Denver, Colorado; receiving in its S.W. course the South Fork or Gunnison, the San Miguel, and Dolores. After the junction, the C. flows S.W. through Utah, joined on the E. by the San Juan, on the W. by the Dirty Devil and Escalante; S.W. through the N. of Arizona, till its waters are increased by the Colorado Chiquito or Little C. of Arizona. From the mouth of the Little C., the river bends W., and for the first 200 miles shoots through the remarkable 'Grand Cañon.' The walls of this water-worn trench are often vertical, or nearly so, for a distance of thousands of feet at a time; sometimes they slope steeply, or constitute magnificent terraces. The cliffs or rock-walls attain a height of from 4000 to 7000 feet above the stream, which runs with a varying descent of from 5 to 200 feet to the mile, and whose channel now contracts to 30 feet in breadth, and now widens to 300 feet. In many parts there is no talus of fallen rocks, still less banks of gravel or earth; but the stream fills the channel from wall to wall. Elsewhere masses of fallen rock from 30 to 300 feet high line the sides of the rock. Below the cañons there is, in the valley, much fertile bottom-land on one or both sides of the river. Numerous tributaries pierce the high plateau on either side, the whole presenting a strangely intersected topography. Escaping from the Grand Cañon, the river flows S.W. to the borders of Nevada, receiving from the W. the Paria, Tapeat's River and the Kanat of Arizona, and the Virgen of Nevada. Above Callville, Nevada, the C., as also its tributaries, again bores its way through deep cañons, the sides of which in some places present walls of solid rock nearly 7000 feet high; the plateaus at the top of these rock-masses, generally treeless, are again surmounted by terraces of 1000 feet or more in height. These lower and higher terraces are both piled with massive ruins, once the walled towns and cities of the Toltecs, as is supposed, a race said to be represented by the present Moqui Indians in the N.E. of Arizona. Below Callville the river is again shut in by the last of the cañons, the Black Cañon, 25 miles long, and from 1000 to 1500 feet high. Shortly after receiving the Virgen, the C. takes a southern course, severing Arizona and Sonora on the E. from Nevada, California, and Lower California on the W., and receiving on the E. Bill Williams's Fork and the Gila.

After absorbing the Gila, the river sweeps round in a westerly direction for 7 or 8 miles, and soon expands to a width of 1200 feet. Thence it pursues a tortuous course of 180 miles, the last portion being through Mexican territory, to its mouth in the Gulf of California. From the sources of the Green River, the C. measures a total length of about 2000 miles. It is navigable for steamers as far as Callville, 612 miles from its mouth; and can be made navigable, it is thought, to the foot of the Grand Cañon, 57 miles higher. At low water (winter), vessels drawing 9 feet can reach only to Arnold's Point, 35 miles up. From the rapid rise of the tide, and the shifting of the channel, navigation is difficult to the head of tide-water, 40 miles from the mouth. The cañons of C. were descended in 1867 by James White, the sole survivor of a party prospecting for mines; and in 1869, by Major J. W. Powell, at the head of an exploring party sent by the U.S. Government. See Powell's *Exploration of the Colorado* (Washington, 1875).—Another Colorado, 900 miles long, flows S.E. through Texas into the Gulf of Mexico; a third, 600 miles long, flows from the Andes across the Argentine Republic.

COLORA'DO POTA'TO BEE'TLE (*Doryphora decemlineata*), a small beetle, which, since 1861, has done great harm to the potato crops of the United States. It is of a yellowish cream-color, with ten black lines running down the wing covers. The *larvæ*, which do the principal mischief, are at first reddish brown, and get paler with increasing age.

COLO'SSÆ, a populous city of ancient Phrygia, on the river Lycos. Its inhabitants were noted for their skill in dyeing wool. C. was almost entirely destroyed by an earthquake, 65 A.D. To the Christians of C., Paul addressed one of his epistles.

COLOSSE'UM. See AMPHITHEATER.

COLO'SSUS, a Greek word of unknown origin, used to denote a statue very greatly beyond the size of life. In English, the adjective colossal is used in a somewhat wider sense, to denote all statues which exceed the size of life, in however small a degree. Most statues are thus colossal, though of colossi, very few have been erected in modern times. The 'Bavaria' (q. v.) at Munich is perhaps the only very celebrated example. The colossal was the peculiar characteristic of Egyptian art, and innumerable colossi were raised in Egypt, mostly of the hardest stone, many of them from 50 to 60 feet in height. The most celebrated is the vocal statue of Memnon (q. v.), in the plain of Thebes, described by Strabo and Pausanias, and supposed to be identical with the more northerly of the two existing colossi on the west bank of the Nile.

But it was in the artistic world of Greece that the most famous colossi appeared: e. g., the bronze statue of Pallas Athene, on the Acropolis of Athens, the plume of whose helmet and the point of whose spear were landmarks to sailors between Sunium and Athens; another statue of the same goddess, of gold and ivory—the so-called Palladium in the Parthenon at Athens; and the Olympian Jupiter, of the same materials, the master-piece of Phidias, who was also the author of the two statues just mentioned. Amongst the seven wonders of the Old World, was reckoned the gigantic C. of Rhodes, representing Phœbus, the national deity of the Rhodians. It is said to have been commenced by Chares, of Lindus, a famous pupil of Lysippus, and terminated by Laches. They formed it of metal, which was cast in separate pieces, a process which lasted for twelve years, and was completed 280 B.C. Its height is doubtful—some making it 90 feet; others 90, and even 105 cubits. It cost 300 talents. Sixty years after its erection it was thrown down by an earthquake. The Romans imitated the Greeks in the erection of these gigantic structures. The statue of Jupiter upon the Capitol, made from the armor of the Samnites, was so large that it could be seen from the Alban Hills. Then there was the bronze statue of Apollo, of which what is supposed to be the head is now in the Capitol; a bronze statue of Augustus, in the Forum; a C. of Nero, executed in marble, of the enormous height of 110 or 120 feet, from which the contiguous amphitheater is believed to have derived the name of 'Colosseum;' an equestrian statue of Domitian, in the center of the Forum; and many others.

COLO'STRUM is the term applied to the first milk yielded after delivery. It differs very materially from ordinary milk, and generally appears as a turbid, yellowish, viscid fluid, similar to soap and water. When examined under the microscope, it is found to contain, in addition to the ordinary milk corpuscles (see MILK), peculiar conglomerations of very minute fat granules, which are hence known as colostrum corpuscles. The chief chemical difference between C. and milk is, that the former contains nearly three times more salts than the latter. It is probably this excess of salts that usually causes it to exert a purgative effect upon the new-born infant, and thus to remove the Meconium (q. v.) which had accumulated in the fœtal intestine.

CO'LOR, in Optics. See LIGHT, CHROMATICS, SPECTRUM.

COLOR, in Art, means either the pigment employed to produce a certain effect to the eye, or the effect thus produced, i. e., the tint of a picture. In the former sense, it is treated of in this work under the names of the colors themselves. See CARMINE, CHROME, &c. In the latter sense, C. must be regarded by the artist not so much as the result of the application of one or more pigments separately, as of their use in the innumerable combinations of which they admit.

Recent investigation tends to regard as simple or primary colors *red*, *green*, and *violet*. It is found impossible to resolve red, green, and violet (or blue) light into any other colors; whereas a yellow ray may be resolved into red and green, or compounded by mingling red and green light. But in popular acceptation, as in the scientific works of Brewster and others, the primaries are *red*, *blue*, and *yellow*. See CHROMATICS, SPECTRUM, LIGHT, &c. Compounded in various proportions, pigments of the three last-mentioned colors produce every tint that is physically posssible, and in this respect may still be called primary. First, when combined in twos, they produce the three colors usually termed *secondary*—that is to say, blue and red make purple or violet; yellow and red, orange; blue and yellow, green. The grays and browns, again, are compounds of all three of the primary colors.

COMPLEMENTARY COLORS are the colors or color which, with any color or colors mentioned, make up the three primary colors, which constitute white light. Thus, if the given C. be a primitive, its complementary C. is composed of the other two primitive colors; e. g., the complementary color of blue is orange = red and yellow. Again, if the given C. be a secondary, its complement-

ary C. is the remaining primitive color. Thus, the complementary C. of green—blue and yellow—is red.

CONTRAST OF C. is either simple or compound. Each of the primitive colors forms a simple contrast to the other two. Thus, blue forms a simple contrast to red and to yellow. But if red and yellow be mixed together, the complementary C. to blue will be produced—viz., orange, which is the most powerful contrast that can be made to blue.

HARMONY OF C. consists in the preservation of the same character in a picture throughout, in so far as coloring is concerned. It is said to result from an equal distribution of the three primary colors, either pure or in composition; but such a rule, even if correct, is correct with so wide a latitude as scarcely to admit of practical application. The only method of attaining to a knowledge of harmony of C., is to train the eye by the observation of it as exhibited in nature. A southern sky will be found to harmonize with a southern landscape, and consequently, the colors of which the one is composed with those which compose the other. The experiment may be made by painting an Italian sky over an English landscape, when the want of harmony in the coloring will be at once apparent. The art of preserving harmony without sacrificing variety, resembles that of preserving light in shadow, and combining clearness with depth, which we have explained under CHIAR-OSCURO.

WARM AND COLD COLORS are terms derived from the corresponding sensations which they are supposed to produce. Blue is said to be a cold C., and orange a warm one, whereas red is neither warm nor cold. Without supposing color-blindness, however, it seems very possible to imagine that in this respect the same C. may, from association and other causes, produce different sensations on different persons.

A COLORIST is an artist in whose works success in color is the prominent excellence. The greatest colorists are Titian, Correggio, Paul Veronese, Rubens, and perhaps his pupil Vandyck. To say that these artists surpass Raphael, or even Leonardo da Vinci, in this respect, would probably be to say too much. But that they equal these greater artists in this, and in this respect alone, is a sufficient reason for their being known as colorists *par excellence*. The art of coloring admits of being transmitted to pupils to a greater extent than the highest branch of all.

COLOR, a rhetorical term, which was adopted into the technical language of English pleading. Previous to the passing of the Common Law Procedure Act of 1852 (15 and 16 Vict. c. 76), it was a rule that pleadings in confession and avoidance, as opposed to pleadings by way of traverse, should confess the matter adversely alleged, to the extent at least of admitting some apparent right in the opposite party requiring to be encountered and avoided by the allegation of new matter. This was called giving C. to the plaintiff's claim. All this curious subtilty, to which English lawyers till recently were in the habit of attaching so much value, was very properly set aside by the statute above referred to. The section which applies to *C.* is the 64th.

COLOR, in Heraldry. The colors used are generally red, blue, black, green, and purple; which are called Gules, Azure, Sable, Vert or Sinople, and Purpure. Tenne or tawny, and Sanguine or blood-color, sometimes occur, but they are not common. Yellow and white, again, are not colors in the heraldic sense, but metals; they are called Or and Argent, and are always represented by gold and silver. It is a fundamental and invariable rule in blazon, not to put C. upon C., or metal upon metal; thus, if the field be of a metal, the bearing must be of a C., and *vice versâ*. The only exception is said to be the arms of Jerusalem, which were given to Godfrey of Bouillon, which are *argent, a cross potence or, between four crosslets of the same.* Apparent exceptions to this rule in common blazon are—1. Abatements or marks of cadency or difference, labels, crescents, batons, and the like; and 2. Extremities or adjuncts to animals, or other objects, such as tongues, claws, horns, &c.; but neither of these are regarded as independent bearings. Colors and metals, when engraved, are generally indicated by dots and lines: *or*, gold, by dots; *argent*, silver, is left plain; *gules*, red, is indicated by perpendicular lines from top to bottom; *azure*, blue, by horizontal lines from side to side; *sable*, black, by horizontal and perpendicular lines crossing each other; *vert*, by diagonal lines from right to left; *purpure*, by diagonal lines from left to right; *tenne*, by diagonal lines from left to right, crossed by horizontal lines; and *sanguine*, by lines crossing diagonally from left to right, and from right to left.

CO'LOR-BLI'NDNESS, a term introduced by Sir David Brewster to denominate a defect of vision, owing to which certain persons are either unable to discern a single color, such as red, or to distinguish between two colors, such as green and red, so that they may be said to be blind to red, or to be blind to one of two colors presented simultaneously to the eye. This defect has been called *chromato-pseudopsis*—i. e., false vision of colors; Daltonism, after Dalton the chemist, who suffered under it; and various other learned names, have been applied to it; but C. seems to be as apt and expressive a name as any. It occurs in eyes whose power of vision, as to form and distance, is otherwise perfect. The late Dr. George Wilson, whose work on this subject should be consulted by the reader (*Researches on Color-blindness*, Edin. 1855), thus classifies the varieties of the defect: 1. Inability to discern any color properly so called, so that black and white—i. e. light and shade—are the only variations of tint perceived. 2. Inability to discriminate between the nicer shades of the more composite colors, such as browns, grays, and neutral tints. 3. Inability to distinguish between the primary colors, red, blue, and yellow, or between these and the secondary and tertiary colors, such as green, purple, orange, and brown. The first sort would appear to be very rare, but well-marked cases of it are on record, and show that insensibility to colors is not only compatible with distinct vision in other respects, but is frequently attended by a greater power than is usual of perceiving objects very faintly illuminated. None of these recorded cases, however, have been examined with such care as to warrant the conclusion, that the C. was absolute. It would appear that where the C. is nearly absolute, degrees of luminosity supply the place of shades of color in giving variety to the aspects of objects. The second variety of C., where the nicer shades of the more composite colors are mistaken, would appear to be very common—the rule rather than the exception in the majority of persons, at least of the male sex, in this country; but it is a matter of doubt how far it may not be referable to imperfect cultivation of the sense of color. In many cases of this kind, however, it can be shown that the defect differs in degree only from that of the third form. The third form is the most important variety of the affection. In extreme cases, although colors are occasionally quite correctly named, there is no certainty as to any color: in less severe cases, two colors, at least, as red and green, and generally four, as red, green, olive, and brown, are not distinguished from each other. Yellow would appear the color which gives least difficulty to those not absolutely unconscious of color; while blue, if pure and well illuminated, is readily recognized by the color-blind, a few of whom, indeed, describe it as the color which they see best. Red appears to be the color the want of the sense of which may be said to characterize all the color-blind. Indeed, Dr. Wilson thinks C. might properly enough be called *Anerythric* (No-red) vision. He says that while the normal eye analyzes white light into three colored elements, one of which is *red*, the color-blind eye, on the other hand, analyzes white light into two elements, neither of which is red.

The eyes of persons having this defect of vision have been carefully examined after death without the discovery of any peculiarity. C. therefore has its seat in the sensorium, not in the visual apparatus.

C. would appear to be very prevalent. Of 1154 persons of various professions, examined in 1852 and 1853 at Edinburgh by Dr. George Wilson, 65, or 1 in 17·7, were color-blind; 21 confounded red with green; 19 confounded brown with green; and 25 confounded blue with green. In consequence of this prevalence of the defect, the investigations into its nature are of the greatest practical importance. Railway officials, for instance, should always be tested for it, lest, being color-blind, they should mistake the various signals in use on lines of rail, and thus cause accidents.

Sir David Brewster, Sir John Herschel, Professor Maxwell, and many others, have written on the subject of color-blindness. Perhaps the most ingenious investigator of C., and the phenomena of vision generally, is Professor Maxwell, whose writings thereon in the Transactions of the Royal Societies of London and Edinburgh, will well repay perusal.

COLORING, as a musical term, is applied to those passages and harmonic progressions in bravura airs affording the singer an opportunity of display. It is also applied to all grand harmonic combinations in orchestral compositions.

CO'LOR-PRI'NTING. See POLYCHROME PRINTING.

COLORS, THE DIATONIC SCALE OF. Sir Isaac Newton, when investigating the properties of light, discovered that the lengths of the spaces occupied in the Spectrum (q. v.) by the seven so-called primary C., exactly correspond to the lengths of chords that sound the seven notes in the diatonic scale of music. Hence the phrase, *the diatonic scale of colors.*

COLORS, MILITARY, are certain kinds of flags carried with the army. Standards, banners, pennons, guidons, ensigns, colors—all are military flags, each originally having a distinct meaning, now to some extent departed from. The ensigns were the original of those which are now called C., and which especially belong to infantry regiments. The C. are square flags, larger than the standards carried by the cavalry. In former times, there was one for each company; but now there are generally two for a battalion, constituting a 'pair of C.'; one of which is called the royal or first, and the other the regimental or second. Both are about 6½ feet by 6, made of silk, with cords and tassels of crimson and

gold, and fixed to a staff about 10 feet long. The royal color or flag is nearly alike for all the regiments; with a blue ground, an imperial crown, the number of the regiment, and the Union Cross of St. George, St. Andrew, and St. Patrick. The regimental C. depends for its tint on the facings of the uniform of the regiment; in its center is inscribed the number or designation of the regiment, with its crest and motto, if any; and around are the names of the victories and campaigns in which the corps has served.

A subaltern officer carries the colors, and certain non-commissioned officers are set apart as a guard. The C. symbolize the good name and fame of the regiment, and are on that account protected in action with sedulous care; a victor always counts among his achievements the number of C. captured from the enemy. When a regiment obtains new C., they are usually solemnly presented by some lady of distinction. The presentation is made with much military pomp; and the chaplain of the regiment reads a prayer prepared for the occasion. A member of the Heralds' College is 'inspector of regimental colors,' the post being at present held by Garter-King-at-arms.

Besides the 'pair of C.,' there are small *camp* C., of the same tint as the facings of the regiment, to designate the part of the camp the corps occupies. Rifle regiments do not carry colors.

CO'LOR-SE'RGEANT, in the Army, is a non-commissioned officer of higher rank and better pay than the ordinary sergeants. There is one to each company of infantry; and the office is specially given to meritorious soldiers. The C. wears an honorary badge over the Chevrons (q. v.), and receives 2*s*. 5*d*. per day. He fulfils the ordinary regimental and company duties of sergeant; but in addition to these, he attends the colors in the field, or in the front of a camp, or near headquarters in a garrison. A C. may be degraded to the rank of sergeant for misbehavior, but only by the decision of a court-martial.

CO'LT'S-FOOT. See TUSSILAGO.

COLT'S REVO'LVER. See PISTOL, REVOLVER.

CO'LUBER, a genus of serpents which, as defined by Linnæus, included an extremely miscellaneous assemblage of species, venomous and not venomous, agreeing only in the character of having a double row of plates on the under side of the tail. The venomous species are now excluded, not only from the genus C., but from the family *Colubridæ*, of which it is the type. The serpents of this family are very numerous: it includes, indeed, about one-half of all the known serpents in the world. Their geographic distribution is very wide, although they chiefly abound in the tropics. Some of them are terrestrial, and some arboreal in their habits, the latter chiefly natives of the tropical parts of Asia and America. A few are inhabitants of fresh waters, and feed on fish. They are active in the pursuit of their prey, some of them feeding chiefly on small birds and quadrupeds, some on insects. They do not kill their prey by constriction, like the boas. Some of them are singularly and brilliantly colored. A few, particularly of the arboreal species, are remarkable for their extremely lengthened form. None of them grow to a very large size. To this family belong the common Ringed Snake (*Natrix torquata*) of England, the only British species. To the genus *C.* belong the Black Snake (q. v.) of America, and the Serpent of Æsculapius (*C. Esculapii*). figured by the ancients as an attribute of their god of medicine, It is of a brownish color, and attains the length of four or five feet. It is found in the center and south of Europe, is easily tamed, and exhibits the greatest gentleness of manners.

COLU'GO. See FLYING LEMUR.

COLU'MBA, ST. (called also ST. COLUM-CILLE and ST. COLM), one of the greatest names in the early ecclesiastical history of the British Isles, was born (it is believed, at Gartan, in the county of Donegal) in the north of Ireland, on the 7th of December 521. His father, Fedhlimidh, of the powerful tribe of the Cinel Conaill, was a kinsman of more than one chief or prince then reigning in Ireland and in the west of Scotland; and his mother, Eithne, was also of royal descent. To this distinguished parentage, no doubt, he owed some measure of his great influence upon the minds of his countrymen.

He studied first at Moville, at the head of Strangford Lough, under St. Finnian, by whom he was ordained a deacon; and afterwards under another St. Finnian, at Clonard, where he was ordained a priest. Among his fellow-disciples, he is supposed to have had St. Comgall, St. Ciaran, and St. Cainnech; and so conspicuous was his youthful devotion, even in that saintly company, that he received the name by which he is perhaps still best known in Ireland—'Colum-cille,' or 'Columba of the Church.' In 546, when no more than twenty-five, he founded Derry, and, six or seven years afterwards, Durrow, the greatest of all his Irish monasteries. He seems now to have embroiled himself in the civil strifes of his country; and the belief that he instigated the bloody battle of Cooldrevny, in 561, led to his excommunication by an Irish ecclesiastical synod. The justice of the sentence was challenged by ecclesiastics of rank, but it was probably among the causes which determined him to leave Ireland.

It was in 563, when in his 42d year, that, accompanied by twelve disciples, he set sail for the little island of Hy or Ioua, as it was then called—now better known as Iona (q. v.), or I Columcille—of which he obtained a grant, as well from the king of the Picts as from his kinsman the king of the Scots. Having planted a monastery here—built, it would seem, chiefly of wattles—he set himself to the great work of his life, the conversion of the Pictish tribes beyond the Grampians. The Picts dwelling to the south of that mountain barrier had been converted by St. Ninian of Whithern, in the 5th c.; and the Scots who peopled the western shores and islands of Scotland, were either Christians before they passed over from Ireland, or were afterwards converted by Irish missionaries. St. C. now brought the Picts of the north to the true faith; but, unfortunately, very little is known of the way in which he accomplished his task. Bede speaks simply of his 'preaching and example.' Adamnan, extolling his gift of miracles, tells how the gates of the Pictish king's fort burst open at his approach, and how, as he chanted the 45th Psalm, his voice was preternaturally strengthened, so as to be heard like a thunder-peal above the din and clamour by which the Pictish magicians tried to silence his evening-prayer under the walls of the Pictish palace.

We get another glimpse of his missionary footsteps from the *Book of Deer*, a Celtic MS. of the 11th or 12th c., lately discovered at Cambridge. It records how 'Colum-cille and Drostan, the son of Cosreg, his disciple, came from Hy, as God had shown them, to Aberdour' (a beautiful little bay among the huge cliffs which fringe the coast of Buchan, as the north-east district of Aberdeenshire is still called); how 'Bede, a Pict, was then high steward of Buchan, and gave them that town in freedom for evermore;' how 'they came after that to another town, and it was pleasing to Colum-cille, for that it was full of God's grace; and he asked of the high-steward, Bede, that he would give it to him, but he gave it not; and, behold, a son of his took an illness, and he was all but dead, and the high steward went to entreat the clerics that they would make prayer for his son, that health might come to him; and he gave in offering to them from Cloch-in Tiprat to Cloch-Pette-mic-Garnait; and they made the prayer, and health came to him.' In some such way as this, St. C. and his disciples seem to have traversed the Pictish mainland, the Western Islands, and the Orkneys, establishing humble monasteries, whose inmates ministered to the religious wants of the people. The parent-house of Iona exercised supremacy not only over all these monasteries, but over all the monasteries which St. C. had built in Ireland, and over those which were founded by his disciples in the northern provinces of England when they converted the Angles and the Saxons. Thirty-four years appear to have been spent by St. C. in raising up and perfecting his ecclesiastical system in Scotland. But the labor did not so wholly engross him, but that he found time for repeated voyages to Ireland, and for a visit to Glasgow, where St. Kentigern or Mungo was restoring Christianity among the Welsh or British tribes of Cumbria and Strathclyde. The health of St. C. seems to have begun to fail in 593, but his life was prolonged till he reached his 77th year, when he breathed his last as he knelt before the altar of his church in Iona, a little after midnight, between the 8th and 9th of June 597. He was buried within the precinct of his monastery, and his bones—which were afterwards enshrined—the stone pillow on which he slept, his books, his pastoral staff, and other things which he had loved or used, were long held in great veneration. No composition certainly known to be his has been preserved; but there have been attributed to him three Latin hymns of some merit, a short monastic (or rather heremitical) rule in Celtic, and several Celtic poems, among which is a collection of his prophecies.

The strength of St. C.'s character appears to have been in its earnestness. There is no reason to think that he was reputed either wiser or more learned than the better class of the ecclesiastics of his age. But the same enthusiastic temper which won for him in boyhood the name of 'Columba of the Church,' continued to animate him throughout life.

The length and frequency of his fasts and vigils are spoken of as nearly incredible. With this asceticism he combined unwearied industry; no hour passed without its allotted duty of prayer, or reading, or transcribing, or other work. As the prevailing austerity of his disposition was often lighted up by gleams of tenderness and kindness, so it appears to have been clouded at times by anger and revenge. 'But whatever sort of person he was himself,' wrote Bede, in allusion probably to these infirmities, 'this we know of him for certain, that he left after him successors eminent for their strict continence, divine love, and exact discipline; men who follow, indeed, doubtful cycles in their computation of the great festival [i. e., Easter], because, in that far out of the world abode of theirs, none had ever communicated to them the synodal decrees relating to the paschal observance, but yet, withal, men diligently observing those works of piety and chastity,

and those only, which they were able to learn from the writings of the prophets, evangelists, and apostles.'

The ecclesiastical system of St. C. was in so far peculiar that, in the words of Bede, Iona 'had always for its ruler a presbyter abbot, to whose jurisdiction both the entire province, and the bishops themselves also, contrary to the usual order of things, must own subjection, after the example of the first teacher of theirs, who was no bishop, but a presbyter and monk.' The jurisdiction usually reserved to the episcopate was thus transferred to the abbatial office; little more being left to the bishop than the right of ordination, and a certain measure of precedence in the celebration of divine service. St. C. himself, as well as his followers generally, till the year 716, kept Easter on a different day, and shaved their heads after another fashion, than obtained in other parts of Western Christendom. But, with these exceptions, their creed and rites appear to have been substantially the same.

The life of St. C. was written by two of his successors in the abbacy of Iona—Cuimine Ailbe (657—669) and St. Adamnan (679—704). The first of these lives is incorporated in the second, which is altogether one of the most valuable works now extant on the early ecclesiastical history of Scotland and Ireland. It has gone through many editions; the last, and incomparably the best—a book, indeed, beyond praise—being that of William Reeves, D.D., printed at Dublin in 1857 for the Bannatyne Club and the Irish Archæological and Celtic Society, and included in the series of *Historians of Scotland*, published by Edmonston and Douglas. Besides his *Vita Sancti Columbæ*, Adamnan wrote *De Locis Sanctis*, an interesting account of Jerusalem and its neighborhood, from the information of a French bishop, who, in returning from the Holy Land, was driven among the Western Isles of Scotland. This tract has been more than once printed, and its chief passages were transcribed by Bede in his *Historia Ecclesiastica Gentis Anglorum*. We learn from it that waxed tablets for writing were in use among the disciples of St. C. in Iona, at the close of the 7th century.

CO'LUMBAN, or COLUMBA'NUS, ST. one of the most learned and eloquent of the many missionaries whom Ireland sent forth to the continent during the Dark Ages, was born in Leinster about the year 545. Having studied under St. Comgall, in the great monastery of Bangor, in Ulster, he passed over to France, in his 45th year, accompanied by twelve companions, and founded the monasteries of Annegray, Luxeuil, and Fontaine. His adherence to the Irish rule for calculating Easter involved him in controversy with the French bishops about 602; and a few years later, the courage with which he rebuked the vices of the Burgundian court, led to his expulsion from France. Passing through Switzerland into Lombardy, he founded in 612, the famous monastery of Bobbio, in the Apennines, where he died on the 21st November 615. His life, written, within a century after his death, by Jonas, one of his successors in the abbacy of Bobbio, has been repeatedly printed. The writings of St C., which are wholly in Latin, consist of a rule for the government of his monastery, a few poems, several letters on ecclesiastical affairs, and sixteen short sermons. His monastic rule has been printed more than once; but the most complete edition of his works is in Fleming's *Collectanea Sacra*, published at Louvaine in 1667, and now of such rarity that a copy of it sells for about £35. Of the sermons of St. C., M. Guizot remarks, that 'the flights of imagination, the pious transports, the rigorous application of principles, the warfare declared against all vain or hypocritical compromise, give to the words of the preacher that passionate authority which may not always and surely reform the soul of his hearers, but which dominates over them, and for some time at least, exercises paramount sway over their conduct and their life.' The town of San Colombano, in Lombardy, takes its name from the Irish monk, as the town and canton of St. Gall (q. v.), in Switzerland, perpetuate the name of the most favored of his disciples.

COLUMBA'RIUM (Lat.), a dove-cot or pigeon-house. When

used in the singular, C. also signified a particular kind of sepulchral-chamber used by the Romans to receive the ashes of bodies which had been burned. The name was derived from the chamber being surrounded by small niches or holes resembling the holes in a dove-cot (Columbaria) in which the urns (*ollæ*) were deposited. Tombs of this description were chiefly used by great families for depositing the ashes of their slaves and dependants. Several of them are still to be seen at Rome. The annexed woodcut (copied from Smith's *Dictionary of Greek and Roman Antiquities*) represents a very perfect one which was discovered at the Villa Rufini, about two miles beyond the Porta Pia, in 1822. In each niche were two urns, with the names of the persons whose ashes they contained inscribed over them.

COLU'MBIA, the federal district of the United States, and the seat of the general government, lies on the left bank of the Potomac, being territorially within the limits of Maryland. The district contains about 60 square miles—its chief cities being Washington, the capital of the Union, and Georgetown. Pop. (1870) 131,700; (1880) 177,638, of whom 59,402 were colored. This territory was originally 100 square miles in area, but in 1846 the county of Alexandria was incorporated with Virginia, and C. was reduced to its present size. For a long time C. was less favorably situated than the territories in regard to parliamentary representation; but now, like them, it sends one delegate to Congress.

COLUMBIA, the capital of South Carolina, U.S., is situated on the east bank of the Congaree River, about 100 miles N.W. of Charleston. It is the terminus of the navigation of the Congaree, and of three railways that connect it with Charleston and the coast. Before the civil war it was one of the handsomest cities of the southern states, but it suffered largely during the conflict, having had its principal parts destroyed by fire. It is now fast recovering from the effects of that calamity. C. is the center of a rich agricultural district, and has forests of pine, oak, walnut, and maple in its vicinity which produce a large quantity of timber. It has several educational and other institutions, including South Carolina University, founded in 1804. Pop. (1870) 9288, half of whom were colored; (1880) 10,040.

COLUMBIA, a name long applied to the region to the west of the Rocky Mountains, comprehending the present state of Oregon, the territory of Washington, and British Columbia.

COLUMBIA, or OREGON, the largest stream on the west side of America, rises in the Rocky Mountains, draining that range by means of its different head-waters, from about lat. 54° N. to about lat. 42° N. Its two main branches—the C. Proper from the north-north-east, and the Snake from the south-east—meet about lat 46° 5′ N., long. 118° 55′ W., and united, run together to long. 124° 5′ W., where they empty themselves into the Pacific in a latitude corresponding with that in which they joined. This great river, long vaguely believed to exist, was discovered only in 1792, by Captain Gray of Boston in Massachusetts, who gave it the name of his own vessel in place of the floating appellations of the Oregon and the San Roque. The extreme length is rather more than 1200 miles; most of its course—all, in fact, but the upper part of the north branch—being within the limits of the United States. Nevertheless, the entire navigation is equally open to the British and to the Americans. That navigation, however, is of comparatively little value, more particularly to the former nation.

The river is broken by falls and rapids into many separate portions; and of these, even the most important, the maritime reach, does not exceed 90 miles in length. The ingress and egress are embarrassed by a surf-beaten bar. Still, as a harbor, the C. is decidedly the best on the coast between San Francisco, which is nearly 600 miles to the south, and Port Discovery, which is fully 150 miles to the north. The extraordinarily abundant salmon-fisheries of the C. have been largely developed of late; there are near 40 canneries, mostly at Columbia, at the mouth of the river. In 1882, 535,000 cases of canned salmon were packed.

COLUMBIA COLLEGE, city of New York, founded 1754, comprises a department in arts, in law, in medicine, and in mining. The college proper has its government vested in 24 trustees. Besides a sum invested for purposes of instruction, it owns real estate and personal property to the amount of $4,200,000. In all its faculties Columbia College has over 120 professors, instructors, and assistants; and about 1500 pupils in all its schools. It possesses numerous prizes, scholarships, and fellowships. The general college library contains about 20,000 volumes. The first sum of money was obtained from an act passed by the state for raising £2250 by lottery 'for the encouragement of learning, and the founding of a college.'

COLU'MBIA, BRITISH, since 1871 a province of the Dominion of Canada, is divided into two parts—the mainland, commonly called British C.; and Vancouver's Island (q. v.). These were formerly independent colonies, but were united in 1866. The total area of the province (including Vancouver's Island and its 16,000 sq. m. of surface) is officially stated at 356,000 sq. m. The province borders on the United States and on the Canadian North-west

Territories. In 1858 the northern limit was the parallel 55° N., and the total area of British C., 120,000 sq. m. Now it extends between lat. 48° 20′ and 60° N., and long. 113°—136°. As Vancouver's Island has a separate article, and the northern section is hardly occupied, the present article is mainly concerned with the mainland sections south of 55° N. lat. Running parallel with the Rocky Mountains on the east border, which rise, in Mount Browne, to a height of 16,000 feet, two ranges divide the width of the country into three sections of drainage. In the east are headwaters, which find opposite outlets in the estuaries of the Columbia and of the Mackenzie; through the entire middle and part of the east, the Fraser maintains a southerly course, till, at Fort Hope, it is bent sharply to the right by a mountain barrier, so as to enter the Gulf of Georgia barely within the international boundary;* and lastly, across the west, a series of streams generally meeting long and narrow inlets of the ocean, and terminating in the Skeena, which, with its upland reservoir, Babine Lake, of 100 miles in length, is but little inferior to the Fraser itself.

The principal harbors are Burrard Inlet, on the Gulf of Georgia, a few miles from New Westminster, and the chief port for the lumber trade; Howe Sound, north of Burrard Inlet; Bute Inlet, still farther north; Millbank Sound, which will become valuable as the gold mines on the Peace River attract a population; the river Skeena, now ascended by steam-vessels, and one of the routes to the Ominica gold mines; and the river Nass, near the frontier of Alaska, watering a region also believed to be rich in gold.

The interior of British C., i. e., the region between the Cascade Range and the Rocky Mountains, is, on the whole, rugged and lofty, and though rivers are numerous, they do not serve the purposes of irrigation, being often confined within deep ravines. Still the tracts of arable land are of considerable extent, and very fertile. In 1872, some land 1700 feet above the sea-level, yielded, under proper irrigation, 40 bushels of wheat per acre. The pastures of British C. are, however, likely to prove much more valuable than its arable ground. They are almost endless in extent. On the Cariboo road (between Soda Creek and Quesnel), there is a plain 150 miles long, and 60 or 80 wide; and between the Thompson and Fraser rivers there is an immense tract of grazing land. The hills and plains are covered with bunch grass, on which the cattle and horses live all winter, and its nutritive qualities are said to exceed the celebrated blue grass and clover of Virginia.

The forest lands are also of vast extent, and yield most valuable timber. The principal trees are the Douglas pine, Menzies fir, yellow fir, balsam hemlock, white pine, yellow pine, cedar, yellow cypress, arbor vitæ, yew, oak, white maple, arbutus, alder, dogwood, aspen, cherry, willow, and cottonwood. The Douglas pine is almost universal on the sea-coast and up to the Cascade range. The cedar, white pine, and maple are found everywhere; the Scotch fir, the willow, and cotton-wood on the bottom-lands. But the lumber-trade is only beginning; the value of the exports, in 1870, amounting to little more than £25,000. The Fraser river and its tributaries, with the numerous lakes communicating with them, furnish great facilities for the conveyance of timber. The Lower Fraser country especially is densely wooded. Smaller streams and the numerous inlets and arms of the sea do the same thing for the region further north.

The *fisheries* of British C. are perhaps the richest in the world, but their distance from populous centers has hitherto prevented their development. Whales and seals abound off the northern coasts. Sturgeon are plentiful in the rivers and estuaries; they are found weighing over 500 lbs., and are easily caught. The salmon of the Fraser River are famous over the American continent; so are the oulachans, small sprat-like fish, which enter the river in millions; some are so full of oil that, it is said, they will burn like a candle. Cod, herring, halibut, anchovies, haddock, &c., are caught in great quantities.

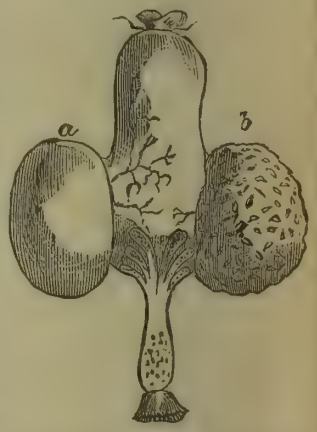
The attractiveness of mining acts as a hindrance to the regular development of the other resources of the province. Copper, lead, cobalt, talc, platinum, cinnabar, and agate occur in British C.; silver has been obtained in considerable quantities. Gold may be said to be universally diffused. New mines were opened in 1871, in the north, in the Peace and Ominica district, and yielded in the same year over £80,000. The total yield for the province in 1875 was about £500,000, and the total yield from 1857 has been estimated at about £7,000,000. The only obstacles to the prosecution of almost inexhaustible gold-mining are the want of roads, the want of capital, and the want of a thorough geological survey. Silver mines have been opened in the Fraser Valley. Coal and iron are also found. Furs are one of the most important products of the country, the value of the exports of that article in 1874 being upwards of £60,000. The most valuable are the black and silver fox, sea otter, red fox, fur seal, mink, martin, beaver, and common otter. Buffalo are found on the plains; bears, and goats, and sheep on the mountains; elk are met with on the coast, and deer on the groups of small islands; wild ducks and geese are abundant; grouse and snipe are found everywhere; and in the plains a kind of tall buff crane, 4 or 5 feet high.

The *climate* varies according to the locality, owing principally to four causes: (1) greater or less distance from the sea; (2) or from the mountain regions; (3) difference in the variety and growth of vegetation; (4) difference of level. The low portions near the sea and on Vancouver's Island have a moderate climate, with a temperature ranging from 20° in winter to 80° in summer. The spring is short, lasting from the beginning of March to the early part of May. A short spring lasts from March till May; summer, from May till September; the next two months are autumn, of which winter is only an aggravation, the snows being light, and the frosts far from severe or lasting.

To its mineral resources, British C. mainly owes its present position. It was the discovery of gold in 1857—coinciding as it did with the expiration of the Hudson's Bay Company's licensed monopoly—that led to the establishment of the colony in 1858. In connection with this same cause, adventurers from the United States, from Great Britain and its dependencies, and from China, have flocked hither. According to the census of 1871, the population of the province was 10,586, exclusive of Indians, who are estimated at from 30,000 to 50,000, but their numbers are diminishing from small-pox, measles, and tribal wars. The census of 1881 showed a total of 49,459. The capital of the province is Victoria (q. v.), on Vancouver's Island (pop. in 1881, 5925); and the chief town on the mainland, New Westminister (4003). During the three years 1879 to 1881, the value of the exports of the province varied from $2,250,000 to $2,750,000, while the value of imports ranged from $2,290,000 to $2,440,000. When the Canadian Pacific Railway is completed, this province will become one of the most valuable in the Dominion. The different routes proposed have provoked much local contention. In the scheme submitted to the Dominion Parliament in 1880, and now being steadily carried out, the completion of the railway within ten years was contemplated.

British C. is represented in the Canadian parliament by 3 senators and 6 members of the House of Commons; but it has also a local legislature, a lieut.-governor, and an executive council. The chief towns are Victoria and New Westminster.

COLU'MBIDÆ, a family of birds, often comprehended under the general English names *dove* and *pigeon*, and forming the genus *Columba* (Lat. pigeon) of Linnæus. They are generally ranked among gallinaceous birds, but exhibit points of resemblance to the order *Insessores*, and have by some naturalists been constituted into a distinct order, intermediate between these. They agree with the true gallinaceous birds in the character of their bill, and in the soft naked tumid membrane at the base of it, in which the nostrils are pierced; also in their *rasorial* (scraping) habits and blunt claws; but they differ very widely from them in their great powers of flight, which are not surpassed in any other family of birds; in having the hind-toe on the same level with the other toes; in having no connecting membrane at the base of the toes; in not being polygamous but pairing, and in the male taking part with the female in the care of the young; in their having generally only two young ones at a time, but breeding often in a year; in their double crop, an expansion of the gullet on both sides, in which they differ from all other birds; and in the secretion, at breeding-time, of a milky fluid by the crop of both parents, as in the parrots, with which the food is saturated in order to fit it for the young, which, unlike those of the true gallinaceous birds, are at first very helpless. The figure represents the gullet and double crop of a pigeon—one side, *a*, exhibiting the usual appearance of the crop; and the other, *b*, showing its appearance when the glands are developed which secrete the milky fluid. The number of species of C. is very great. There is amongst them so much resemblance, that scientific classification has been found very difficult. They are found in all warm and temperate climates, but comparatively few are European. The Indian archipelago particularly abounds in them. Many of the tropical species exhibit a brilliancy of colors scarcely excelled in the humming-birds or sun-birds.



Gullet and Double Crop of a Pigeon.

The chaste beauty of the plumage is always pleasing, even

* The decision of the German emperor (21st October 1872) on the *San Juan Boundary Question*, has affirmed the accuracy of the American interpretation of the treaty of 1846, in virtue of which the boundary of the United States runs through the Haro Channel, and the San Juan archipelago, lying between Vancouver's Island and the mainland, and commanding the outlet to the Pacific, has been assigned to the latter power.

when brilliancy is wanting. The voice is very similar in all the species, the *cooing* of some, however, being harsh, that of others soft and pleasant. Some species are migratory, and some congregate in prodigious flocks. See BRONZEWING, CARRIER PIGEON, DOVE, FRUIT PIGEON, GOURA, GROUND-DOVE, PARTRIDGE PIGEON, PASSENGER PIGEON, PIGEON, TURTLE-DOVE, and VINAGO.

CO'LUMBINE (*Aquilegia*) a genus of plants of the natural order *Ranunculaceæ*, having five colored sepals, which soon fall off, and five petals each terminating below in a horn-shaped spur or nectary. They are natives of the temperate and colder regions of the northern hemisphere. One, the Common C. (*A. vulgaris*), is found in woods in some parts of Britain, and has long been familiar as an inmate of flower-gardens. It is a perennial, generally three or four feet high, with flowers of curious structure and considerable beauty. C. was formerly much esteemed for medicinal virtues, which are now seldom heard of.—Some of the other species are very ornamental, and are pretty common in flower-borders.

Common Columbine (*A. vulgaris*).

COLU'MBIUM, or TA'NTALUM (symbol Ta), is a rare metal found in the mineral tantalite, obtained from Bodenmais, in Bohemia, and from Sweden. It can be obtained as a black powder, which assumes a lustrous aspect when subjected to the process of burnishing. It forms a series of compounds, of which only Columbic Acid (TaO_3) is worthy of notice.

COLU'MBUS, CHRISTOPHER (the Latinized form of the Italian *Colombo*, and the Spanish *Colon*), the great navigator, who added a new hemisphere to our globe, is supposed to have been born at or near Genoa, in the year 1436, or, as others say, 1446. Though virtually the greatest man of his era, there is little definite information about his family and his early life. It would appear, however, that he was the son of a wool-comber; that he attended for some little time the then great school of learning at Pavia, where he evinced a taste for astronomy and cosmography; and that he early went to sea, and made several voyages in the Mediterranean.

Settling in Lisbon in 1470, he there married the daughter of an Italian named Palestrello, who had distinguished himself as a navigator in the Portuguese service, and with her obtained some valuable charts, journals, and memoranda. Lisbon, at this time, was the headquarters of all that was speculative and adventurous in the way of geographical discovery; and here, while constructing maps and charts for the livelihood of his family, C. first appears to have imbibed that idea of land to the westward, which he was destined, after long disheartening years, to establish as fact—the land, indeed, not being, as he had supposed it, a prolongation of the eastern shores of Asia, but a new western continent. With the view, apparently, of better qualifying himself for his great enterprise, C. made several voyages to the Azores, the Canaries, and the coast of Guinea—then the limit of European navigation in this direction. Not until about 1482 or 1483, did C. find opportunity to lay his scheme before John II. of Portugal. This monarch referred it to a junto of nautical and scientific men, who decided against it. The king, however, meanly taking advantage of a detailed plan obtained from C. under false pretences, secretly sent out a vessel to examine the route. Too timid to venture far from the beaten-track, the pilots soon returned to Lisbon, to throw ridicule on the project. Disgusted with the duplicity of his sovereign, C. secretly left Lisbon in 1484, taking with him his little motherless boy Diego. He found his way to Genoa, where the republic, before whom he unfolded his scheme, treated it as the silly product of a visionary brain; and it is said that he also met with like treatment from the Venetians; but it appears doubtful whether he at this time communicated with them. Disappointed, but not despairing, for C. was buoyed up with the belief that Heaven had commissioned him to plant the banner of the cross upon those shores which as yet appeared to exist but in his own imagination, C. turned his steps towards Spain. Weary and hungry, he stopped one day at the gate of the Franciscan convent La Rabida, in Andalusia, to beg some bread and water for his child. This day was the turning-point in his career. The superior of the convent, Juan Perez de Marchena, passing at the moment, entered into conversation with the traveler, and was so struck with the grandeur of his views, that he used all his influence to procure him the favorable consideration of the king and queen. It was not, however, until seven more years of disappointments had passed over—during which C. had applied to other courts, and without avail—that he found himself in command of three small vessels, only one of which was decked, with 120 men, ready to start on his adventurous enterprise.

C. claimed, as reward, to be nominated high-admiral, and governor-general and viceroy, over all the lands he discovered, with a tenth of the produce of the countries. On the 3d of August, 1492, C. set sail from the bar of Saltes, near Palos. Delaying a month at the Canaries to refit, he started thence, on the 6th of September, over unknown seas. His crew soon began to interpose their timid fears, and when these were unavailing, to express their open disaffection; but equally disregardful of both, C. bore steadily westward; himself, however, not without misgiving as to what the variation in the needle (not before discovered) portended. On the 12th of October, his perseverance was rewarded with the sight of land, which proved to be one of the Bahama Islands. Here he solemnly planted the cross, giving the island the name of San Salvador. After discovering several other of the West India Islands, including Cuba and Hayti, or San Domingo, at the latter of which, called by him Hispaniola, he settled a small colony, C. set sail again for Spain, where he arrived on the 15th March, 1493, and was received with every demonstration of joy and admiration, as well by the people as the court. In September of the same year, he set sail from Cadiz on a second expedition, with 17 ships and 1500 men. In this voyage, he discovered the Caribee Islands, Jamaica, &c.; but calumnies at home forced him to return in 1496. Having cleared himself with his sovereigns, he, in 1498, set out on a third expedition. This time, steering more to the southward, he discovered Trinidad, and the mouths of the Orinoco, and landed at Paria, on the coast of South America. After these discoveries, C. steered for Hispaniola, where he found everything in disorder. The king's ear had been again abused; an officer named Bovadilla had been appointed to supersede C. as governor, and by this person C. was sent home in chains. This unworthy treatment excited the indignation of the Spanish people to such a degree, that Ferdinand was fain to disavow all knowledge of the disgraceful affair. But all C.'s efforts to obtain redress from the king were fruitless. The spirit of adventure, however, which had borne him up amid so many disappointments, was not to be crushed by injustice. It still burned bright and strong as ever within the great old man, who, on the 9th May, 1502, with four vessels and 150 men, set out once more to seek a passage uniting the Atlantic and Pacific oceans, which he imagined lay somewhere between Honduras and Paria. But the mutinous character of his crew forced him aside to seek for gold, and after many difficulties and disasters, and having added little of importance to his previous discoveries, he returned to Spain in November, 1504. Isabella was dead; Ferdinand proved basely ungrateful; and so the noblest navigator the world has seen, was permitted to die in poverty at Valladolid, 20th May, 1506. To make up somewhat for his injustice, Ferdinand gave C. a pompous funeral, and erected a magnificent monument to his memory. The bodies of C. and his son were carried in 1536 to San Domingo, and in 1796 were transferred to the cathedral of Havana, where they still repose.

COLUMBUS, capital of Ohio, U.S.A., stands near the center of the state, 100 miles N.E. of Cincinnati. The chief public institutions of the state are situated here—the capitol, the penitentiary, the state arsenal, and the asylums. The manufactures are important, their being numerous machine shops, foundries, breweries, and carriage works. Pop. (1870) 31,274; (1880) 51,665.

COLUMBUS, a city of Georgia, U.S.A., stands on the Chattahoochee River, 300 miles from the mouth, and has some trade. Pop. (1880) 6152.

COLUME'LLA.—1. The central axis which remains, formed of the placentas, when the carpels of some fruits have separated from each other and from them.—2. The central axis of the spore-cases (capsules) of mosses.—3. The central axis around which the whorls of many spiral univalve shells are closely wound.

COLUMELLA, LUCIUS JUNIUS MODERATUS, the most learned of Roman writers on practical agriculture, was born at Cadiz, in Spain, and flourished in the earlier part of the 1st c. of the Christian era. For some time he resided in Syria, but lived chiefly at Rome, and died, most probably, at Tarentum. His great work, *De Re Rustica*, in 12 books—the 10th, On Gardening, is versified—is addressed to one Publius Silvinus, and treats of arable and pasture lands, culture of vines, olives, &c., care of domestic animals, &c., respective duties of masters and servants, &c. A supplementary treatise relates to trees. This ancient 'Book of the Farm' is written in good Latin, and the information is copious, though not precise, and in some points of questionable accuracy. The best editions of C. are by Gesner (1735 and 1773) and Schneider (1794—1797).

CO'LUMN (Lat. *columna*), a pillar or post, usually cylindrical in form, employed for the purpose of supporting a roof, entablature, or other superstructure. As the earliest habitations in almost all countries were formed of wood, it is unquestionable that the earliest columns consisted of the trunks of trees. It is said that even at the present day the Greek peasants of Asia Minor construct their wood-huts so as almost exactly to resemble the form and disposition of parts which we find in the great architectural monuments of classical antiquity. That the Greeks actually made use of wood in the earliest time, even for their monumental structures, we learn on the testimony of Pausanius, who mentions a monument in the market-place at Elis which consisted of a roof supported by pillars of oak; and Pliny tells us that the temple of Juno at Metapontum was supported by pillars made of the stems of vines. From these facts, it is natural to conclude that the stone columns which came first into use would be imitations of the trunks of trees; and this we are also in a condition to prove historically, many of the largest stone columns in Egypt—where, from the scarcity of wood, they were earlier introduced than elsewhere—being manifest imitations of the trunk of the palm (figs. 2 and 3).

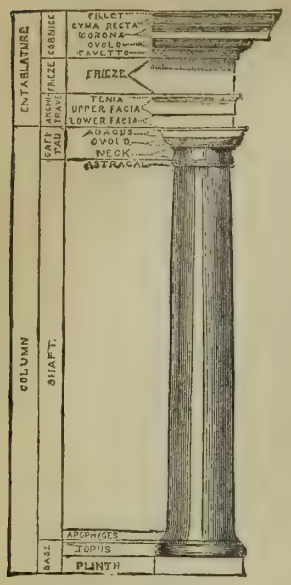


Fig. 1.—Column: Tuscan, with details.

In order to prevent them from being forced into the ground by the superincumbent weight, these early wooden columns were placed upon one or more large flat stones, and on the top another stone was placed, to preserve them from the decay which the rain sinking into the wood would have occasioned. In these primitive arrangements, we plainly perceive the germ of the three principal parts of the classical C.—the shaft, the base, and the capital. As the Doric style of architecture was the earliest of the classical styles, the Doric is naturally the simplest and most severe of the classical columns. One of its most striking peculiarities is what at first sight seems to be the absence of the base (fig. 4). The true account of the matter, however, is, that all the columns in the same line of a Doric temple stand on one base, whereas, in the other orders, each C. has a separate base. But it is in the capitals in all the orders, Egyptian, Classical, and Gothic, that columns differ from each other most strikingly (see below). As classical architecture advanced, greater lightness and elegance were sought after; and this, as regarded the C., was obtained by increasing the height, and diminishing the proportional thickness of the shaft. In the Ionic and Corinthian orders (figs. 5 and 6), as compared with the Doric, this peculiarity may be distinctly seen.

Fig. 2.

Fig. 3.

In almost all columns, the shaft tapers gradually from the bottom to the top, thus imitating the natural growth of a tree, and at the same time conforming to a mechanical rule for obtaining the greatest amount of strength in upright bodies. But in place of tapering regularly, the shaft was generally made with a slight swelling towards the middle, called the *entasis*, and had for the most part in all the classical orders striped incisions from top to bottom called flutes or channels, which were regularly worked, and varied in number from 20 to 32. See FLUTING. The relation which subsisted between the height of the C., and the diameter at the top and bottom, and between these and the entablature, has been calculated with the greatest possible precision in all the principal classical examples, and will be found stated in all professional works on classical architecture. The shaft usually consisted of several cylindrical blocks accurately fitted to one another, whilst the capital was commonly hewn out of a single stone. The separate portions of the shaft were fixed together, not by mortar or cement, but by iron cramps, which were fitted into holes in the center, and thus rendered invisible. Sometimes columns of immense size were hewn in the quarry of one piece of stone, and then rolled over the ground, and raised to their destined positions by various mechanical contrivances. Columns were often used in classical times, and are employed by us in the interior of buildings to support the roof or galleries, as well as for purposes of decoration; and this custom seems to have prevailed in the halls of persons of great distinction even in Homeric times.

In the ancient Basilica (q. v.), a line of columns separated the central space which was open to the sky from the aisles of the building, whilst at the same time they supported the galleries which were placed above the aisles. These columns were the origin of the piers or pillars by which the nave is divided from the aisles in Christian churches. The same arrangement prevailed in the Roman atrium. When, in order to support the roof which covered the gallery or any other superstructure, a second row of columns was introduced, it was usually of the lighter styles, Ionic or Corinthian, the lower columns being commonly Doric. Single columns were erected for various purposes, as for mooring ships

Fig. 4.

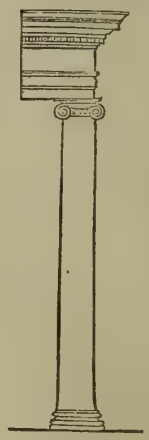

Fig. 5.

Fig. 6.

in harbors, or to commemorate persons of note, or national events. See PILLAR.

Capitals.—In classical architecture, it is by the capitals of pillars, more than by any other feature, that the different orders are distinguished, very much as the Gothic styles are marked by the form of the arch. Till the period of the renaissance, the head of a column, in English, was called chapiter (chapter), its diminutive being chapitrell. The three capitals which alone belong to pure Greek architecture are described in Thomson's well known lines (*Liberty*), so concisely and accurately, that it is needless to dwell on them in prose:

> 'First unadorned,
> And nobly plain, the manly Doric rose;
> The Ionic then, with decent matron grace,
> Her airy pillar heaved; luxuriant last,
> The rich Corinthian spread her wanton wreath.'

To the three Greek orders, the Romans added two others: the Tuscan, which was a variation on the Doric, or rather a corruption of it; and the Composite, which was a combination of the Ionic and Corinthian, the proportions and general character of the Corinthian being retained, but the Ionic volutes being substituted for the Corinthian leafage. As the trunks of trees placed upright, so as to support the roof, unquestionably led to the introduction of the stone pillar, there seems to be almost as little doubt that the capital was suggested by the boughs with which such trees might be supposed to be surmounted, or the garlands with which, on festive occasions, they were probably encircled and crowned. At first, when the power of working in stone was limited, imitation of foliage was scarcely attempted; but the original idea being adhered to, it came at last to be carried out with great success in the Ionic and Corinthian capitals of classical architecture, and in all of the more advanced of the Gothic styles.

Fig. 7.

The forms of Gothic capitals are so various, that it is altogether impossible to particularize them here. Beginning with the Romanic—which is often nothing more than a modification of the Doric, or a further debasement of the Tuscan, the sides being truncated or flattened, and some of the mouldings omitted—they advance very rapidly in adornment; and in the style which we call Early English, they already frequently consist of a mass of foliage, cut with great boldness and freedom, so that the stalks and more prominent of the leafage are entirely detached. It is remarkable that, in the decorated style, the capital lost much of the richness which it possessed in the earlier styles, and often consists only of plain mouldings, with or without a ballflower (q. v.), cut on the bell or bowl of the capital. Where foliation is introduced into this style, it is usually worked with greater freedom, and is free from the

stiffness which characterizes earlier work. Animals, figures in armor, heads of bishops in mitres, and the like, are oftener found in the decorated style, though their introduction was not unknown at a much earlier period. In the perpendicular style, the capitals were stiffer in form, and generally less ornamented than in any of the others; though even here foliage is often introduced, as in the accompanying example from the cloisters of Christ Church, Oxford.

The only invariable characteristics of capitals seem to be something like a moulding at the upper part of the shaft, more or less complicated according to circumstances, and some sort of Abacus (q. v.), or flat portion on the top, on which the architrave rested in the classical orders. These characters belong even to the Egyptian capitals, which in many other respects resemble those of the other styles. The foliation of Egyptian capitals is generally taken from the vegetation peculiar to the banks of the Nile (fig. 2); but the capitals of this, particulary in its later examples, were infinitely varied both in decoration and in form.

COLUMN, in Military Evolutions, is a mass of soldiers several ranks in depth, presenting a formation different from that which arises from spreading them out *in line*. There may be columns of brigades, of regiments, of battalions, or of companies; presenting a front of limited width, but a width depending on the number of elements in the column. If a battalion consists of ten companies, then a 'battalion in C.' has all the companies posted one behind another.

According to the density of the C., it is called *open* or *close*. In a battalion, when the distance between any one company and the one immediately before it is such as to admit of their wheeling into line, the formation is called *open* C.; when the distance between the front rank of one company and the rear rank of the one before it is only a few yards, it is *close* C.; when intermediate between these two, it is *half-distance* column. The relative advantages of C. and *line*, in drawing up troops for action, are among the matters closely studied by the commanders of armies: the French, as a general rule, have rather favored the formation in C.; the English, that in line. Sometimes the name C. is given to that which, in effect, is a small army.

CO'LURE. See ARMILLARY SPHERE.

COLU'TEA. See SENNA.

COLY'MBIDÆ, a family of web-footed birds, distinguished by short wings, legs placed so far back that the bird always assumes an erect position when standing, broad flat tarsi (*shanks*), and a compressed bill, pointed at the tip. They are all extremely aquatic in their habits, and possess great powers of diving as well as of swimming. Some of them have all the front toes perfectly webbed, as the loons or divers, (*Colymbus*); others have the feet lobed, each toe with a separate membrane, as the grebes (*Podiceps*). These are the two principal genera. The guillemots (*Uria*) seem to connect this family with the *Alcadæ*.

CO'LZA. See RAPE.

CO'MA, a Greek word used in medicine, to signify a state of more or less profound insensibility allied to sleep, but differing from natural sleep in its characters, as well as in the circumstances under which it occurs. In C., the patient lies on his back, and is either simply insensible to external impressions, or has a confused and dull perception of them, with restlessness and low Delirium (q. v.). The former kind of C. occurs in appoplexy and epilepsy, and also in many other organic diseases of the brain and its membranes, of which, indeed, it may be said to be the natural termination. It is also seen in narcotic poisoning, and most characteristically in poisoning by Opium (q. v.). In the most fatal forms, the breathing is very slow and noisy (snoring or stertorous), accompanied with puffing of the cheeks; the pulse is at first strong and regular, afterwards feeble; there is often lividity; and the pupils are either contracted or excessively dilated, but in either case immovable, and totally insensible to light. In the second variety of C., there is perpetual restless delirium, without enough of sensibility to lead to spontaneous and regular voluntary movements; the patient mutters slightly, and grasps feebly and without purpose at any object in his way; the pupils are commonly contracted, and the tongue is apt to be dry and brown. This kind of C. is mainly seen in many fevers, and forms one of the modes of their fatal termination. The treatment of C. is that of the disease or accident leading to it.

Where there is a reasonable chance of recovery, the patient must be roused to consciousness as much as possible, either by frequent movements or strong impressions on the skin, or by the use of galvanism, so as to maintain the respiration. See OPIUM. Blistering of the head is also sometimes resorted to with good effect.

CO'MA BERENI'CES (Lat. Berenice's hair), a small and close cluster of stars near the equinoctial colure, south of the tail of the Great Bear.

COMA'CCHIO, a fortified town of Central Italy, in the province of Ferrara, and 3 miles from the Adriatic. The lagoon or marsh, in the midst of which it is situated, is about 140 miles in circumference, and is shut out from the Adriatic by a narrow belt of mud. Its position is very favorable for the manufacture of salt, of which 2,000,000 lbs. are said to be obtained annually. C. is also the seat of a curious branch of industry—viz., eel culture, which forms the principal employment of its inhabitants, who number about 8000. A series of canals have been constructed leading from the Adriatic to admit the fry of the eel, the mullet, the sole, and other fishes into the lagoon, where they are fattened, and speedily attain a marketable value. The fishery is carried on chiefly in the late autumn, when the waters of the lagoon are excited by storms. The fish, then seeking an outlet to the sea, find their way into certain labyrinths leading into reservoirs constructed at the termination of the canals, where they are caught in immense quantities. Religious ceremonies inaugurate the commencement of the season, and when any body of fishermen in one night capture 48,000 lbs., weight of fish, a feast of fish is held, and great rejoicings take place. The eel-harvest occupies from twelve to fifteen weeks; and some idea of its extent may be formed from the fact, that from the years 1798 to 1813 the annual 'take' averaged close upon 2,000,000 lbs. weight. From 1813 to 1825, the average was about 1,612,600 lbs. per annum. An accident for some years greatly reduced these quantities, but the supply is greatly increasing, being upwards of a million pounds weight per annum. The fish are prepared for the market by partial cooking in a large kitchen built for the purpose, the eels of moderate size being roasted alive, in order to their better preservation. The larger fish are chopped into lengths, the heads and tails being sold for the benefit of the poor. Large quantities of the eels are also salted and dried. The workmen, who are lodged in barracks, and submit to a strict discipline, are allowed one and a half pounds of fish per diem. The money-value of these fisheries may be estimated from the fact, that 1 lb. weight of eel-fry will, in the course of three or four years, be worth to the cultivators of the lagoon a sum of £41 sterling.

COMA'TULA. See CRINOIDEÆ.

COMAYA'GUA (formerly VALLADOLID LA NUEVA), chief city of Honduras, Central America, 190 miles east of Guatemala, in a fine but unhealthy valley, 1800 feet above the sea, on the right bank of the Humuva, which flows into the Pacific. The city was founded in 1540, is the see of a bishop, has a cathedral, college, ecclesiastical seminary, several convents, and a rich hospital. Pop. 8000; it was 18,000 previous to 1827, when the city was burned by the monarchical faction of Guatemala, and has never since wholly recovered.

COMB (Sax. *camb*). Combs seem to have been used by the ancients rather for adjusting than for fastening the hair, the pin or bodkin (*acus*) having been chiefly employed for the latter purpose. Both the Greek and Roman combs were generally made of box-wood, which was obtained from the shores of the Euxine; but latterly ivory combs came into general use amongst the Romans, as they had long before been amongst the Egyptians. The precious metals were also used for the purpose, as we may infer from the golden combs ascribed to the goddesses; but this was probably rarer in ancient than in modern and medieval times, from the circumstance of the C. not having been then used as an ornamental fastening. Of the early use of gold combs by our own countrywomen, we have a monument in the well-known ballad of *Sir Patrick Spens*:

'O lang, lang may their ladyes sit,
Wi' their gowd kames in their hair.'

Fig. 1 represents an ancient Irish long rack C. in the museum of the Royal Irish Academy. The sides are hog-backed, and between them are set pectinated portions, varying in breadth from

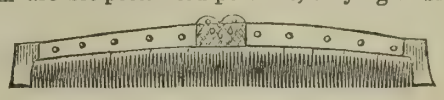

Fig. 1.

half an inch to an inch and a quarter, according to the size of the bone out of which they were cut. The whole is fastened together with brass pins riveted. By this contrivance, any damaged portion could easily be replaced.

Fig. 2 is a specimen of a pocket fine-tooth C., from the same collection; it is drawn two-thirds the size of the original.

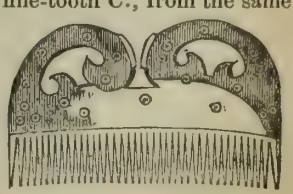

Fig. 2.

Combs are made of tortoise-shell, ivory, horn, wood, bone, metal and india-rubber. The material is first made into plates of the size, shape, and thickness of the C., and then the teeth are cut. The old method of cutting the teeth is by the *stadda* or double saw, which has two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended

tooth. Combs with 50 or 60 teeth to the inch may be cut in this manner. The teeth are then thinned, smoothed, and finished by means of thin wedge-shaped files. Instead of hand-saws, circular-saws of similar construction have been more recently used.

Many combs are now made by a method called 'parting.' By the processes of cutting above described, the material corresponding to the spaces between the teeth is of course wasted; by the method of parting, this is made available to form the teeth of a second comb. The annexed figure will show how this may be effected. The plate of horn, tortoise-shell, &c., is cut through by means of a stamping-cutter, consisting of two thin chisels inclined to each other, as *ac* and *bd*, which represent their edges; between these, and connecting the ends *c*, *d*, is a small cross-chisel. When

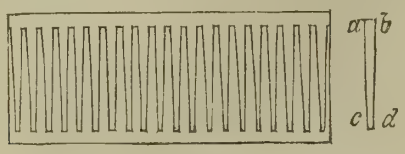

Fig. 3.

this compound cutter descends with sufficient force upon the plate, it will cut one of the teeth shown in the figure. By simple machinery, the table carrying the plate is made to advance a distance equal to the thickness of one tooth while the cutter is rising, and thus the successive cuts are made as represented. A slight pull is now sufficient to part the plate into two combs, the teeth of which only require filing and finishing.

India-rubber combs, now so extensively used, are manufactured by pressing the caoutchouc to the required form in moulds, and 'vulcanizing' or combining it with sulphur afterwards. By this means a high degree of hardness can be obtained.

COMB, or COOMB, an old corn-measure, containing four bushels. In many localities, hollows or valleys among hills are called COMBS or COOMBS (W. *cwm*). The word is allied to the Gr. *kymbos*, a cavity; *kymbe*, a vessel.

COMBE, GEORGE, a well known phrenologist and moral philosopher, was born October 21, 1788, in Edinburgh, where he was educated. Entering the legal profession, he became a writer to the Signet in 1812, and continued to practise until 1837, when he resolved to devote himself to scientific pursuits, for which he had always manifested a predilection. As early as 1816, he made the acquaintance of Dr. Spurzheim, while the latter was on a visit to Scotland, but at first regarded his phrenological system with aversion. Investigation, however, convinced him that phrenology was based on fact. The result was his *Essays on Phrenology* (1819). Five years latter appeared his *System of Phrenology*, which became very popular, and reached a fifth edition in 1843; besides being reprinted in America, and translated into French and German.

But his most important production is *The Constitution of Man considered in Relation to External Objects* (1828; 9th ed. 1860). This work endeavors to demonstrate, what it is strange should ever have been denied, the essential harmony of the nature of man with the surrounding world, and the necessity of studying the laws of nature, in order that we may realize the advantages of the external world, lessen our exposure to outward evils, and carry out successfully man's physical, moral, and social improvement. C.'s doctrines were violently opposed, being considered by many as inimical to revealed religion: but now that the heat of controversy has cooled, it is seen that, in their main aspects, they were not liable to the objections urged; and they are, to a large extent, adopted in the physico-social reforms of the present day. Nearly 100,000 copies of the work have been sold in this country; numerous editions have been printed also in America, and it has been translated into French, German, and Swedish. C. contributed largely to the *Phrenological Journal* (20 vols. 1824—1847). He traveled in Germany and America, and published *Notes* of his experiences. His death occurred on 14th August 1858. Mr. C. married, in 1833, Cecilia, daughter of the celebrated Mrs. Siddons; by whom he was survived. Besides the works mentioned, he wrote *Elements of Phrenology* (1824; 9th ed. 1862); *Lectures on Popular Education* (1833; 3d ed. 1848); *Moral Philosophy* (1840; 3d ed. 1846); *Life and Correspondence of Andrew Combe, M.D.* (1850); *Principles of Criminal Legislation and Prison Discipline* (1854); *Phrenology applied to Painting and Sculpture* (1855); and *The Currency Question considered in Relation to the Bank Restriction Act, 7 and 8 Vict. c.* 32 (1855; 8th ed. 1858), &c. The latest of his works—in which the importance of natural religion, and the duty and advantage of obedience to its precepts, are eloquently enforced—is on *The Relation between Science and Religion* (1857). Endowed with great activity and an earnest apostolic spirit, C. was fond of lecturing on his favorite subjects, and delivered many successful courses not only in various parts of the United Kingdom, but in the United States, and even in Germany. As a citizen, he took a zealous part in promoting parliamentary reform, the abolition of the corn laws, and a system of national education. His books on phrenology were given to the Advocates' Library. See the *Life* by C. Gibbon (1878); and C.'s views and articles on *Education*, collected by Jolly (1879).

COMBE, ANDREW, M.D., brother of the preceding, was born in Edinburgh, October 27, 1797. He studied medicine there and at Paris, and in 1823 commenced to practise in his native city. In 1836 he received the appointment of physician in ordinary to the king of the Belgians, but his delicate health prevented him from retaining this office; and on returning from Brussels, he continued to act only as consulting-physician to his majesty. Afterwards, he became one of the physicians in ordinary to Queen Victoria in Scotland. He died at Edinburgh, August 9, 1847. His principal works are—*Observations on Mental Derangement* (1831); *The Principles of Physiology applied to the Preservation of Health*, &c., (1834; 15th ed. 1860); *The Physiology of Digestion considered with Relation to the Principles of Dietetics* (1836; 10th ed. 1860); and *The Management of Infancy, Physiological and Moral* (1840; 9th ed. 1860, revised by Sir James Clark; 10th ed. 1870). Mild, benevolent, and wise, Andrew C. obtained the esteem and admiration of all who could appreciate purity and excellence of character. In his *Life and Correspondence*, published by George Combe in 1850, we find not only a vivid picture of the man, but an example of patient adherence to physiological principles in the treatment of a delicate constitution, with the result of prolonging a useful life far beyond what he had ventured to hope for. The record of the means by which he combated a serious pulmonary disease for nearly thirty years at home and abroad, is calculated to be highly instructive to persons similarly afflicted. His death was probably hastened by exposure to the poisonous air of an emigrant ship, in which he made a voyage to America: the experience gained on this occasion led him to proclaim, through the *Times*, the urgent necessity of a law regulating the sanitary arrangements in emigrant vessels. The long letter which he wrote on this subject appeared on September 17, 1847, a month after his death, and ere long the Act 12 and 13 Vict. c. 23, provided a remedy for the evil. Dr. C. also exerted himself successfully for the improvement of medical education. A list of his contributions to the *Phrenological Journal* and the *British and Foreign Medical Review* is appended to his *Life*. His character as a man, a physician, and a writer, is affectionately depicted by his friend Sir James Clark, in an Introduction to the 9th edition of *The Management of Infancy*.

CO'MBERMERE VISCOUNT (Stapleton Stapleton-Cotton), a British field-marshal, son of Sir Robert Salusbury Cotton, baronet, of Combermere Abbey, Cheshire, was born in 1773 at Llewenny Hall, Denbighshire. Educated at Westminster School, he, in February 1790, entered the army, and distinguished himself in India at the battle of Mallavelly and the siege of Seringapatam. In 1807—in which year he succeeded his father in the baronetcy—he proceeded, with the rank of major-general, to the Peninsula, in command of a brigade of cavalry; and in 1810 was appointed to the command of the whole allied cavalry under the Duke of Wellington.

He was present at the battles of Talavera, Fuentes de Onoro, Salamanca—where he was second in command, and was severely wounded—the Pyrenees, Orthes, and Toulouse. For his brilliant services in the Peninsular War, he repeatedly received the thanks of parliament, and in May 17, 1814, was raised to the peerage as Baron Combermere. Although not at Waterloo, he had the command of the cavalry of the army of occupation in France; and in 1817 was appointed governor of Barbadoes, and commander of the forces in the West Indies. In 1822, he became commander-in-chief in Ireland; and in 1825 was nominated commander of the forces in India. In that position, he achieved the capture of the strong and almost impregnable fortress of Bhurtpore; and, December 2, 1826, was raised to the rank of viscount. In 1834, he was sworn a privy councillor; and in October 1852 succeeded the Duke of Wellington as Constable of the Tower of London and Lord-Lieutenant of the Tower Hamlets. In 1855, he was made field-marshal. He died in 1865.

COMBINA'TION means the act of uniting or combining certain active elements; and it has come lately, in the legal and political phraseology of England, to mean the uniting together of persons having a common interest, with a view to promoting that interest. Thus, it may refer to employers uniting together to keep up prices or keep down wages; or it may apply to workmen uniting together to keep up wages. The word is now almost exclusively used in relation to the proceedings of the working-classes for retaining a monopoly of certain occupations, or for keeping up wages above their natural amount. C. is one of the most obvious, and in certain circumstances, one of the most justifiable and beneficial arrangements. Like all other human institutions, it has its good and bad shape—the former, when it is used for protection; the latter,

when it is used for oppression. It is a practical exemplification of the precept taught by the old man in the fable, when he recommended union to his sons by showing that the bundle of sticks could not be broken, but that each stick could be easily snapped when separated. The municipal corporations were combinations to protect the citizens against the power of the aristocracy, and a group of these municipal corporations formed themselves into a larger C., well known as the Hanse Towns, whose united influence not only braved the aristocracy, but exceeded that of many of the European monarchies. The guilds and other societies, whether of merchants or artizans, were combinations established for protection in violent times; though they were employed to further monopoly and interfere with freedom of trade, when more equal laws, and a higher social civilization, rendered them unnecessary for mere protection from external oppression.

The free-masons are a relic of a great guild, or secret society, pervading all Europe. The similarity to each other of contemporary Gothic buildings, however far apart, is explained by the circumstance, that they were built by a large C. of workmen, who all learned in the same school the same rules of art, and who had secret arrangements which enabled them to work together, and preserve the monopoly of the building-trade.

The oppressive laws to which the working-classes, even in this country, were subjected, fully justified them in combining for their own protection. The nature of those laws is explained, though not justified, by the fact, that they were less oppressive than the institutions of other countries where the working-classes were in actual serfdom; and that they mark, in reality, the steps of progress onwards from the state of slavery or serfdom in which all the working-classes were of old involved, even in this country. The boasted freedom of our Saxon ancestors was, indeed, very similar to that of the southern states of North America before the late civil war, since it was all enjoyed by the upper class, to whom the inferior persons were slaves; and the term freeman, still used in certain municipalities, of old distinguished those who were not slaves. The statutes of labor still retained a portion of this servitude, laying heavy penalties on workers in the various trades who refused to work at a regular fixed remuneration—often, of course, below the market value, otherwise it would not require to be protected by penalties. By the Poor Law Act, too, those who would not work might be veritably enslaved by being compelled to labor in the service of any householder. It may be said, indeed, to be the last stage of the emancipation of the working-classes from slavery when the C. Act was repealed in 1825. This act, which, after all, was a mild relic of the old laws for coercing workmen, subjected those who, whether verbally or in writing, entered into combinations for keeping up the wages of their labor, or limiting the hours of work, to be punished by imprisonment as criminals. There is no doubt that, in defiance of this act, secret combinations were held of a more dangerous and cruel character than any which have occurred since the repealing act of 1825, which rendered C. itself lawful, but punished any attempts to enforce the views of the combining workmen by violence or intimidation.

Both by the law of the land, and the public opinion on which it rests, it is now allowable for any class of men to combine together for the purpose of fixing the price at which they shall buy or at which they shall sell, provided their C. be entirely voluntary, and subject no one to coercion. All the landlords of a state, for instance, might combine to keep up the price of grain; but if they should get a law to enable them to exact this price by prohibiting any of their body from selling for less, or for prohibiting or limiting the importation of foreign grain, then their C. would be oppressive. In like manner, a hundred bricklayers or a hundred tailors may combine not to work for less than a certain remuneration, or not to work more than a certain number of hours daily; and they are quite free to do so, provided they do not compel any one to join their C., or do not interfere with those who are content to work on lower terms. The difficulty is to define compulsion.

Royal Commissioners appointed to inquire into the subject of trade-unions and combinations of workmen in 1869 and 1875, gave an account of the history and working of the modern law, and its modifications from time to time. It 1871, two acts were passed for the purpose of consolidating and settling the law; these were supplemented by the Trades-union Act Amendment Act, 1876, which more fully defines the nature of the combinations to which the acts apply, the rights of members in certain events, and imposes conditions in reference to registration. 34 and 35 Vict. c. 31, defined what trade-unions were to be deemed unlawful, and when their contracts were not enforceable, and provided for the legislation of trade-unions, and the protection of their property. The other act 34 and 35 Vict. c. 32, repealed all the former laws as to violence, threats, and molestation; but it has now been repealed by the Conspiracy and Protection of Property Act, 1875, 38 and 39 Vict. c. 86, which applies to the United Kingdom. The leading characteristic of this act was to abolish, as much as possible, the appearance of exceptional legislation as to the mutual relations of workmen and their trade-unions, and to make general rules applicable to all businesses and occupations. It was declared that an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen, shall not be indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. Before that statute, what was innocent when done by one person became indictable when done by three or more simultaneously.

The law relating to compulsion or intimidation is now generalized, as follows: Every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority (1) uses violence to, or intimidates such other person, or his wife or children, or injures his property; or (2) persistently follows such other person about from place to place; or (3) hides any tools, clothes, or other property owned or used by such other person, or deprives him of, or hinders him in the use thereof; or (4) watches or besets the house or other place where such other person resides or works, or carries on business, or happens to be on the approach to such house or place; or (5) follows such other person with two or more other persons in a disorderly manner, in or through any street or road—may either be indicted or punished summarily by justices of the peace, and fined £20, or imprisoned for three months with hard labor. But any person charged before justices is entitled to object to their jurisdiction, and claim a trial before a jury. If he is convicted by justices, he may appeal to Quarter Sessions. In Scotland, the offence can only be prosecuted by the procurator-fiscal or Lord-Advocate in the Sheriff Court or Court of Justiciary. Though breaches of contract by workmen are not now punished criminally, they are so in case of gas and water supply.

COMBINATION, Laws of, in Chemistry. See Atomic Theory.

COMBINATIONS, in Mathematics. See Permutations.

COMBING, of wool, cotton, &c. See Carding.

COMBRETA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, all natives of tropical countries. It contains about 200 known species, most of which are characterized by astringency.

COMBU'STION is the term applied to the process of burning, which usually consists in the oxygen of the air uniting with the constituents of the combustible substance. Thus, the C. of coal is due to the oxygen of the air passing into a state of chemical union with the carbon and the hydrogen of the coal, forming carbonic acid (CO_2) and water-vapor (HO). Such chemical combinations are always accompanied by the production of more or less heat, as in the case of decaying wood and other vegetable matter; but it is only when the action is so rapid as to evolve intense heat accompanied by light, that the process is called burning or combustion. Though the gaseous oxygen has as much to do with the process as the more solid material, coal, wood, paper, or cloth, yet the latter is alone styled the *combustible* or *burning body*, whilst the oxygen is invariably named the *supporter* of combustion. A few substances burn at ordinary temperatures, such as phosphorus, which glows when exposed to the air; but the generality of substances, such as wood, coal, &c., require to be raised in temperature or be set fire to before they possess the power of combining with the oxygen of the air. The amount of heat given out by the various combustibles when burned, is capable of being measured, and is definite. The same weight of the same combustible invariably evolves the same amount of heat during its complete C.; but different combustible substances give off different amounts of heat. The mode in which the heat evolved may be measured, is either (1.) To observe the quantity of ice which a given weight of the combustible will melt when burning; (2.) To notice the weight of water which the combustible will convert into steam; or (3.) To estimate the number of pounds of water which the burning body will raise from 32° to 212° F.

The last plan is the more easily managed and accurate, and serves as the index in the following table, which gives the number of pounds of water raised from 32° to 212° F. during the C. of one pound of each of the burning bodies:

Charcoal, pure	78	lbs. of water.
" from wood	75	"
Wood, dried,	36	"
" undried	27	"
Coal, bituminous	60	"
Turf and Peat	25 to 30	"
Alcohol	67½	"
Olive oil, wax, &c.	90 to 95	"
Ether	80	"
Hydrogen	236½	"

The amount of heat evolved appears, however, to be proportional to the quantity of oxygen required to burn the various combusti-

bles. Thus, when a similar volume of oxygen gas, or even ordinary air, is allowed to flow against the various combustible substances, the following results are obtained:

One lb. oxygen combining with	Raises from 32 to 212 degrees F.
Hydrogen	29½ lbs. of water.
Charcoal	29 "
Ether	28 "
Alcohol	28½ "

While the absolute amount of heat evolved during the C. of any burning body is the same, yet the sensible heat may vary according to the rapidity of the process. Thus, when phosphorus is exposed to the air at ordinary temperatures, it very slowly combines with oxygen, and gives out little heat at any one moment, but it is diffused over a great length of time; whilst if the phosphorus is set fire to in the air, it burns vividly, and gives out much heat and light for a short time; and still further, if the burning phosphorus be placed in pure oxygen, it enters into most vivid C., and evolves a most intense heat and brilliant light for a still shorter time. In the latter instances, the heat evolved at any one moment is greater, because more rapid, than that given off at the same time during the slower process of C.; but when allowed to proceed to a termination, there is as much heat produced during the whole time occupied in its development. The same remark applies to the coal placed in a furnace. So long as the door of the furnace is open, and there is little draft of air through the fuel, a moderate amount of heat is evolved, which may last for several hours; but when the door is shut, and much air is drawn through the coal, the latter is more quickly burned, and more heat is evolved during a shorter period of time than before, but in the long run there is the same amount of heat evolved.

COMÉDIE FRANÇAISE, or THEATRE FRANÇAIS, the national theater of France, subsidized by the state for the advancement of dramatic art. Its history dates officially from 1680, when Louis XIV. amalgamated by a decree the two rival companies of the Hôtel de Bourgogne and of the Hôtel Guénegaud, the latter being a fusion after Molière's death in 1673 of the Théater du Marais and the Troupe de Molière.

In 1682, the king granted to his comedians an annual pension of 12,000 livres or francs (about £480)—their first subsidy. In 1689, they took the name of La Comédie Française, and played under it down to the great Revolution with a succession of such artists as Baron, Adrienne Lecouvreur, Le Kain, and Mlle. Clairon. On the performance of Chénier's play of Charles IX. in 1789, violent political discussions arose among the performers, and they ultimately split into two sections: the Republican party under the young tragedian Talma (q. v.) establishing a new theater under the name Théâtre de la République; while the Royalist section remained in their old quarters under the title Théâtre de la Nation. In September 1793, the latter was suddenly closed by order of the 'Comité de Salut public,' and the players flung into prison, to be, however, gradually released. The Comédie Française is still managed by the regulations dictated by Napoleon at Moscow, modified, however, by resolutions passed in 1850 and 1859. The *sociétaires* are shareholders who divide the profits of the company among its members according to certain rules. To be admitted as *sociétaire*, an artist must have served in the theater as *pensionnaire* for one year, and all *sociétaires* must be re-elected at the end of ten years. After twenty years of service, they are allowed to retire with a pension of 4000 francs. The whole sum received from government annually is 240,000 francs. The theater being thus removed from the fear of temporary pecuniary failure, has been able to rise above the conditions attaching to a playhouse existing as a mere money speculation, and to educate the public taste, while providing an adequate and systematic training for young artists.

CO'MEDY. See DRAMA.

COME'NIUS, JOHN AMOS (properly KOMENSKY), a distinguished educational reformer of the 17th century, was born on the 28th of March 1592, according to some, at Comna, near Brünn; according to others, at Niwnitz, in Moravia. His parents belonged to the community of the Moravian Brethren. C. studied at Herborn, and then at Heidelberg, after which he traveled through Holland and England, and at last settled at Lissa, in Poland, where he was chosen bishop of the Moravian Brethren. In 1631, he published his *Janua Linguarum Reserata*, which was translated into many European, and even into some Oriental languages. In this work, he points out a method of learning languages new at that time, which may be called the intuitive or perceptive system, in which the pupils were taught by a series of lessons on subjects easily understood or appreciable by the senses—such as natural history, the sciences, different trades and professions, &c. C. also published about the same time the *Ratio Disciplinæ Ordinisque Ecclesiæ in Unitate Fratrum Bohemorum* (1632), republished with remarks by Buddæus (Halle, 1702); and his *Pansophiæ Prodromus* (1639).

In 1641, C. was invited to England, to assist in reforming the system of public instruction; but as the breaking out of the civil war prevented the execution of this design, he went to Sweden, where he was patronized by Oxenstiern, who gave him a commission to draw up a plan for the organization of schools in Sweden, which he completed at Elbing, four years afterwards. He next went to Hungary for a similar purpose. Here he composed his celebrated *Orbis Sensualium Pictus*, or the Visible World (Nürn. 1658), the first picture-book for children, which has been often reprinted and imitated. Finally,, he settled in Amsterdam, where he published several other works. C. died at Naarden on the 15th October 1671. In the latter years of his life, C. gave way to fanaticism, misinterpreted the Revelation of St. John to suit his fancies of the existing state of Europe, and expected the milleneium in 1672. An interesting account of the wanderings and sufferings of C., and of his great services in the cause of popular education, is given in Lourie's *Conenius, his Life and Work* (1881).

CO'MÉS, an ancient officer, with territorial jurisdiction. See EARL.

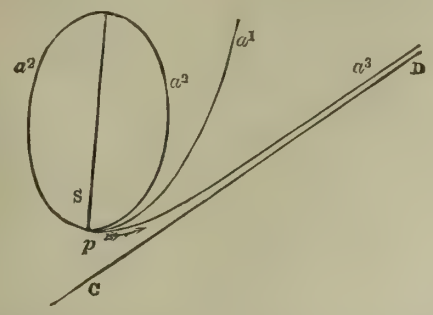
CO'MET. The word C. is derived from the Gr. *kóme*, hair, a title which had its origin in the hairy appearance often exhibited by the haze or luminous vapor, the presence of which is at first sight the most striking characteristic of the celestial bodies called by this name. The general features of a C. are—a definite point or nucleus, a nebulous light surrounding the nucleus, and a luminous train preceding or following the nucleus. Anciently, when the train preceded the nucleus—as is the case when a C. has passed its perihelion, and recedes from the sun—it was called the beard, being only termed the tail when seen following the nucleus as the sun is approached. This distinction has disappeard from all modern astronomical works, and the latter name is given to the appendage, whatever its apparent position. Neither this luminous attendant, the tail, nor the nucleus is now considered an essential cometary element, but all bodies are classed as comets which have a motion of their own, and describe orbids of an extremely elongated form. There are several plain points of difference between comets and planets. The planets move in the same direction, from west to east, which is astronomically called 'direct motion;' but the movements of comets are often from east to west, or retrograde. The orbits of all the planets are confined to a zone of no great breadth on either side of the ecliptic; but the paths of comets cuts the ecliptic in every direction, some being even perpendicular to it. The orbits of all the planets are nearly circular; or, more properly speaking, are eclipses of very small eccentricity. The orbits of comets, on the other hand, present every variety of eccentricity, some of them being eclipses or elongated closed orbits of various degrees of elongation; others, hyperbolas; while the majority have a form of orbit not differing sensibly from the parabola, which is the limiting form of curve to which both the ellipse and hyperbola approximate, under given conditions.

Let *p* be the point of perihelion passage of a C., and let the direction of its motion be in the direction indicated by the arrow. There is a certain velocity of motion at this point which would give the orbit the form of a parabola, pa^1, the direction of motion always approached to being parallel with the straight line through *p*S. Any velocity less than this would cause it to describe a closed curve pa^2a^2; any greater velocity would cause it to describe the hyperbola pa^3, in which case it would approximate to the direction of the straight line CD, and would never return. This would be the case if there were no disturbing force to interfere with the sun's attraction; and conversely, comets approaching the sun along the various paths above described, would pass the perihelion with the various velocities above indicated. Any attraction, however, of an extraneous body interfering with the attraction of the sun might change the orbit from the ellipse to the hyperbola, and *vice versâ*, or from the parabola to either. As, however, there is only one parabola corresponding to infinite sets of ellipses and hyperbolas, an interfering cause is not likely to change the orbit from an ellipse or hyperbola to the parabolic form. Of about 200 comets whose orbits have been obtained with more or less accuracy, 40 appear to have described ellipses, 7 hyperbolas, and 150 orbits that cannot be distinguished from parabolas.

The discovery that comets are celestial bodies, extraneous to our atmosphere, is due to Tycho Brahé, who ascertained the fact by observations of the C. of 1557. Newton succeeded in demonstrating that they are guided in their movements by the same principle which controls the planets in their orbits; and Halley was the first, by determining the parabolic elements of a number of comets from the recorded observations, to identify the C. of 1682 with one which had been observed in 1607 and the observations recorded by Kepler and Longomontanus, and also with a C. observed in 1531 by Apian, at Ingoldstadt, and thus confidently to predict the return, at the end of 1758 or beginning of 1759, of a C. which would have the same parabolic elements. These parabolic elements are elements of a parabola nearly coincident with the elongated elliptic orbit of the comet. They are—1. *The Inclination.* 2. *The longi-*

tude of the node. These two determine the plane of the orbit. 3. The longitude of the *perihelion*, or point of nearest approach to the sun. 4. The perihelion distance, or nearness of approach to the sun. 5. The direction of motion, whether *direct* or *retrograde*.

To determine these parabolic elements, three obsevations of the



C. are sufficient; and by a table of such elements deduced from the recorded observations, it is possible at once to ascertain whether any newly observed C. is identical with any that have been previously observed. To predict, however, with accuracy the time of the return of a C., a much more accurate calculation must be made of the orbit, taking into account the perturbations of the planets to whose influence it is subject. This difficult problem was solved, in the case of Halley's C., by the joint work of Laland, Madame Lepante, and Clairaut, who announced, in November 1758, just as astronomers began to look out for the return of the C., that it would take 618 days more to return to the perihelion than on the preceding revolution. The perihelion passage was fixed about the middle of April 1759; but Clairaut distinctly forewarned the world that, being pressed for time, he had neglected small values, which collectively might amount to about a month in the seventy-six years. The C. passed the perihelion on the 12th March 1759, exactly a month before the time announced, but within the assigned limits of divergence from that date. The elements of its orbit proclaimed it to be the C. of the former periods by their similarity. For the next perihelion passage, the different calculations executed by MM. Damoiseau and De Pontécoulant, fixed the 4th, the 7th, and the 13th November 1835. Subsequently, observations indicated the 16th—that is to say, a deviation of only three days from what turned out the most accurate calculation, and a deviation of 12 days from the most remote. We have adverted to the perihelion passages of this C. in 1531, 1607, 1682, 1759, and 1835. It is also now identified with a C. observed in 1456, and one in 1378, recorded by Chinese observations. There are no sufficietly reliable Europeon observations previous to 1456, but it is conjectured by Arago, that this C. is the same with the C. of 1305; that of 1230; a C. mentioned in 1006 by Hali Ben Rodoan; that of 885; finally, a C. seen in the year 52 before our era.

This account of Halley's C. has been given at length, to illustrate the principles on which the calculations are made. The annexed wood-cut represents some of the appearances which that C. presented, in different parts of its orbit, on its last visit in 1335—*a*, *b*, *c*, in approaching the sun; *d*, *e*, in retreating. There are three other comets whose periodicity is established, and whose paths are accurately known.

1. That of Encke, with a short period of 1204 days. Its orbit does not extend so far as the orbit of Jupiter, and a slight acceleration in its periodic times of return has suggested the possibility of the space, within our solar system at least, being occupied by a resisting medium, though of extreme rarity.

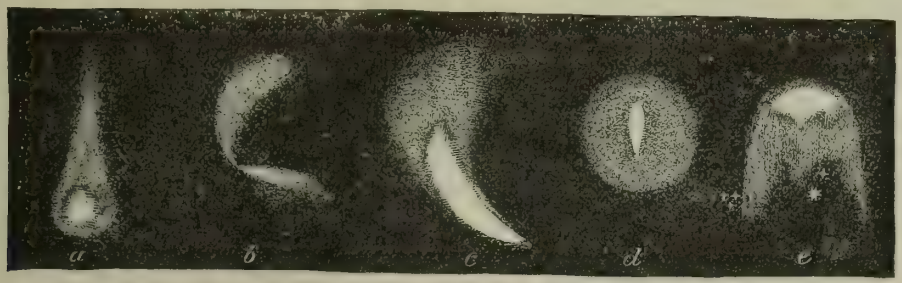
2. That of Biela or Gambart, having a period of six years and three-quarters. During the visit of the C., in 1846, it was seen to separate into two distinct comets, which kept moving side by side till they disappeared. On the return of the C. in the autumn of 1852, the distance between the two nuclei had much increased. Since then, although repeatedly due, it has not again been seen.

3. That of Faye, with a period of seven years and a half.

The orbits of both these last mentioned extend beyond the orbit of Jupiter, but none so far as that of Saturn.

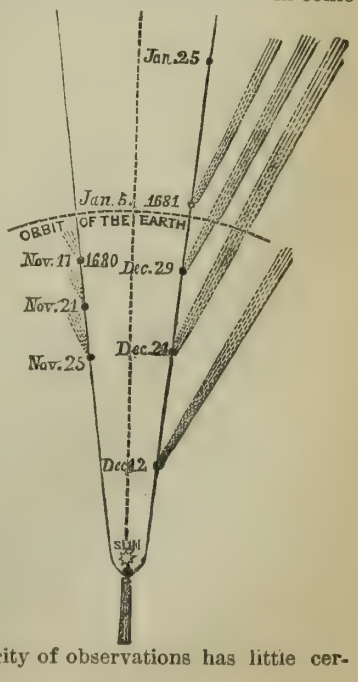
Besides these three, there are others whose orbits are ascertained with a less degree of accuracy and certainty, requiring the test of future returns to fix their periodicity. In all, some fifteen periodic comets are known. One other deserves mention from the great peculiarities of its course.

In the month of June 1770, Messier discovered a C. which remained visible a long time, and enabled Lexell to ascertain the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit, and corresponded to a periodic revolution of 5½ years. This suggested grave difficulties. It had been found impossible to identify this C. with any previously observed, and yet it was difficult to conceive that a bright C., with so short a period of return, should have previously escaped observation. What was still more remarkable, it was never seen again, though anxiously looked for in the places where Lexell's orbit would have brought it. It became popularly called Lexell's lost C., and gave occasion to many sarcasms by the wits of the day at the expense of astronomers, who nad so much boasted of having found the key to the cometary movements. In the present day, the explanation is complete. The C. was never seen before 1770, because its orbit previously had been totally different, its nearest point to the sun having been as distant as the path of Jupiter. Its appearance that year arose out of the fact, that in 1767 it was in such close contact with Jupiter, moving in the same direction, and nearly in the same plane, that the attraction of this planet entirely changed its orbit. But why has the C. not since been seen? Its passage to the point of perihelion in 1776 took place by day;



and in 1779, before another return, it again encountered the vast body of Jupiter, and suffered a fresh orbital derangement, the attraction of the planet deflecting it into more distant regions, and so changing the form of the orbit, that if it had again been visible, it would not have been recognized as identical with Lexell's comet.

The celebrated C. of 1680, which furnished Newton with the occasion for proving that comets revolve around the sun in conic sections, and that, consequently, they are retained in their orbits by the same force as that which regulates the movements of the planets, appears to have been about the most remarakable for brilliancy of any of which we have authentic accounts. This C. is supposed to be identical with the one that appeared about the time of Cæsar's death (44 B.C.), with that which was seen in the reign of Justinian in the year 531, and with another in the year 1106, in the reign of Henry II., the period of revolution, according to the orbit calculated for it by Whiston, being about 575 years. There is, however, some doubt among astronomers as to the real form of its orbit, the one assigned to it by Encke giving it a period of 8813 years. This C. approached nearer to the sun than any known, except perhaps the C. of 1843, the calculation of whose perihelion distance, from the paucity of observations has little cer-



tainty. The C. of 1680 approached the sun within the 163d of the semi-diameter of the earth's orbit. The annexed diagram shows a part of its path; the same diagram shows the direction of the tail. This is nearly always away from the sun, frequently assuming a curved form. It increases in length with its proximity to the sun, but does not acquire its greatest length till after passing the perihelion. These are usual characteristics of comets, which were exemplified by this one in a remarkable degree. These phenomena might be accounted for if we were to regard the train as vaporization produced by the intense heat to which the body of the C. is exposed in its approach to the sun.

In the present century, the most brilliant comets have been those of 1811, 1843, 1858 (Donati's), 1861, 1880, 1881, and the great comet of (*b*) of 1882.

Spectroscopic investigation, so far as yet pursued, points to the conclusion that the nucleus is self-luminous, but that the tail shines with reflected light. It has been discovered recently, in determining the tracks of those streams of dark bodies that cause meteoric showers, that some of the tracks coincide with the orbits of well-known comets. From this, it is inferred that star-showers and comets may be only different manifestations of the same thing (see METEORS).

What the matter of the comets consists of is, of course, only a subject for speculation. The composition of the nebulosity and the tail is, at all events, something of almost inconceivable tenuity, as shown by three considerations. 1. Stars seen through them suffer no diminution of brightness, though the light must have to

Appearance of Halley's Comet at Constantinople in 1456.

traverse sometimes millions of miles of the cometary atmosphere. 2. Though the thickness of the tail of a C. may be millions of miles, and its length of course much greater, the comets have never been observed to cause any sensible disturbance of the planetary motions, though approaching near enough to be themselves so much effected as to change the entire character of the orbit. 3. The curvature of the tails, and the acceleration of the periodic time, in the case of Encke's C., indicate their being affected by a resisting medium, which has never been observed to have the slightest influence on the planatary periods, though so long observed. Even the nuclei of comets appear to be of extremely small density. This may be inferred, though with less force than regards the tails, from the two last considerations above mentioned; and, moreover, there are reliable accounts of stars of a very low order of magnitude being seen through the nuclei themselves.

Comets have been alternately regarded with terror and with welcome in the popular mind. The appearance of Halley's C., in 1456, just as the Turks had become masters of Constantinople, and threatened an advance into Europe, was regarded by Christendom with a superstitious dread, and to the Ave Maria was added the prayer: 'Lord save us from the devil, the Turk and the comet.' At Constantinople, the occurrence of a lunar eclipse at the same time, increased the portentousness of the event. The discoveries of science of the magnitude of the space filled by their bodies, and their prodigious velocity, together with the confessed impossibility of always predicting their approach, produced fears of another kind, which have sometimes been, especially in France, extravagantly exaggerated in the public mind. The groundlessness of such alarms, from the extreme improbability of collision with the nucleus, the probable innocuousness of a contact with the extremely attenuated surrounding matter, and possibly, to the greater part of the world, of a collision with the nucleus itself, will be sufficiently evident from what has been said above.

It is probable that already, on many occasions, some of the attenuated vapor in the tail of comets must have come within the earth's attraction, and been absorbed in its atmosphere. Whether the effect is deleterious or salubrious, or whether it has any perceptible influence at all, is only matter of speculation. The salubrity of cometary influence is now a popular idea; and the vintages of 1811 and 1858 were favorable seasons, whose produce is often advertised as the C. wines. It is scarcely worth while, however, to follow further speculation on these subjects, and it has been considered preferable to confine this article chiefly to the description of the general characteristics of comets, and the facts respecting them afforded by science.

Common Comfrey.

CO'MFREY (*Symphytum*), a genus of plants of the natural order *Boragineæ*, distinguished by a 5-cleft or 5-partite calyx, and a corolla enlarged upwards, its throat closed by awl-shaped scales. The species, which are not numerous, are natives of Europe and the north of Asia. They are perennial plants of coarse appearance, although occasionally to be seen in flower-borders. *S. officinale* (the COMMON C.) and *S. tuberosum* are natives of Britain, frequent in shady and moist places *S. officinale* was formerly much esteemed as a vulnerary, on account of its astringency. Its young leaves and its blanched shoots are also occasionally used as boiled vegetables. The Prickly C. (*S. asperrimum*) a native of Siberia, 6—10 feet in height, has been highly recommended for feeding cattle.

COMINES, or COMYNES, PHILIPPE DE, Sieur d'Argenton, a French statesman, and the author of some very interesting and valuable *Memoirs*, was born at the castle of Comines, not far from Lille, in 1445. After receiving a careful education, he passed into the court of Burgundy about 1466, and attached himself particularly to Charles the Bold (then Comte de Charolais.

In 1472, C., who was anything but punctilious in his notions of honor, entered the service of Louis XI., the rival and enemy of Charles, who immediately covered him with honors, and made him one of his most confidential advisers. He proved himself a very suitable agent for carrying out the designs of the crafty monarch; but after the death of Louis, by his adherence to the party of the Duke of Orleans, C. incurred the displeasure of the government of Anne of Beaujeu, and was sentenced to a forfeiture of a fourth of his estates and to ten years' banishment. This punishment, however, does not seem to have been carried out, for after a few years we find C. again employed in important affairs of diplomacy. Though engaged in the service of Charles VIII. and the Duke of Orleans, afterwards Louis XII., C. failed to win the confidence of these masters. He died at his castle of Argenton, October 17, 1509. C.'s *Memoirs* are admirably written, and afford abundant proof that he possessed a clear, acute, and vigorous mind. He seems to have looked keenly into the heart of every man who crossed him in life, and with cool, severe anatomy, dissects him for the benefit of posterity. The best edition of his *Memoirs* was edited by Lenglet Dufresnoy (4 vols., London, 1747).

COMI'SO, a town of Sicily, in the province of Syracuse, about 40 miles west-south-west of the city of that name. It has paper manufactures, and a population of (1871) 16,694.

COMI'TIA (Lat. *cum*, with or together, and *ire*, to go) were the legal or constitutional meetings of the Roman people, convened by a magistrate, for the purpose of putting a question to the vote. This definition at least comprehends all the C., except the *C. Calata*, where the people were merely present as spectators. There were several kinds of C. (*C. centuriata*, *C. tributa*, &c.) held for different purposes; and according to the mode of constituting the C., the preponderance lay with the patricians or with the plebeians.

CO'MITY OF NA'TIONS—more frequently mentioned by its Latin equivalent, *comitas gentium*—is that species of international legal courtesy by which the laws and institutions of one country are recognized and given effect to by those of another. 'In the silence of any positive rule,' says Mr. Justice Story, 'affirming or denying, or restraining the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests.' From the existence of so great a number of independent states on the continent of Europe, and of federated states in America, the *comitas gentium* is more called into play in these countries than in our own, and it has consequently been more exten-

sively discussed by their legal writers. See Story's *Conflict of Laws*. See INTERNATIONAL LAW.

CO'MMA, in the mathematical study of sound, is applied to two small intervals, which, by comparison and calculation, arise as the difference between the proportions of certain other intervals of the diatonic scale. The larger, but seldomer occurring C. is called the *C. ditonicum*, or the Pythagorean C., being the difference between the true octave, whose ratio is 2 : 1, and the interval which arises when the octave is obtained by tuning a progression of twelve perfect fifths, or arithmetically by adding their values together; by which process it is found that the last sound is greater than the true octave in the proportion of 531,441 to 524.288. The smaller C., *C. syntonum*, or C. of Didymus, is—First, the difference between the large whole tone, the ratio of which is 9 : 8, and the small whole tone 9 : 10, which is found in the compound of these ratios produced by multiplying together respectively their antecedents, 9 and 9, and their consequents, 8 and 10, to be 81 : 80. Second, The difference between the great limma, 27 : 25, and the half-tone, 15 : 16, which is found by the same process, and then reducing the resulting ratio to its least terms, to be also 81 : 80. Third, The difference between the diesis, 128 : 125, and the diaschisma, 2048 : 2025, which by the same process gives 81 : 80; and lastly, the difference between the *small* limma, 135 : 128, and the small half-tone, 24 : 25, which again gives the proportions 81 : 80. The difference between the *C. ditonicum* and the *C. syntonum* is exactly the *schisma;* therefore, the aggregate of the diaschisma and schisma, if they be added together, is neither more nor less than the syntonic comma. This C., again added to the diaschisma, makes up the diesis, and added to the great half-tone, makes up the great limma. It follows therefore that, practically, two enharmonic tones in perfect tune never differ by a syntonic C., and it is wrong to say that *d* flat is higher than *c* sharp by a C., while the real difference is that of a diesis, 128 : 125. In the equal-tempered scale, these varieties do not exist. The term *syntonic* comes from the Greek, and means equal-sounding.

COMMANDA'NT, in military matters, is a temporary commander, in place of the real chief; such as a captain-commandant, lieutenant-commandant, &c. In foreign armies the designation is more frequently applied than in the British, especially to the commanders of garrisons.

COMMA'NDER, in the British Navy, is an officer next under a captain in rank, and serves either as second in command in a large ship, or in independent command of a vessel smaller than the sixth rate. In matters of etiquette, he ranks with a lieutenant-colonel in the army. There were, in 1873, 155 commanders in commission, with pay of £1 a day; while there were 154 on half-pay, but eligible for re-employment, and 326 on retired half-pay; but the whole list of those employed, or eligible for employment, is to be reduced to 200. In 1880 there were 140 commanders in commission, and 146 staff-commanders and navigating-lieutenants. Retirement is optional at the age of 45; and compulsory at 50, or after 5 years without employment.

COMMANDER-IN-CHIEF, is the highest staff appointment in the British army. It is held by the general commanding all the forces in India, and would probably be given to the leader of any *large* army in the field, whether abroad or at home. Formerly, the army at home was administered by an officer of this rank; but since the death of the Duke of Wellington in 1852, the military administration has vested in an officer holding no higher commission than that of 'General on the Staff;' who is called the general (or field-marshal, according to the holder's army rank) commanding in chief. Since 1855 this officer has been strictly subordinate to the Secretary of State for War. The office of the C., technically known as the 'Horse Guards,' is a department of the War Office, and comprises the sub-departments of the military secretary, the adjutant-general, and the quartermaster-general, with a staff of clerks. Under the 'War Office Act' of 1870, and by orders in council of that year, the officer commanding in chief is one of the three great officers who administer the military affairs of the country under the Secretary of State for War; his department being that of military command, discipline, and promotion. In practice, he makes all promotions and military appointments; though, in theory, these are all made on the responsibility of the Secretary of State. Appointments to very important positions on the staff would not be made without the supervision of the minister and probable concurrence of the cabinet. The officer commanding in chief is responsible for all recruiting operations, and for the appropriation of troops to particular localities; but he exercises rather a general inspectional control than any immediate command over the men. The actual command vests in the general officers commanding the districts into which the kingdom is parcelled.

A *naval* C. is the chief admiral at any port or station.

COMMANDITE, SOCIETE EN, or PARTNERSHIP IN, an expression used for at least two centuries in France, to express a partnership in which one may advance capital without taking charge of the business, or may become a 'sleeping partner,' as it is called in this country. The term owes its origin to the old meaning in the commercial nomenclature of France of the word command, which was applied to one person authorizing another to transact business for him. The working partner had a *commande* from him who merely advanced capital. The term has acquired importance of late in political economy, because the law of France could exempt the sleeping partners from responsibility beyond the amount they might agree to be responsible for. On the other hand, by the law of the United Kingdom, down to the passing of the limited liability act, every partner of a company was liable for all its debts. Hence, in the discussions about the question, whether it would be prudent to relax this law, and permit persons to invest money in trading companies without undergoing this responsibility, such companies were called 'partnerships in commandite.'

COMMELYNA'CEÆ, a natural order of endogenous plants, consisting of herbaceous plants, with flat, narrow leaves, usually sheathing at the base. The calyx is 3-partite; the petals three, sometimes cohering at the base. The stamens are six, inserted under the ovary, which is 3-celled; the style is single. The fruit is a capsule, with 2—3 cells and 2—3 valves, bursting through the middle of the valves. The seeds are often in pairs, inserted by their whole side on the inner angle of the cell; the embryo lies in a cavity of the albumen. The order contains more than 260 known species, natives chiefly of warm climates; but a few occur in North America. None are European. *Tradescantia Virginica*, or SPIDER-WORT, common in our flower-gardens, is a familiar example of the order. *Commelyna cœlestis* is a fine ornament of our flower-gardens. The treatment is somewhat like that of the dahlia.

COMMEMORA'TION, or ENCÆ'NIA, the great festival of the Oxford academic year, usually takes place on the third Wednesday after Trinity Sunday. It is of very ancient date, public exercises and recitations having been held from time immemorial in honor of the Act, or period when Masters of Arts and Doctors complete their degrees. The proceedings consist of a Latin oration in honor of the founders and benefactors; the presentation of the honorary degree of D.C.L. to strangers eminent in science, politics, &c.; and the recitation of the Newdigate or English prize poem, the Latin prize poem, and the Latin and English prize essays. The more strictly academic and solemn portion of the proceedings was frequently wont to receive scanty attention from a great part of the audience; and the noisy humors of the gallery have often encroached on the stately periods of the public orator. In 1876 the undergraduates were removed from the special gallery they had hitherto occupied, and distributed amongst the general audience, which includes ladies and strangers as well as members of the university.

COMME'NDAM. When a clerk is promoted to a bishopric, all his other preferments become void from the moment of consecration; but a method was devised by which the substantial interest in the living was retained by its being *commended* to the care of a bishop (called the commendatory) by the crown, till a proper pastor should be provided for it. Such a living was called an *ecclesia commendata*, and it was said to be held *in commendam*. The holding on this title might be really temporary for one, two, or three years, or it might be perpetual. By 6 and 7 Will. IV. c. 77, s. 18, it is provided that no ecclesiastical dignity, office, or benefice shall be held in C. by any bishop, unless he shall have held the same when the act passed.—Stephen, iii. 37.

COMMENDA'TORS, in Scotland, in Roman Catholic times, were stewards appointed to levy the fruits of a benefice during a vacancy. They were mere trustees; but gradually the pope assumed the power of appointing C. for life, without any obligation to account. 'This was chiefly intended as a cloak for the plurality of benefices, and to evade the canon of the second council of Nice, by which one benefice only was allowed to be given to one and the same churchman; but all commendators were by our law prohibited, even during popery, by 1466, c. 3, except those that should be granted by bishops for a term not exceeding six months.'—*Erskine's Instit.*, vol. i. p. 98, Ivory's edit. See ABBOT.

COMMENTRY, a town of France, in the dep. of Allier, eight miles south-east of Montluçon, on the Œuil. It stands in the center of one of the most important coal-fields of France, and within the last fifty years has risen from a mere village to be a busy and populous town. Pop. 10,000, mostly engaged in the coal-mines and iron-works. A railway connects it with Montluçon and other places, and with the Canal de Berry. In 1846, a fire consumed an enormous quantity of the coal in the mines.

COMME'NSURABLE. Two quantities or numbers are said to be commensurable which are of the same kind, and each of which contains a third quantity or number a certain number of times without remainder. See INCOMMENSURABLE MAGNITUDES.

COMME'RCIAL LAW. See MERCANTILE LAW.

COMMINA'TION is from the Lat. *comminor*, to threaten, and is the name given to a penitential service used in the primitive church. In the earliest ages, those who were guilty of grievous and notorious sins were put out of the church, until, on their repentance, and after long trial, they were restored to full communion. It seems that, at least from the beginning of the 8th c., there was an office of this kind for public penitents on the first day of Lent; but from various causes, the penitential discipline became extinct, both in the Eastern and Western Churches, and the office for Ash-Wednesday (so called from the penitents coming clad in sackcloth and ashes) is the only memorial of it left. The office, as used in the Church of England, is nearly the same as those found in the Salisbury and York missals. The curses contained in Deut. xxvii. against impenitent sinners are read, and the congregation answer 'Amen' to every sentence, as acknowledging the justice of the sentences. See Bingham's *Antiquities*.

COMMISSA'RIAT is a name for the organized system whereby armies are provided with food, and daily necessaries other than those connected with actual warfare. Among the ancients the Romans attended best to the C.; the *quæstors* were the commissaries. In feudal times, the soldiers were mainly dependent for food on their lords; but they lived very much by plunder. During the wars of the Crusades, the C. was so utterly neglected, that thousands died of starvation.

In England, the first germ of the modern C. appeared in the office of *proviant-master*, in the time of Queen Elizabeth. Under Charles I., commissaries were stationed in the different counties. Under Marlborough's command, the troops were supplied by contract; he received a percentage, and peculation was very common. After many changes during the 18th c., a commissary-general was appointed in 1793, to superintend all contracts for food and forage. The dire experience of the Crimean war showed how greatly reform was required in this important department. In 1858 and 1859, accordingly, it was newly organized; and remained, until 1870, a War-office department, under a commissary-general-in-chief.

In 1870, the Commissariat was merged with other supply departments in the great 'Control Department,' which, under the Surveyor-General of the Ordnance, performed all the civil administrative duties of the army. In Dec., 1875, the Control Department fell from its high estate, and the 'Commissariat and Transport Department' arose from its ashes. Its duties are the provision of food, fuel, lodging, and transport: a function on which it is needless to say the very existence of the army depends. The Department is administered by the Director of Supplies, at the War Office, who is an officer on the staff of the Surveyor-General. The ranks of Commissariat officers are commissary-general (ranking as brigadier-general), deputy-commissary-general (as colonel), assistant commissary-general (as lieut.-colonel), commissary (as major), deputy-commissary (as captain), assistant-commissary (as lieutenant), and sub-assistant commissary.

CO'MMISSARY, in general, is any one to whom the power and authority of another is committed. In this sense it is nearly equivalent to commissioner. In ecclesiastical law, a C. is an officer appointed by a bishop to exercise jurisdiction in parts of the diocese which are so distant from the episcopal city that the people cannot be conveniently summoned to attend the principal court.

When the papal authority, and all jurisdiction which flowed from it, was abolished in Scotland, by the Acts 1560 and 1567, a supreme C. court was established in Edinburgh, by a grant of Queen Mary, dated February 8, 1563. This court had jurisdiction in actions of divorce, declarators of marriage, nullity of marriage, and all actions which originally belonged to the bishop's ecclesiastical courts. Its powers were gradually con-joined with those of the Court of Session, and it was finally abolished in 1836 (6 and 7 Will. IV. c. 41), the small remains of its once important jurisdiction being united in the sheriff of Edinburgh. The inferior commissariats, which had usually been commensurate with the dioceses, were dealt with by a previous statute (4 Geo. IV., c. 97), each county being erected into a separate commissariat, of which the sheriff was commissary.

The jurisdiction of these courts so conjoined with that of sheriffs was, in 1876, finally transferred to the sheriffs absolutely, and the separation between the two sets of officers ended, except in the case of the Commissary Clerk of Edinburgh. See Alexander on *Practice of the Commissary Courts in Scotland*, 1858, which gives a very interesting sketch of the history, constitution, and jurisdiction of these courts.

COMMI'SSION, a writing, in the form of a warrant or letter-patent (see PATENT), authorizing one or more persons to perform duties or exercise powers belonging to another, or to others. Instruments of delegation, bearing this title, are issued by the crown to officers in the army and navy, judges, justices of the peace, and others.

Another class of commissions are those granted sometimes by the crown, and sometimes by parliament, to a body of persons, either to inquire into the condition of certain institutions or branches of the public service, or to exercise certain powers, or execute certain measures for their improvement. Persons holding such commissions, deriving no other title from their appointment, are called commissioners; e. g., the English Ecclesiastical Commissioners, the Commissioners for the Relief of the Poor, the Commissioners for the Affairs of India, the Emigration Commissioners, &c.

COMMISSION DEL CRE'DERÉ. See DEL CREDERE COMMISSION.

COMMISSION MERCHANT, or AGENT, called also a broker, or factor, is a person employed to sell goods consigned or delivered to him by another who is called his principal, for a certain percentage, commonly called his commission or factorage. As the goods thus received are said to be consigned, the C. M. or agent is often called a consignee.

COMMISSION OF ASSEMBLY. See GENERAL ASSEMBLY.

COMMISSIONAIRES are a class of attendants at continental hotels, who perform certain miscellaneous services. Employed to attend at the arrival of railway-trains and steam-boats to secure customers, they wait to take charge of luggage, see it passed through the hands of the custom-house officers, and send it on to the hotel; for all which service they charge a fee. They likewise procure visés to passports, and act as valets-de-place. Lately, a body of C. has been established in London, and also in Edinburgh, consisting of maimed soldiers who have retired with a pension, and are of unexceptional character.

COMMISSIONS, ARMY, are warrants for serving the crown in certain military offices. Those holding such authority are called *commissioned officers*. Non-commissioned officers form a step intermediate between commissioned officers and private soldiers. First commissions in the probationary rank of sub-lieutenant are granted by competitive examination open to every British subject of proper age and character. Subsequent—i. e., higher—commissions are given, up to the rank of lieutenant-colonel, by 'selection tempered by seniority.' The commission of colonel is attained by service only, and commissions as major-general, lieutenant-general, and general follow by pure seniority. These remarks apply to cavalry and infantry only: commissions in the Artillery and Engineers are obtained—first, by passing a severe course of study at Woolwich Academy, admission to which is by open competition; later commissions by seniority entirely. Before November 1, 1871, commissions in the cavalry and infantry were partly obtained by purchase, under the system, now abolished, called the PURCHASE-SYSTEM. The prices of commissions rose gradually from the time of Charles II. until the Russian war of 1853, when the *regulation prices* were as follows:

Rank.	Regulation Price of Commissions.	Diff. in value between the several Com. in succession.
LIFE GUARDS.		
Lieutenant-colonel	£7250	
Major	5350	£1900
Captain	3500	1850
Lieutenant	1785	1715
Cornet	1260	525
DRAGOON GUARDS AND DRAGOONS.		
Lieutenant-colonel	£6175	
Major	4575	£1600
Captain	3255	1350
Lieutenant	1190	2035
Cornet	840	350

(The prices of cavalry commissions were reduced in 1861 to infantry rates.)

FOOT GUARDS.		
Lieutenant-colonel	£9000	
Major, with rank of Colonel	8300	£ 700
Captain, " Lieut.-col	4800	3500
Lieutenant, " Captain	2050	2750
Ensign, " Lieutenant	1200	850

(In 1857, purchase was limited to the lower three ranks.)

LINE REGIMENTS.		
Lieutenant-colonel	£4500	
Major	3200	£1300
Captain	1800	1400
Lieutenant	700	1100
Ensign	450	250

The conditions of promotion, and the operation of the purchase system, will be considered under PROMOTION and PURCHASE-SYSTEM. In the navy also, the chief officers hold their authority by commission. See OFFICERS; PROMOTION.

COMMI'SSIONER, in Scotch Bankruptcy. This office has little or no resemblance to that of the judge in England bearing once such a title. In Scotland, three commissioners are appointed by the creditors to advise, and in certain cases to superintend the trustee, who is the party charged with the realization and distribution of the estate. The commissioners audit the trustee's accounts, they fix his remuneration, and they have to ascertain that the moneys collected by him have been duly lodged in bank.

They themselves are not entitled to remuneration; and they cannot purchase any portion of the estate. Their qualification is to be creditors, or mandatories of creditors; but any disqualification for the office of trustee also unfits for this office.

COMMI'TMENT is the imprisonment of any person by warrant or order. When C. is by warrant of a magistrate after examination and before trial, the confinement of the accused, being for safe custody and not for punishment, is regulated by special statutes as to diet, optional employment, visits, &c. C. may be for trial or further examination. It is also used with reference to imprisonment of debtors in certain cases under the Debtors Act, 1869.

COMMI'TTEE (Fr. *comité*), a portion, generally consisting of not less than three members, selected from a more numerous body, to whom some special act to be performed, or investigation to be made, is *committed*. But though a C. usually consists of several members of the body by which it is appointed, it may consist of one member, or, what is more frequent, of the whole members acting in a different capacity from that which usually belongs to them. This latter form of C. is known in parliament as a C. of the whole House. In order to mark the distinction between the House itself and the same body when thus resolved into C., the Speaker in the Commons, and the Chancellor in the Lords, as soon as the C. is formed, leave the chair, which is occupied by the Chairman of C., a paid official, who is appointed at the commencement of every parliament. In the Commons, moreover, the mace, which usually lies on the table, is put under it when the House goes into committee. Of committees of the whole House, the most familiar examples are Committees of Supply (q. v.) and of Ways and Means (q. v). The vote of a C. is of no force till it has been reported to and received by the House. In the case of every public bill, moreover, a C. of the whole House is constituted after the second, and before the third reading, in order that the details of the measure may be more carefully adjusted. In private bills, analogous functions are performed by select committees. Occasional matters requiring special investigation are also remitted to select committees. These, for the most part, conduct their investigations in public; but there are instances also in which the public safety seems to require secrecy, in which they deliberate with closed doors, and they are then called *Secret Committees*. In 1883, the House delegated part of its functions to *Grand* or *Standing* Committees—one for law affairs, the other for trade, shipping, and manufactures. Bills are in every case to be committed to them by order of the House. Each committee has from 60 to 80 members, nominated by the committee of selection; and the procedure is as in select committees.

CO'MMODORE, in the Navy, is a rank intermediate between an admiral and a captain. It is not permanent, but is bestowed for a time on a captain. Usually, a C. commands more ships than one, detached from a fleet on some special service; he hoists at that time a pendant. If a C. of the first class, his pendant is broad and red, pointed at the outer end; if of the second class, blue. A C. is privileged to have a commander under him in his ship, in the same way as an admiral is privileged to have a captain. The C., in matters of etiquette, ranks on a level with a brigadier-general in the army.

CO'MMODUS, Lucius Aurelius, a Roman emperor, born 161 A.D., was the son of Marcus Aurelius Antoninus. When he was summoned to the throne on his father's decease, 17th March 180, he manifested a shameful eagerness to plunge into the dissipations of Rome. At that period he was successfully fighting the Marcomanni and other tribes on the Upper Danube, and, not to be balked of his anticipated pleasures, he hastily concluded a treaty with the barbarians, and, reached the capital in the beginning of the autumn. The cruelty to which he was always prone, was especially called into action after a conspiracy by his sister Lucilla against his life had been discovered in the year 183. Nearly all who, by virtue, ability, and learning, had risen to honor during his father's lifetime, were sacrificed to appease his savage jealousy of the good and the great. Gross prodigality in the expenditure of the resources of the state on the amusements of the amphitheater also marked his reign. He was proud of his own physical strength, and exhibited it in gladiatorial combats. For each of these exhibitions, he charged the state an enormous sum. He used also to sing, dance, play, act the buffoon, the peddler, or the horse-dealer, and engage in all the filthy and horrible orgies of Egyptian sacrifice. A glutton, a debauchee, who wallowed in the most sensual abominations, he yet demanded to be worshiped as a god, and assumed the title of Hercules Romanus. Many plots were devised against the life of this mingled monster and madman, and at last one of them accomplished its purpose. His mistress, Marcia, in concert with the prefect Laetus and the imperial chamberlain Eclectus, after they had failed in an attempt to poison him, caused him to be strangled by Narcissus, a famous athlete, on the 31st of December, 192.

CO'MMON, in Law. This is one of the numerous instances in which a different meaning is attached to the same term in the legal systems of England and Scotland. In England, a C., as defined by Blackstone, is 'a profit which a man hath *in the land of another*, as to feed his beasts, to catch fish, to dig turf, to cut wood, or the like.' In Scotland, again, where the law has adopted the divisions, and followed the nomenclature of the civil law, and of the legal systems of continental Europe, all these profits, or rights to derive profit, are known as *Servitudes* (q. v.), whereas a C., or Commonty, as it is more frequently called, is a common right of property existing in several individuals, frequently the inhabitants of a whole village, in a piece of ground. In each individual, the right of course is limited, so as in reality to amount to little more than a servitude; but there is no over-lord, the land is not the land of another, but the land of the community as a body.

The division of C. lands, or those over which C. is claimed among the parties possessed of such rights, or the permission to the owner to enclose the lands or making compensation to the owners of C. rights, has been the subject of regulation by a very great number of statutes. Many of these are private acts, but the 6 and 7 Will. IV. c. 115 laid down general rules for effecting the purpose in future, without the necessity of obtaining an act of parliament, where the consent of two-thirds of the parties interested could be obtained, and the C. to be enlosed lay more than ten miles from London, and a specified distance from any other large town. By a subsequent statute (8 and 9 Vict. c. 118, amended by several later acts), a Board of Commissioners (see Enclosure Commissioners) is appointed to inquire into the propriety of any proposed enclosure or partition, and to report to parliament, which then may pass a public act authorizing the proceedings. This is the course generally adopted.

In Scotland, *commonties* or commons were made divisible by an action in the Court of Session, at the instance of any having interest, by the stat. 1695, c. 38.

On the subject of enclosing commons, Mr. J. S. Mill (*Dissertations and Discussions*, vol. ii. p. 213) expresses the following decided opinion: 'We must needs think, also, that there is something out of joint, when so much is said of the value of refining and humanizing tastes to the laboring-people—when it is proposed to plant parks and lay out gardens for them, that they may enjoy more freely nature's gift alike to rich and poor, of sun, sky, and vegetation; and along with this a counter-progress is constantly going on of stopping up paths and enclosing commons. Is not this another case of giving with one hand and taking back more largely with the other? We look with the utmost jealousy upon any further enclosure of commons. In the greater part of this island, exclusive of the mountain and moor districts, there certainly is not more land remaining in a state of natural wildness than is desirable.

'Those who would make England resemble many parts of the continent, where every foot of soil is hemmed in by fences and covered over with the traces of human labor, should remember that where this is done, it is done for the use and benefit, not of the rich, but of the poor; and that in the countries where there remain no commons, the rich have no parks. The common is the peasant's park. Every argument for ploughing it up to raise more produce, applies *à fortiori* to the park, which is generally far more fertile. The effect of either, when done in the manner proposed, is only to make the poor more numerous, not better off. But what ought to be said when, as so often happens, the common is taken from the poor, that the whole or great part of it may be added to the enclosed pleasure-domain of the rich? Is the miserable compensation, and though miserable not always granted, of a small scrap of the land to each of the cottagers who had a goose on the common, any equivalent to the poor generally, to the lovers of nature, or to future generations, for this legalized spoliation?'

COMMON, Tenancy in. This is an Estate (q. v.) or a right in property accruing to two or more persons; and the nature of it is, that each has a distinct right to his own share, although no division has yet been made. But the common owners may agree to a partition, or one of them may, in equity, compel a partition. If the estate is one which passes by inheritance, the heir of each owner takes his share, and there is no benefit of survivorship. A tenancy in C. may be created either by a conveyance in express words, or by the parties obtaining their titles at different times, or at the same time from different parties. But if the title accrues

by descent from the same ancestor, even though at different times, it is a tenancy in Coparcenary (q. v.).

COMMON BENCH. See BENCH and COMMON LAW, COURTS OF.

COMMON CHORD. See CHORD.

COMMON COUNTS. Short formal statements of the cause of action made in a Declaration (q. v.).

COMMON DEBTOR. See DEBTOR and CREDITOR.

COMMON FORMS are the ordinary clauses used in writs and deeds in England. It has been attempted to substitute, for some of these, short expressions conveying all the meaning of the C. F.; but the statutes by which the attempt was made (8 and 9 Vict. c. 119 and c. 124), being permissive merely, have as yet not affected practice. A main reason for the preservation of C. F. was the general rule that conveyancers were paid not according to value, or the difficulty of their task, but according to the length of a deed. A statute of the session (23 and 24 Vict. c. 145) made a further effort to abolish the C. F. used in appointing trustees, &c., by giving to them the powers which were formerly contained in the common forms. Brevity, however, gains ground.

COMMON GOOD. See CORPORATION.

COMMON HOUSE, or COMMON ROOM, was an apartment in a monastery in which a fire was constantly kept burning for the use of the monks, who frequently were allowed no fire anywhere else. The C. H. was presided over by a monk, who was called the master. It was the prototype of the common rooms in the colleges and halls of the English universities.

COMMON LAW, in England. These words, in their proper sense, signify the ancient consuetudinary law of England. The C. L. is therefore distinguished from the statute law and from equity. It is wholly overruled by the statute law. On the 2d November 1875, the C. L. courts were merged in the Supreme Court of Judicature by the act of 1873 (see COURTS OF COMMON LAW), with a view to incorporate equity also, when the two systems conflicted. Accordingly, the old relation between law and equity subsists, and the former maintains its force in spite of any discordant rules of equity, which can therefore now take effect through the intervention of a court by which the C. L. is in each particular case corrected or superseded. For an enunciation of cases in which this result is shown, the reader is referred to the article under the heading EQUITY.

The C. L. is, in one sense, an unwritten law. Its rules have been handed down by tradition, sometimes in a complete and definite shape, such as the law of primogeniture, the jurisdiction of the courts, &c.; sometimes as a mere spirit or tendency, according to which, in novel cases, as they may arise, the law is to be expounded. Thus, the law-merchant is chiefly part of the C. L., although only some of its rules are of real antiquity, and the greater portion of them were developed no later than the last century. Therefore, in such cases, the C. L., though accounted traditional, is expanded by the judges who declare it, who enounce new rules suited to new combinations of circumstances, and merely bearing an analogy to what the ancient C. L. had established in cases which fell within its purview. It is therefore not wonderful that there should frequently be dispute as to what the C. L. is, and that different courts should occasionally give different decisions upon such questions.

As the C. L. has never been formally enacted, nor has yet been reduced to a regular code, it is to be sought for in the treatises of institutional writers, and in the decisions of the courts of law. These last are of the highest authority, and where they are consistent, they are taken as irrevocably establishing the law. But being declarator merely, and not imperative, a single judgment of a court is not held conclusive upon courts of equal jurisdiction, though it is commonly accepted as binding by inferior courts.

A court may even depart from its own decision, if it shall come to be of opinion that the law has been incorrectly stated. But this principle perhaps undergoes an exception in the House of Lords, which being the highest court of all, it is laid down by some of the law peers that its judgments have the force of statute, and that the rules it has once sactioned can be altered only by statute. The point has long been regarded as settled; and it is almost the only correct theory on which a court of supreme jurisdiction, like the House of Lords, can continue to exercise its functions.

The C. L. is applicable to the whole realm, but it is part of its principles, that in particular circumstances it may recognize rules which are not of universal application; thus, in certain courts, it adopts as its own the provisions of codes which it entirely rejects in other courts. The civil and canon law are in some of their rules recognized as part of the C. L. in the Maritime and Ecclesiastical Courts (including under the latter denomination the new courts of Probate and Divorce), but they are of no authority otherwise in the courts by which the main branches of the C. L. are administered. So also, in particular localities, customs exist which the C. L. sanctions, although they may be at variance with its general provisions. Such are the rules regarding succession which prevail in Kent under the name of Gavelkind (q. v.), and in certain towns under the name of Borough English (q. v.). But customs of much more circumscribed operation are, when proved, equally accepted by the C. L. as part of itself within the limits in which it prevails; for the C. L. deems it not inconsistent to adopt a contrary rule to its own, if clear and uniform and confined to one locality. In order to entitle a custom to the force of law, it must be of such endurance 'whereof the memory of man runneth not to the contrary.' The period thus indicated is more precisely defined as extending to the commencement of the reign of Richard I. By this is meant, however, not that the custom must be proved to have been in perpetual vigor since that remote epoch, but that proof of its non-existence within that period will invalidate it. If no such proof is adduced, the custom will be established by the evidence of experienced living witnesses, or by such documentary evidence as is inconsistent with any other assumption.

COMMON LAW, COURTS OF. These are generally divided into Superior and Inferior. The superior sit at Westminster, and hence are often called the Courts at Westminster. They had the names of the Court of Queen's Bench, the Court of Common Pleas or of Common Bench, and the Court of Exchequer. These are all offshoots of the great court, the *aula regia* of the early Norman kings, which, under the presidency of the chief-justiciar, and composed of the great officers of state and of the household, of the principal nobility, and of the justices learned in the law, attended the king's person wherever he went, and formed the sole superior court of the kingdom. But the inconvenience attending so transitory a judicature led to the demand, conceded in Magna Charta, c. 12, that *communia placita*, common pleas, should be held in a fixed place, and hence arose the establishment of the court of that name. Afterwards, under Edward I., the office of chief-justiciar was abolished, and the judicial functions of the aula regia partitioned among the Court of Chancery and the three courts of C. L. above named. In 1873, the Judicature Act, 36 and 37 Vict. c. 66, was passed, which rearranged all the Superior Courts in England, consolidating them into one Supreme Court of Judicature, but having five divisions called the High Court of Justice. Three of these divisions were called the Queen's Bench division, the Common Pleas division, and the Exchequer division, respectively. The kind of business dealt with in each division was substantially the same as under the previous arrangements, the chief difference being the new names of the courts and the principle now common to them all, that thereafter they should administer justice without distinction as to its being theretofore known as Common Law or Equity. In 1881 it was further resolved that the offices of Chief-justice of Common Pleas and of Chief-baron of Exchequer should be abolished, and the three Common Law divisions consolidated. The Common Pleas and Exchequer have accordingly disappeared from the list of divisions of the High Court of Justice; and Queen's Bench, presided over by the Lord Chief-justice of England, has now not four but fourteen puisne justices. The former distinctions existing in the jurisdiction of the courts may still be briefly indicated under the head of each court.

1. *Court of Queen's Bench.*—This court was composed of the Chief-justice of England, and five puisne judges or justices. Its peculiar powers lay chiefly in the exercise of supervision over the proceedings of inferior courts and magistrates to the effect of restraining them from exceeding their jurisdiction, or of compelling them to perform their duty, and in the control of corporations in the event of illegal procedure, and in criminal jurisdiction.

2. *Common Pleas.*—This court retained exclusive jurisdiction over real actions so long as they existed, but latterly it held but few peculiar powers. A remnant of its original authority was reserved to it in the disposal of the actions which came in lieu of the old writs of dower to this court, and in the rule that certain deeds affecting land must be registered here. This court was also the court of appeal from the revising Barristers (q. v.). There was a Chief-justice of Common Pleas, and five puisne justices.

3. *Exchequer.*—This court possessed exclusive authority in all matters relating to the revenue. It was at one time a court of equity, as well as of common law, but the equity branch was abolished by 5 Vict. c. 5. It was composed of a chief-baron and 5 puisne barons.

The Chief-justice is appointed by the crown; the puisne judges, by the Lord Chancellor. The salary of the Lord Chief-justice of England is £8000; and that of the puisne judges, £5000 per annum.

The Queen's Bench used to sit also as a Bail Court (q. v.). The appeal formerly from these courts was to the Exchequer Chamber and thence to the House of Lords. But now the appeal is to Her Majesty's Court of Appeal in the first instance, and thence to the House of Lords. This last court of appeal consists of the Lord Chancellor and the Lords of Appeal appointed to sit as peers; and

it may besides include those peers who hold or have held high judicial offices in England, Scotland, or Ireland.

The sittings of the above superior courts are held only during Term (q. v.), when they are said to sit *in Banc* (q. v.), and decide on all questions of law that may arise in the actions brought before them. But questions of fact, unless both parties decide to leave them to the decision of the court (17 and 18 Vict. c. 125, s. 1), are decided by a jury, and the courts in which they are tried are held out of term-time, before one or two judges only, not necessarily of the court to which the action belongs. These trials take place either on Circuit (q. v.), or at the London and Westminster sittings, which are in or after ever term, and in either case are called trials at *nisi prius*. The verdict is returned to the court to which the action belongs, by which it is disposed of according to law.

The authority of the superior courts of C. L. extends over the whole of England, and over common law rights of every description. But since the remodelling of the county courts, it has been enacted by several statutes, with a view to discourage resort to such high judicatures in trifling cases, that in some species of actions in which less than £20, and in other species in which less than £5 shall be recovered, in the superior courts, no costs shall be allowed the plaintiff, unless the judge who tries the case shall certify that there was sufficient reason for its being brought in the superior courts.

The inferior courts are restricted both in respect of place and matter. They were extremely numerous, but now nearly all have been formally abolished; but they are now with few exceptions—the principal of which is the modern County Court (q. v.)—matter of interest to the antiquary rather than either to the practical lawyer or the public. They may therefore be passed over with very brief explanation.

The *Court Baron* was a court composed of the tenants of each lord of a manor. It might decide on all real actions (now abolished) arising within the manor, and on personal action below the value of 40*s*. but subject to review by the court at Westminster. In a manor comprising Copyholds (q. v.), it is still of importance. The *Hundred Court* was a similar court, composed of the freeholders within the Hundred (q. v.), and had like powers with the Court Baron. The Court of *Pie Poudre*, or dusty foot, was held by the steward of a manor to which a market belongs, for the decision of all questions of bargaining at the markets. The *Forest Courts*, of several classes, were for the preservation of the beasts of the chase, and the protection of the subject from oppression by the officers of the forest. The *Courts of Requests* in boroughs were for the recovery of small debts, but are now abolished.

A few *Borough Courts* still exist, and are held under the presidency of the Recorder (q. v.). From them a writ of error lies to the superior courts. The *Lord Mayor's Court*, and the *City Court* in the city of London, have a considerable amount of business. The *Court of Hastings* in London is practically obsolete. The *Court of the Cinque Ports* is held before the mayor and jurats of each port, from which error lies to the Lord Warden of the Cinque Ports Court at Shepway, and thence to the Queen's Bench. The *Stannary Courts* in Cornwall and Devonshire are also still in use, and exclude, as to the tin-workers, the jurisdiction of all the other courts, except in pleas of land, life, or member. They are held before the vice-warden of the Stannaries, and appeal lies only to the warden, assisted by two of the judges; and thence to the High Court (2 and 3 Vict. c. 58, 18 and 19 Vict. c. 32, and 32 and 33 Vict. c. 19). There are in some counties also *Barmote Courts*, for regulating questions relating to the mines (14 and 15 Vict. c. 94). The Courts of the Chancellors of the universities of Oxford and Cambridge have also exclusive jurisdiction (except as regards freeholds), where the defendant is resident in the town, and a scholar or privileged member of the university is a party.

The Court of Common Pleas in Lancaster, and the Court of Pleas in Durham, have jurisdiction in all personal actions, and now form part of the High Court of Justice.

COMMON LAW BAR, that portion of the English bar which devotes itself to practise in the common law courts, distinguished from the equity bar, which practises only in the Courts of Chancery.

COMMON LODGING-HOUSES. See LODGINGS.

COMMON PLEAS. See COMMON LAW, COURTS OF.

COMMON PRAYER-BOOK. This book contains the forms of public worship and administration of the sacraments and other rites and ceremonies according to the use of the United Church of England and Ireland. It is, for the most part, a translation of such portions of the services of the ancient Catholic Church as were considered by the Reformers free from all objection. Before the Reformation, the liturgy was in Latin, and the form generally adopted in the south of England was that after the use of Sarum. The first steps towards its reformation were taken by Henry VIII., the main objects in view being the abolition of what was superstitious, and the translation of the services into the vulgar tongue. In the year 1540, a committee of bishops and divines was appointed for the purpose, and what was done by them was revised by convocation in 1543. In the year 1545, the *King's Primer* came forth, containing, amongst other things, the Lord's Prayer, Creed, Ten Commandments, 'Venite,' 'Te Deum,' Litany, and other hymns and collects in English, several of which were in the same version as at present used. It was, however, in the reign of Edward VI. that the most important steps were taken for framing a new service-book. In opposition to the practice introduced by the Roman Catholic Church, an act of parliament was passed, ordering the communion to de administered to the laity in both kinds, and a formulary was drawn up for this purpose, and used at the end of the Latin mass. In the following year, a complete service-book was drawn up, including offices not only for Sundays and holidays, but for the administering of baptism and confirmatiou, for matrimony, the burial of the dead, and other occasions, together with the above-mentioned office for the communion considerably altered. This book was compiled by Cranmer and Ridley, assisted by eleven other divines; it was revised by convocation, and confirmed by king and parliament, and published in 1549, and is known as the FIRST PRAYER-BOOK of Edward VI. It differed from the one now in use by beginning the daily service with the Lord's Prayer, by retaining prayers for the dead, and directing the use of the sign of the cross in confirmation and visitation services, and the anointing of the sick. It was drawn up with great prudence, retaining as much, and altering as little as possible of what had been familiar to the people. In 1550, the ordination service was added, taken principally from that used by the Roman Catholic Church, but omitting certain ceremonies, and adding most of the questions proposed to the candidates. This service differed but little from that now in use, as authorized in 1662.

In 1551, objections, as might be expected, were made from various quarters to this *first* prayer-book, and Cranmer proposed to revise it, and called to his assistance two distinguished foreign reformers—Martin Bucer, and Peter Martyr. In this revision, some of the principal alterations were the addition of the opening sentences, the exhortation, confession, and absolution at the beginning of the service, the disuse of oil in baptism, of unction of the sick, and of prayers for the dead. The book thus altered was confirmed by act of parliament in 1552, and is called the SECOND PRAYER-BOOK of Edward VI.

In the reign of Queen Mary, the acts of 1549 and 1552 were repealed, and therefore, at the accession of Elizabeth, it was neccessary to reverse this repeal; and this afforded a fresh opportunity of revising the whole. The question then arose (1560) as to which of King Edward's two books should be adopted. The queen herself would probably have preferred the first, as containing many of the old ceremonies to which she was attached, but the second was chosen, and a few unimportant changes introduced. This may be called the THIRD COMMON PRAYER-BOOK. No alteration was made by it as to the use of church ornaments and vestments, which were directed by the act of uniformity, 1559, to be retained as they were left by the authority of parliament in the second year of Edward VI.

On the accession of James I., after the Hampton Court Conference, the book was again revised; and a few judicious changes made, e. g., some forms of thanksgiving were added for special occasions, and the explanation of the sacraments by Dr. Overall after the catechism; midwives and laymen were also prohibited from baptizing. In this state, the C. P. was left until the Restoration, when, at the request of the Presbyterians, the king consented to a fresh revision, 1661. Twelve bishops were appointed to confer with an equal number of Presbyterian divines, each side having nine coadjutors. They were to consider the principal objections raised against the liturgy as it then stood. This was called the Savoy Conference. The Presbyterians brought forward all the objections that had been made by the Puritans for the last century, adding new ones of their own. Baxter went so far as to say that it was incapable of amendment, and was bold enough to offer an entirely new liturgy of his own composition to be received in the place of the authorized one. It is hardly necessary to add, that the conference broke up without anything being done, except that the bishops proposed a few alterations, which were adopted by convocation in 1662, and confirmed by act of parliament. Among these changes, the new authorized version of the Scriptures was adopted, except in the psalms (which follow the version of Coverdale's Bible, and had become familiar to the people), and in the commandments and the sentences at the communion service; the general thanksgiving was added, and the form of prayer to be used at sea. It is proper to observe that the four forms of prayer known as the *State* Services—viz., for Gunpowder Treason, on November 5; for King Charles's Martyrdom, January 30; for the Restoration, May 29; and the King's Accession; were never properly a part of the C. P., but were annexed to it by order of the king in council at the beginning of every reign. Upon an address of both Houses of Parliament, in con-

formity with the wish of the clergy, an order in council was given by Queen Victoria for discontinuing the first three.

There have been four acts of uniformity—viz., in 1548 and 1552, both of which were repealed by that of Elizabeth in 1559; and the last in the 14th year of Charles II., 1662, which left that of Elizabeth unrepealed. In the Great Rebellion, 1643, the Long Parliament prohibited the use of the common prayer-book. At the Revolution in 1688, no change was introduced into the prayer-book; for although a commission was appointed for the purpose, the second downfall of Episcopacy in Scotland in 1689 caused such alarm in the English Church that the matter was dropped.

Concerning the use of the English C. P. in Ireland, it is sufficient to say that, in 1551, the first prayer-book of Edward was introduced by the king's authority, after some opposition; and the same prayer-book continued to be used on both sides of the Channel till the Irish branch of the United Church was disestablished. In 1875, the General Synod of the Church of Ireland adopted a Revision of the C. P., but without essential alteration. In Scotland, which had as yet no settled liturgy, Laud attempted to introduce the English prayer-book, but with alterations in the communion service which were likely to be very offensive to a people so hostile to the Church of Rome. This attempt was followed by riots, and ultimately led to the abolition of the Scotch Episcopate and to the Solemn League and Covenant. The English C. P. is now used in most of the Episcopal churches in Scotland, but in some a liturgy resembling that of Laud, but framed by the Nonjurors more on the model of the Eastern liturgies, is used in the communion service. In the United States, also, the English C. P. is used with some slight changes.

COMMON SENSE, The Philosophy of. There are certain beliefs that have been current among men in all ages, which, when canvassed by one set of philosophers, have been declared to be groundless illusions. Of these, the most remarkable instance is the belief in an external, material world, independent of any mind to perceive it. The doctrine put forth by Bishop Berkeley, as opposed to the common opinion, was, that 'the whole universe subsists, and can only subsist, within such a sentient, invisible, and conscious thing as the mind is known to be. In this way, each human mind must have within it a separate universe of its own, but so exactly the same in all minds, that every object of sense, and every movement of every object that is to be found in the universe of one mind, is to be found also in the universe that is within the other mind; the general effect of all which conditions is much the same as that which would be produced if several people were all dreaming, exactly at the same time, exactly the same dream.' 'The result of Berkeley's inquiry,' says Dr. Reid, 'was a serious conviction that there is no such thing as a material world—nothing in nature but spirits and ideas; and that the belief of material substances, and of abstract ideas, are the chief causes of all our errors in philosophy, and of all infidelity and heresy in religion.

His arguments are founded upon the principles which were formerly laid down by Des Cartes, Malebranche, and Locke, and which have been very generally received. And the opinion of the ablest judges seems to be, that they neither have been nor can be confuted; and that he hath proved, by unanswerable arguments, what no man in his senses can believe. Hume proceeds upon the same principles, but carries them to their full length; and as the bishop undid the whole material world, this author, upon the same grounds, undoes the world of spirits, and leaves nothing in nature but ideas and impressions, without any subject on which they may be impressed.'—*Inquiry into the Human Mind*, c. 1, s. 5.

A dead-lock in philosophy was the result of those doctrines of Berkeley and Hume; and the solution offered by Reid consisted in setting up C. S. as an arbiter from which there could be no appeal; that is to say, the universally admitted impressions of mankind were to be taken as corresponding to the facts of things without any further scrutiny. Reid's philosophy of C. S. has thus found a place in the thinking-world; and it is only the same view otherwise expressed, when it is declared by other philosophers that the deliverance of consciousness must be presumed true. Sir W. Hamilton, in the most elaborate vindication of the C. S. philosophy that has ever been produced (edition of Reid's works), dwells largely upon this last view of the subject. The following extract is a specimen of his mode of reasoning: 'When, for example, consciousness assures us that, in perception, we are immediately cognizant of an external and extended *non-ego* (not-self); or that, in remembrance, through the imagination, of which we are immediately cognizant, we obtain a mediate knowledge of a real past; how shall we repel the doubt—in the former case, that what is given as the extended reality itself is not merely a representation of matter by mind; in the latter, that what is given as a mediate knowledge of the past, is not a mere present phantasm, containing an illusive reference to a real past? We can do this only in one way. The legitimacy of such gratuitous doubt necessarily supposes that the deliverance of consciousness *is not to be presumed true*. If, therefore, it can be shown, on the one hand, that the deliverances of consciousness must philosophically be accepted *until* their certain or probable falsehood has been positively evinced; and if, on the other hand, it cannot be shown that any attempt to discredit the veracity of consciousness has ever yet succeeded; it follows that, as philosophy now stands, the testimony of consciousness must be viewed as high above suspicion, and its declarations entitled to demand prompt and and unconditional assent.'

'In the first place, it cannot but be acknowledged that the veracity of consciousness must at least, in the first instance, be conceded. Nature is not gratuitously to be assumed to work, not only in vain, but in counteraction of herself.' 'But in the second place, though the veracity of the primary convictions of consciousness must, in the outset, be admitted, it still remains competent to lead a proof that they are undeserving of credit. But how is this to be done? As the ultimate grounds of knowledge, these convictions cannot be redargued from any higher knowledge; and as original beliefs, they are paramount in certainty to every derivative assurance.' 'It will argue nothing against the trustworthiness of consciousness, that all or any of its deliverances are inexplicable—are incomprehensible. To make the comprehensibility of a datum of consciousness the criterion of its truth, would be indeed the climax of absurdity.' (P. 745.)

The conclusiveness of this reasoning is disputed by many, who object, that conciousness (q. v.) is a very wide word, comprising indeed everything that we call mind; and it is proverbially unsafe to argue in generalities. Suppose, it is argued, we were to substitute 'memory' in the above reasonings, and to maintain that the veracity of each one's memory was beyond all question or dispute, it would be apparent at once how the case really stands. In one meaning, and in one set of circumstances, memory is sure, or even, if we please, infallable—that is, when we record an observation the moment after we have made it. For a short interval of time, a simple fact, or a brief statement, may be recollected with entire certainty. On the other hand, the lapse of days, months, or years, and the complicacy of the fact, not to mention the bias of the feelings, are known to cause great uncertainty in our recollections, and in such circumstances we do not implicitly rely on it. In a word, *experience* is the criterion of how far the memory is to be trusted. Possibly, therefore, the same thing may turn out to be true of the larger fact named consciousness.

The truths of C. S., or consciousness, are such as these: the laws of Identity, Contradiction, and excluded Middle (see Identity); the axioms of Mathematics; the law of Casuality (see Cause); the doctrine of an innate moral sense (see Ethics); the doctrines of man's Moral Liberty (see Free Will); the existence of an external world independent of every percipient mind. Such truths are designated by a variety of other names, with a view to contrast them with what we learn in the course of our education and contact with the world; they are termed Intuitions, Intuitive Cognitions, Instincts, Feelings, Beliefs, Principles, Ultimate or Primordial Elements, Truths, *à priori*, Transcendental Cognitions, Truths of the Reason, &c.—*Hamilton's Dissertations*, note A. The philosophy of C. S., as promulgated by Reid, bore reference especially to the denial by Berkeley of the received view of the material world—a subject which falls to be considered under Perception.

COMMON TIME, in Music, is that species of measure which contains two minims or two crotchets in a bar.

COMMONS, the dinner provided in English colleges and inns of court for their members. In the inns of court, it is provided only during term. Separate tables are appointed for the benchers (q. v.), for the barristers, and for the students and other members of the inn.

COMMONS, House of. See Parliament.

COMMU'NION signifies, in ecclesiastical language, that relation, involving mutual claims and duties, in which those stand who are united by uniformity of belief in one religious body or church. To exclude from this relation and its involved rights, is to *excommunicate*. The most visible symbol of this relation being the partaking together of the Lord's Supper, that rite is often called the Communion. See Lord's Supper.

COMMUNION SERVICE. See Common Prayer-book and Liturgy.

CO'MMUNISM, the name given to one class of the arrangements by which certain speculators have proposed to dispense with those laws of social and political economy which are supposed to keep society together, through the influence of the domestic affections and the spirit of competition, and to substitute in their stead a set of artificial rules for the government of mankind. The word Socialist has generally been applied to those who only propose to interfere with labor by abolishing competition and wages, leaving men to work under the influence of public spirit, and

making an equal division of the produce. See SOCIALISM. The term communist, on the other hand, has been applied to those who go a step further, and propose to abolish the relation of husband and wife, along with the system of domestic government which is founded on the parental authority. While Louis Blanc may be considered the head of the Socialists—though his ultimate aim was work according to capacity, and payment according to wants—the representatives of the Communists are Robert Owen, St. Simon, Fourier, Proudhon, and Enfantin.

Although we usually consider C. an especially French fallacy, the first consistent practical teacher of it was our own countryman, Robert Owen.

He published in 1813, *A New View of Society, or Essays on the Principle of the Formation of the Human Character and the Application of the Principle to Practice*—in which he printed in large capital letters, as the keynote of his system, the following announcement: 'That any character—from the best to the worst, from the most ignorant to the most enlightened—may be given to any community, even to the world at large, by applying certain means, which are to a great extent at the command and under the control, or easily made so, of those who possess the government of nations.' No alarm was felt either at such a text or the comments made on it; nor did the world see what the author meant by the hint that there were special artificial means for improving the breed, as it were, of mankind, until he struck at the root of the domestic organization, by such announcements as the following: 'The affections of parents for their own children are too strong for their judgments ever to do justice to themselves, their children, or the public in the education of their own offspring—even if private families possessed the machinery (which they never do) to well-manufactured character from birth.' He formed an organization, too complex to be here detailed, by which families were to be subjected to a discipline which, that it might be perfectly uniform, should be carried out in parallelograms. Anticipating the results, he said: 'These new associations can scarcely be formed before it will be discovered that by the most simple and easy regulations all the natural wants of human nature may be abundantly supplied; and the principle of selfishness—in the sense in which that term is here used—will cease to exist, for want of an adequate motive to produce it.' He attested his reliance on the efficacy of his invention by sinking his own fortune in an attempt to build a parallelogram. It was commenced in the year 1825, at Orbiston, in Lanarkshire; but he did not meet with sufficient co-operation, and as his own funds only sufficed to build one corner of the parallelogram, it was impossible to give effect to arrangements which were fitted only for a completed edifice in that geometrical form. A considerable number of people—about 200, it is said—lived for some time in the building, little to their own advantage or that of the neighbors, who were naturally prejudiced against them, and probably exaggerated their irregularities; the building was soon deserted, and afterwards was totally obliterated.

Owen had another opportunity of trying his parallelogram organization in 1843, when 'Harmony Hall' was established in Hampshire by the zealous efforts of his followers, who formed a sort of sect in England. Still his theory had, as he deemed it, anything but fair play, since so far did his disciples depart from that absolute undeviating conformity to the 'rational' system, as laid down by him, that they got tired of his incessant reiteration of it, and deposed him from his office of 'President of the Congress.'

Attempts to realize C. abroad were not more fortunate. Fourier's system was to be realized in 'phalanxes,' each containing 400 families, or about 1800 persons. A sum of about half a million of pounds is said to have been spent in the establishment of a 'phalanstery' at Rambouillet. It failed, and the founder of the system, like Owen, attributed the failure to the scheme being but imperfectly developed. The St. Simonians established a college or corporation at Menilmontant, with a 'supreme father' at their head. The leaders were brought to trial by the government of Louis-Phillippe, on a charge of undermining morality and religion. They were subjected to imprisonment, and not having public feeling with them, they were unable to bear up against the contumely thus thrown on them.

Communism, in the sense of having all things in common, is not to be confounded with the idea for which the communists of Paris fought in 1871 (see PARIS); that idea was political rather than social, although the same persons may often hold both doctrines. *Commune* is the designation of the lowest administrative division in France, corresponding in rural districts to an English parish or rather township, and in regard to cities, being equivalent to municipality. The communist doctrine is, that every such commune, or at least every important city commune, like Paris, Marseille, &c., should be a kind of independent state in itself, and France merely a federation of such states. This idea has taken deep hold of the extreme democrats, not only among the town populations of France, but also in Spain, and, to a less extent, in other parts of the continent. It was the very opposite idea for which the great civil war in the United States was fought and won.

COMMUTA'TION OF TITHES. See TITHES.

COMNE'NUS, the name of a family, originally Italian, of which many members occupied the throne of the Byzantine empire from 1057 to 1204, and that of Trebizond from 1204 to 1461. See BYZANTINE EMPIRE and TREBIZOND.—ANNA COMNENA (q. v.), who lived in the first half of the 12th c., is both of historic and literary celebrity.—DAVID C., the last representative of the imperial race in Trebizond, was executed at Adrianople in 1462, with all his family, by command of Mohammed II. The attempt which has been made to trace the descent of the Bonaparte family from a branch of the Comneni settled in Corsica, is not supported by valid evidence.

CO'MO, a city of Lombardy, Northern Italy, beautifully situated at the south-west extremity of the Lake of Como. It lies in a valley, surrounded by hills, clad with luxuriant gardens, olive-plantations, and orange-groves, with here and there an old ruin cropping out. The city is surrounded by old walls flanked with towers, the gateways by which the walls are pierced being fine specimens of middle-age military architecture. Among the principal buildings of C. are the cathedral, built of marble, and containing some interesting pictures and monuments; the town-hall, also of marble, dating from the beginning of the 13th c.; and the churches of San Fedele and St. Abondio. There are also many fine mansions of the nobility in C. and its suburbs. The port of C., on the lake, is formed of two piers, each terminating in a square pavilion, from which magnificent views are obtained. The inhabitants—including the suburbs—number (1881) 25,560, and are very industrious. The chief articles of manufacture are silk, cotton, woollens, yarn, and soap, the last article having a high reputation. By means of its port, C. carries on extensive trade in the produce of the district with Switzerland. C., in the time of Pliny the Younger, had attained to a high degree of prosperity as *Comum Novum*. With the fall of the Roman empire, C. passed out of sight until 1107, when it began to war with Milan, and in the course of twenty years was utterly destroyed by its antagonist. It was rebuilt in 1155, by Frederick Barbarossa, and remained a republic for two centuries, when it fell into the hands of the Viscontis, its history since that time being bound up with that of Milan.

COMO, LAKE OF (Ital. *Lago di Como*, ancient *Larius Lacus*), a sheet of water in Lombardy, Northern Italy, lying at the foot of the Lepontine and Rhetian Alps, chiefly formed by the river Adda, which enters it at its north, and issues at its south-eastern extremity. The total length of the lake from Como to Riva is about 35 miles. About 15 miles from its northern extremity, the promontory of Bellagio divides it into two branches, the longer of which is between 18 and 20 miles; the other branch is about 12 miles long. The three arms of the lake sometimes receive different names—the upper part as far as Bellagio being called the Lake of Bellano; the longer branch, on which the town of Como is built, the Lake of Como; and the shorter, the Lake of Lecco. Lake Como, however, is the general designation. The greatest breadth of the lake is not more than 3 miles, but throughout the greatest part of its length, it is much less. The beauty of the surrounding scenery, and the salubrity of the climate, have made the Lake of C. the most celebrated and most resorted to in Italy, its shores being everywhere studded with fine villas. Queen Caroline once had a residence here. Numerous steam-boats ply upon the lake.

COMODO', an island in the Eastern Archipelago, 35 miles in length, by 16 in average breadth, lies between Flores on the east, and Sumbawa on the west, being separated from the latter by the Strait of Sapi. It is a penal settlement of the kingdom of Bima in Sumbawa. The exports are dried fish and good grinding-stones.

COMORI'N, CAPE, the most southerly extremity of the peninsula of Hindustan, being, in fact, a sandy accretion to the termination of the Western Ghauts; while, on the outside of it, are a few detached rocks as a natural breakwater. The headland itself is so low as not to be visible at the distance of more than ten miles from the deck of a large ship; and, long before it can be itself distinguished, it is fixed in position, to the eye of the approaching mariner, by a conspicuous peak of the great chain behind it. Its lat. and long. are 8° 5′ N. and 77° 37′ E. Cape C. is in the protected principality of Travancore; and close to it there stands, amid a clump of trees, a village of the same name, with a few fishermen's huts, some venerated temples, and a Dutch church.

CO'MORN, properly KO'MORN, a town and fortress in Hungary, situated on the island of Schütt, at the junction of the Waag and the Danube, which is here crossed by a bridge of boats, about 50 miles west-north-west of Pesth. This island is remarkable for fertility, as is, indeed, the whole surrounding district. The town.

which is irregularly built, with narrow gloomy streets, contains (1880) 13,108 inhabitants, almost exclusively Magyar. The fortress was erected by Matthias Corvinus, and was restored at great expense in 1805. Its works and intrenchments extend about seven miles along the banks of the rivers, and it requires for its defence at least 15,000 men and 400 pieces of artillery. It has the reputation of being impregnable, and justified it in the Hungarian war, for the Austrians besieged it in vain from October 1848 to September 1849, and only became masters of it at last in virtue of a capitulation. It has manufactures of woollen and leather, and an active trade in corn, wine, honey, fish, and timber.

CO'MORO ISLES, a group of four islands in the Mozambique Channel, between Africa and Madagascar, in lat. 11°—13° S., long. 43°—45° 30′ E. The islands, which are of volcanic origin, are called Angaziya or Great Comoro, Anjouan or Johanna, Mayotta, and Mohilla. They are mountainous, the highest peaks rising above 6000 feet. The soil is fertile. The inhabitants, about 80,000 in number, are principally Mohammedans, but fetichism prevails to some extent. The manufactures are coarse cloths, jewelry, and firearms. The island of Mayotta was ceded to France in 1842, and the cession was confirmed in 1845. The total exports (mostly sugar) have an annual value of from £30,000 to £50,000; the imports, of £20,000 to £30,000. Great Comoro, which has an active volcano, suffers from want of water. The people of Johanna find their principal employment in connection with ships calling for provisions. The trade of Comoro and Mohilla is of the same character, but these islands are not so much frequented by ships for the purpose of victualling.

COMPANIES' CLAUSES CONSOLIDATION ACT. See RAILWAYS.

CO'MPANY. See JOINT-STOCK COMPANY and PARTNERSHIP; see also GUILDS, LIVERY.

COMPANY, in Military Organization, is an aliquot part of a regiment or battalion. In the British service, the companies in an infantry regiment are generally either ten or twelve, or, if there are two battalions, each has this number of companies. The arrangement is made to facilitate command and evolutions. The captains, lieutenants, and sub-lieutenants are all *C. officers*. The captain is the chief of a C., and the lieutenant and sub-lieutenant are his subalterns or assistants. The C. is further separated into two *subdivisions*, of two sections each. In round numbers, and without reference to special instances, a full C. may be considered to comprise about 100 men, a subdivision 50, and a section 25. Under the captain's superintendence, the lieutenant commands the first and second divisions, the sub-lieutenant the third and fourth, with a sergeant to each section. Each C. has its own arm and accoutrement chests, and keeps its own books. A cavalry regiment is subdivided into *troops* instead of companies; the engineers and marines into companies; but the artillery corresponding term is *battery*. In the German army, a company comprises about 250 men, under a captain, who is a mounted officer, and 3 subalterns.

COMPANY, of a ship, is considered to include the whole of the persons engaged on board, and paid for specific duties—exclusive, therefore, of troops and passengers, but including naval officers as well as crew. See CREW.

COMPA'RATIVE ANA'TOMY. See ANATOMY.

COMPA'RISON, in Grammar, and as applied to Adjectives (q. v.), is that which marks the *degree* in which the quality is attributed to the object, as compared with other objects. There are three degrees of comparison. The *positive* indicates the quality generally, without comparison; the *comparative*, a higher degree of the quality than is attributed to other things; and the *superlative*, the highest degree that is attributed to any of the things under consideration. There are two ways of expressing these degrees. 1. By an inflection or change on the word; as, *hard, harder, hardest; happy, happier, happiest.* This mode prevails almost exclusively in Greek and Latin. 2. By an additional word, as *more happy, most happy.* This may be called logical C.; the other, grammatical. In French, with the exception of a few irregular adjectives, all adjectives follow the logical method. In English, the logical method is preferred in every case where the grammatical would produce a word difficult or harsh in the pronunciation.

This is generally the case in English when the simple adjective is of more than one syllable; but it is not always so. Thus, *éarnester, prúdenter*, would make harsh combinations; not so *políter, discréeter, háppier.* The difference is, that in *éarnester, prúdenter*, the accent being on the first syllable, two unaccented syllables of discordant character are thrown together; in *políter, discréeter*, the unaccented syllables are separated; and in *háppier*, though they come together they are of a kind readily to coalesce. Thus, the laws of euphony—which mean, the ear and organs of speech consulting their own convenience—determine this point, as they do much else in language. In general, it is only adjectives of quality that admit of C.; and even adjectives of quality cannot be compared when the quality does not admit of degrees; as a *circular* space, a *gold* ring, a *universal* wish.

Adverbs (q. v.) are compared exactly like adjectives.

CO'MPASS, MARINER'S, is the name given to the instrument by which sailors are enabled to steer their course on the ocean out of sight of land, and when neither sun nor stars are visible. The ancients, to whom it was unknown, could seldom venture to lose sight of the coast. The directive power of the magnet seems to have been unknown in Europe till late in the 12th century. It appears, however, on very good authority, that it was known in China, and throughout the East generally, at a very remote period. The Chinese annals indeed assign its discovery to the year 2634 B.C., when, they say, an instrument for indicating the south was constructed by the Emperor Hou-ang-ti. At first, they would appear to have used it exclusively for guidance in traveling by land. The earliest date at which we hear of their using it at sea is somewhere about 300 A.D. According to one account, a knowledge of the C. was brought to Europe by Marco Polo, on his return from his travels in Cathay. It was long contended that the C., as a nautical instrument, was first invented by Flavio Gioja, a native of Amalfi, about the year 1362; and that that part of the kingdom of Naples where he was born has a compass for its arms. For

this there is no authority whatever, as the C. was well known as a nautical instrument before his time. It is probable, however, that Gioja may have made some improvement in the instrument or in the mode of suspending it. See *British Annual for* 1837.

The essential part of the C. is the magnetized needle, balanced freely upon a fine point; such a needle has the property of arranging itself in the meridian, one end always pointing to the north, and the other to the south (see MAGNETISM); yet not exactly, but with a deflection or *declination* (q. v.), which varies from time to time in magnitude, and may be towards the west or the east. The form of the needle is various, some being long flat prisms, others lozenge-shaped. The center of the needle is pierced, and a piece of agate generally inserted, with a conical hole sunk in it, to receive the fine point of the steel pin, so that the free motion may not be hindered by friction. The construction of the rest of the instrument depends upon the purpose it is to serve. For a mariner's C., the needle is fixed to a circular card, on which there is a star of 32 rays (see the figure), marking the 32 *points* of the heavens. The north point of the card is immediately over the north end of the needle, and the card moves with the needle. The cardinal points are marked with the letters N., S., E., W.; and the intermediate points, by an ingenious system of notation, the principle of which is readily seen by inspection of the figure. The points are often subdivided into quarters, which are thus marked: N.¼E. (read, 'north one-fourth east'); N.½E.; N. by E.¼E., &c. A point of the C., being $\frac{1}{32}$ of the circle, is equal to 11° 15′. The C. thus formed is enclosed in a cylindrical brass box; and in order that the C. may remain horizontal in all positions of the ship, the box is supended by Gimbals (q. v.). The whole is then placed in the Binnacle (q. v.), in sight of the helmsman. Inside the box, in the direction of the ship's bow, is a vertical black line called the *lubber-line*, and the steersman must keep the point of the card which marks the prescribed course always in contact with the black line. Compasses differing in some respects from the mariner's C. are also used in surveying and land-measuring; and for the minor they are perhaps as necessary as for the sailor.

The great difficulty connected with the use of the mariner's C. arises from the disturbing influence of the magnetism of the ship. This difficulty is particularly felt in iron vessels, where the deviation of the needle is frequently so considerable as to render the compass almost useless. Various means of obviating this have been suggested; one of these is to place bars of soft iron or magnets in the immediate neighborhood of the binnacle, which being so placed as to cause a contrary disturbance to that of the iron of

the ship, leave the needle comparatively free. This is found to answer well in iron ships plying between British and continental or North American ports; but where, as in the Australian passage, they change considerably their latitude, such an agreement is found to be worse than useless, as the magnetism of the vessel changing with the magnetic latitude, causes an ever-varying deviation of the needle. It has likewise been suggested to place a compass as a standard at the mast-head, where it would be comparatively free from the attraction of the vessel, by which the ship's course might be shaped, the ordinary C. being used merely to give immediate direction to the steersman. In the royal navy this error is to a large extent obviated in the followlng way. A C. is placed so high above the deck as to clear the bulwarks, and allow the bearings of a distinct object on shore or a heavenly body to be taken while the ship's head makes a complete circuit. In this way the deviation caused by the iron of the ship in all different positions may be ascertained, and afterwards taken into account.

COMPASSES, instruments for transferring and marking off distances, or for drawing circles, ellipses, &c. The *common C. or dividers* are simply two rods or 'legs' joined together at one end by a pivot-joint, and pointed at the other; when used for drawing circles, the lower part of one of the legs is replaced by a pen or pencil. *Spring dividers* are much in use by workmen; in these, the legs are united by a strong steel spring, the action of which is to stretch them open; but half-way down, a screw passing between the legs, regulates the degree of opening. The value of these depends upon the permanency with which they retain any degree of opening given to them, pivot C. being liable to slip.

Beam C. consists of points sliding on a long bar, to which they may be clamped at any distance from each other. They are used for greater openings than pivot C. can safely span, and, when delicately made, for more accurate dividing. See GRADUATION.

Proportional C. have a point at each end of each leg and the pivot between, thus forming a double pair of C. opposite to each other, end to end. If the pivot is midway between the points, the opening of each pair of points will be equal; if the distance from one pair of points be double that from the other, the openings will be as two to one; and so on for any ratio. When a single fixed proportion only is required, the pivot is fixed accordingly; but to adapt them for variable proportions, the pivot is a clamping screw, which moves in an elongated interval in the legs, and may be fixed at any point.

Triangular C. have three legs, so that the points of a triangular may be all transferred at once.

Calliper Compasses. See CALLIPERS.

COMPA'SSIONATE ALLOW'ANCE is an allowance made to the children of deceased British military and naval officers left in necessitous circumstances. The annuities vary from £8 to £20 a year, according to the rank of the deceased officer; and are tenable up to the age of 18 in the case of boys, and to that of 21 as regards females, or until marriage if that happen earlier. This measure is more general than a C.A. which arose out of the sympathy of the British nation with the army during the Crimean War. Royal warrants were issued in 1855 and 1856, defining and explaining allowances made to the widows and children, or other specified relations, of military officers who, after the date of the declaration of war with Russia, had been killed in action, or had died of wounds received in that war. The claims on this fund die out as years advance, of course.

COMPENSA'TION (Lat. *compensatio*). The doctrine of C., which the law of Scotland and of most of the other states of Europe have borrowed from the civil law of Rome, corresponds to that of *set-off* in England. It provides that where two parties are mutually debtors and creditors, their debts shall extinguish each other, if equal, and if unequal, leave only a balance due. C. must be pleaded, as it does not operate *ipso jure*, but, when pleaded, it is held to operate from the period of concourse, the interest on either side being stopped from that time.

Compensatio Injuriarum is a defence against actions of damages for slander or the like. It is not a bar to action, but a *set-off* or counter-claim. In England, it is not allowed to set-off one trespass or tort against another—a cross-action is requisite; and in Scotland, the leaning recently has been in the same direction.

COMPENSATION OF ERRORS, in Physics, a method of neutralizing errors which cannot be avoided, by introducing others into the experiment or observation, of an opposite nature, and equal in amount. The compensation pendulum illustrates the principle. See PENDULUM.

COMPETI'TION (Lat. a seeking together) has been well defined by Dr. Johnson as 'the act of endeavoring to gain what another endeavors to gain at the same time.' Its most apt exemplification is a race, where all are going to the same point, and all strive to be first there, while though only one can achieve this object, some others will have the satisfaction of being nearer to success than the competitors who are behind them. The most important practical use of the word C. is in the political economy of commerce, where it is the great motive-power of production and enterprise.

People work, or embark in trade, avowedly for the purpose of making money. It is the object of the law of the land, as well as of religion and morality, to prevent money-making by immoral means; but within the bounds thus drawn around it, money-making is the object of man's exertion. When the money is made, the next point, always within the same bounds, is to make it go as far as it will. C. works through the co-operation of these motives. The purchaser wants the best article he can get at the lowest price; the producer strives to beat all his fellows, and offer the best article for the price. So thoroughly is this principle established as one consistent with commercial morality and honor, that our railway companies, managed by men of rank and fortune, many of whom are members of the legislature, do not hesitate to make travelers pay a larger fare for going 20 miles on their line to a station not touched by a rival company, than they will charge the same passenger for a journey of 40 or 50 miles, if it be to a station which he could reach otherwise.

Whatever may be hereafter accomplished, what we chiefly know of the attemps to supersede C. by some other motive to exertion, is, that they have not been successful. We see every day C. increasing the necessaries and comforts of life, and enlarging the wealth of the community. It is said that there are other and better motives which should produce the same effect, but they have not yet been found. It was an object of the ruling party in the French provisional government of 1848 to abolish C., and place all workmen on a par, as some expressed it, or, according to others, to remunerate them, not according to their services, but according to their wants. A great experiment was tried at the Hôtel Clichy, where 1500 tailors were employed to make the uniforms for the national guards, the price of which was to be equally divided among the workmen; but even in that climax of enthusiasm, they did not work up to the mark of the lowest paid of the Paris tailors under the competitive system. As each one felt that the value of any extra exertion would be divided among the whole 1500, instead of being enjoyed by himself, his zeal relaxed, and even the thought of 'liberty, equality, and fraternity' was insufficient to rouse it. It appears wonderful that large bodies of the French people should have been so easily deceived by statements of which the fallacy, or rather the actual inaccuracy would be at once seen through by any working-man in this country. Louis Blanc supposes three competitors for a job. A has a wife and family; he wants 3 francs of wages. B has a wife only; 2½ francs will do with him. But C is a bachelor, who can subsist on 2 francs; therefore, he gets the job, and the others starve. See the second chapter of his *Organisation du Travail*, the title of which is, 'Competition is for the People a System of Extermination.' But he leaves out entirely one side of the bargain. Employers compete to get work as much as workmen compete for employment. If the work of B and C be worth, in the market, 3 francs, they will get that whether they have families or not, and it is not the practice of a working-man, any more than of the rest of the human species, to give his work at a third less than its value because he is a bachelor.

The Socialists have referred to the public departments—especially to the post-office arrangements in Britain—for instances of services performed without competition. There is, however, in reality, much C. in all the government departments. Although tradesmen may not endeavor to undersell each other by making goods and offering them to the government, yet they endeavor to undersell each other by offering to undertake contracts at the lowest price. Doubtless, the practice of entering on government-contracts is open to abuse, if the officers who look after them are careless, and neglect the detection of fraud or inefficiency. But the service of government by contract may be made as effective as any other kind of competition.

There are circumstances in which it is necessary to dispense with the external form of C., but where its influence still rules. For the convenience of the public—especially of travelers—rates of fares are established for cab-drivers, porters, ferrymen, and the like. These men cannot be forced to undertake such functions; they do so because it pays them. Instead of making a separate contract for each job—an arrangement open to fraud and inconvenience—they make a general bargain with the public to serve all-comers. The rate of remuneration they receive ought to be the closest possible approximation to what C. would fix. Whether it is so or not, can be easily tested. If men do not come forward in sufficient numbers to serve the public, then the fixed rate is too low; on the other hand, if there is a superfluity of hands, a percentage of them being at all times unemployed, it is clear that the rate is too high, and that even partial employment in the line is sufficient to induce men to leave other occupations.

One of the most plausible arguments against free C. is, that it throws away labor by producing more goods than are required. Five hundred hats are wanted, but a thousand are produced, and therefore half of them are wasted. In some such shape, the folly

and waste of C. are generally illustrated by continental writers. It is very rarely that dealers are so utterly blind to the demand for the article in which they trade. It must be admitted, however, that C., like all other useful things, has its peculiar abuses, and of these perhaps the chief is the propensity which some tradesmen have to carry rivalry to the extent of vicious excitement, and to endeavor rather to get the better of each other than to make their separate fortunes. From this spirit, it frequently happens that when one man has established a successful business in some new locality, another, instead of trying a different business in the same place, or the same business in some other and similar place, sets himself down as a rival, and ruins both. One sets up, for instance, a grocery-shop in a new suburb; he succeeds, but there is not business enough for two; and if a rival sits down beside him, both are ruined; whereas the success of the grocery should rather have hinted that a butchery or a bakery might have a good chance in the same place, or a grocery in some other suburb of similar character. Speculators in omnibuses and other horse-hired vehicles are signally liable to this sort of rivalry, often seeming unable to endure the sight of a brother of the trade driving a good, quiet, tolerably paying business.

C. for public offices—that is to say, the appointment to them of those young men who have shown the highest proofs of ability according to tests—has so recently been adopted, that there is little opportunity of judging of its effects. But it must be kept in view, that this is something quite different from the kind of C. referred to above. Clever men may be secured to the public service by such a test, but it is clear that the motive for these clever men, as well as other public servants, doing their duty, must be something in the shape of promotion or otherwise, which will have a constant influence on them after they are appointed. See EXAMINATIONS FOR THE PUBLIC SERVICE.

COMPIÈGNE, a town in France, in the department of the Oise, stands on the river Oise, a little below its junction with the Aisne, and 33 miles east-south-east of Beauvais. A fine stone-bridge crosses the river at this point. The town, which is irregularly built, has a tribunal of the first instance and one of commerce. The inhabitants, numbering (1876) 12,923, are employed in hosiery, rope-making, boat-building, and in traffic in wood and corn. But what best deserves observation at C. is the magnificent palace, built anew by Louis XV., and splendidly fitted up by Napoleon, who often occupied it. It contains a library, a picture-gallery, and other objects worth seeing. The park is extensive, and adjoining the gardens is the beautiful forest of Compiègne, extending over about 30,000 acres. C. is mentioned in the times of Clovis under the name of *Compendium;* and it was the seat of several political assemblies and ecclesiastical councils. It was at the siege of this town, in 1430, that the Maid of Orleans was captured; and here in 1810, Napoleon and Maria Louisa of Austria first met, on the occasion of their marriage.

CO'MPLEMENT is that which completes or makes up a given magnitude to some fixed magnitude. It is most commonly used in mathematics, to signify the arc or angle by which a given arc or angle falls short of a quadrant or right angle: thus, the C. of an arc of 60° is one of 30°; and that of 30° is one of 60°. —The arithmetical C. of a number is the number by which it falls short of the next higher number expressible by tens: thus, the arithmetical C. of 64 is 100 — 64 = 36.

COMPLEMENT, in Music, the quantity required to be added to any interval to complete the octave: for example, a fourth is C. of a fifth, a third is that of a sixth, &c.

CO'MPLINE. See CANONICAL HOURS.

COMPO'NÉ, or GOBONY, in Heraldry. When a bordeur, pale, bend, or other ordinary, is made up of two rows of small squares, consisting of alternate metals and colors, it is called componé.

COMPO'SITÆ (called by Lindley ASTERACEÆ, and by some botanists SYNANTHERÆ), a natural order of exogenous plants, distinguished by *compound* or *composite flowers*, i. e., heads of flowers which are composed of a greater or smaller number of florets (generally of small size) congregated upon a common receptacle, and surrounded by bracts which form a leafy or scaly involucre, so as to resemble single flowers, which name they ordinarily receive. Another very marked characteristic is, that the anthers of each floret cohere into a cylindrical tube. The order contains both herbaceous plants and shrubs; those which are natives of cold climates being generally herbaceous, and those found in warm regions shrubby, or even arborescent. They have alternate or opposite leaves, without stipules. The florets are either unisexual or hermaphrodite—those of the circumference (or ray) often differing in this respect, as well as in form and color, from those of the center (or disc) of the same head. Bracts (*paleæ*) are often interspersed with the florets upon the receptacle. The calyx is superior, closely adhering to the ovary, and essentially united with it, and afterwards with the fruit, its limb either obsolete or membranous, crowning the ripened fruit, often divided into bristles, hairs, and feathers, which form a PAPPUS (q. v.). The corolla is of one petal, superior, either strap-shaped or tubular, both forms often appearing in different parts (ray and disc) of the same flower (or head) sometimes 2-lipped, very often 5-toothed. The stamens are equal in number to the teeth of the corolla, 4 or 5, and alternate with them. The ovary is 1-celled, with a single erect ovule; the style simple, with 2 stigmas; the fruit dry and not opening (see ACHENIUM); the seed destitute of albumen.—This is the largest of the natural orders of flowering-plants, containing upwards of 1000 genera, and almost 10,000 known species. They are distributed over all parts of the world; but increase in number from the poles to the tropics, and thence, again, diminish towards the equator. In the Linnæan sexual system, they form a distinct class, SYNGENESIA. Jussieu subdivided the order into three sections, and although other subdivisions have been proposed, these are generally recognized as sub-orders—CYNAROCEPHALÆ, having the florets all tubular; CORYMBIFERÆ, having a disc of tubular florets, surrounded by a ray of strap-shaped florets; and CICHORACEÆ, having all the florets strap-shaped. The *Cichoraceæ* abound most in cold, and the *Corymbiferæ* in warm climates. The Artichoke and Thistle are familiar examples of the *Cynarocephalæ;* the Daisy, Aster, Dahlia, Chrysanthemum, Chamomile, and Sunflower of the *Corymbiferæ;* and the Dandelion, Chicory, and Lettuce of the *Cichoraceæ*.

By cultivation, many of the *Corymbiferæ* are changed so that the florets of the disc assume the same appearance with the florets of the ray, as may be seen in the Dahlia, Chrysanthemum, Aster, &c., and they are then said to be double, although the change they have undergone is very different from that which has taken place in double flowers of other kinds. The C. are not, in general, of very great importance in domestic economy or in the arts, although many of them are among cultivated and useful plants. Only a few, as the Artichoke, Scorzonera, Salsafy, Jerusalem Artichoke, Endive, and Lettuce, are used for food, and these are of inferior importance in that respect. A very few, as Safflower and Saw-wort, afford dye-stuffs; and a very few, as the Jerusalem Artichoke and Chicory, are occasionally cultivated for food of domestic animals; the use of chicory-root as a substitute for coffee is well known. From the seeds of some, a bland fixed oil is expressed—the Sunflower, Madia, and Ram-til being the most important. Many are valuable for their medicinal properties, as Chamomile, Arnica, Wormwood and some other species of Artemisia, Elecampane, Tussilago, Blessed Thistle, &c. Many are characterized by bitterness; stimulating properties are of frequent occurrence; also anodyne, diaphoretic, diuretic, and narcotic properties. Some, as Arnica, are very poisonous. A large number are esteemed ornaments of our flower-gardens, particularly in the latter part of summer and in autumn. Amongst these, the Dahlia perhaps holds the first place; and others, scarcely less admired, belong to the genera Aster and Chrysanthemum. The wood of the Siriehout (*Tarchonanthus camphoratus*), a small tree of the Cape of Good Hope, is close-grained, heavy, and very beautiful.

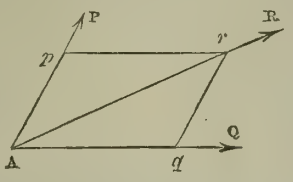
CO'MPOSITE O'RDER, in Architecture. See COLUMN.

COMPOSI'TION, in Art, signifies such an arrangement of the separate objects represented as that they shall all manifestly tend to bring out the center thought or idea which animates the whole. Episodes and digressions are less admissible in æsthetic works of art than in poetry, and less in plastic art than in painting. In all works of art, it is to be borne in mind that the story is to be told to, and apprehended by the eye alone. There is no surer proof of failure in æsthetic C. than when a picture is found to be totally unintelligible, even to intelligent persons, without the aid of a description in a catalogue. Rules are of little or no avail in this matter. There is but one canon of universal application—viz., that the artist should, in the first place, make it clear to his own mind what his work is to express; and that he should then consider by what arrangement of the objects that must, or may, be introduced into the picture, this will be best accomplished.

COMPOSITION, in Bankruptcy, a certain sum per pound which creditors agree to receive from a bankrupt in lieu of full payment of his debts, and the acceptance of which operates as a discharge to the bankrupt, and reinvests him in his estate. In Scotland, the acceptance of a C. bill, unless the contrary be stipulated, only entitles the creditors to rank for the C., and not for the full amount, in the event of a second bankruptcy. If no C. bill be accepted, and there be no accession to a C. contract, it has been held that the creditor may, in a second bankruptcy, rank for his full debt. In a Scotch sequestration, the bankrupt must find security for payment of the C. to the satisfaction of a certain proportion in number and value of the creditors, which proportion varies according to circumstances. The cautioner is only bound for two years, but recourse against the bankrupt is unlimited. The English Bankruptcy Acts give facilities to debtors to compound with their creditor, and to compel minorities to

agree to the C.; but all must be called together, and the proceeding goes through stages analogous to a regular bankruptcy.

COMPOSITION AND RESOLUTION OF FORCES AND MOTIONS. 1. The fundamental problem in statics is to find the magnitude and direction of the *resultant* of two forces; in other words, to compound them into a single force, which shall be in every respect their equivalent. Intensity and direction being the only elements necessary to entirely describe a force, forces in statics are represented by lines, which are obviously capable of being made to represent them both in magnitude and direction. When two forces act along the same straight line on a particle, it is sufficiently obvious that if they act in the same direction, the resultant will be their *algebraical* sum; if in opposite directions, their *algebraical* difference. This being premised, the relation between two forces acting at the same point, but not in the same line, and their resultant is set forth in the following theorem, which is known as the *Parallelogram of Forces:* If two forces, P, Q, acting on a particle A, be represented in direction and magnitude by the lines Ap, Aq, then the resultant will be represented in direction and magnitude by the diagonal Ar of the parallelogram described upon Ap, Aq. The proof of this depends upon the simple principles, that a force may be supposed to act at any point of its direction, that point being conceived to be rigidly attached to the particle on which the force acts; and what may be accepted as an axiom of universal experience, that when any number of forces are impressed on a particle or body, each exerts itself, as if the others were not acting, to produce its full effect.



See any elementary treatise on Mechanics. The doctrine of the parallelogram of forces has given rise to much controversy, not as to its truth, but as to its derivation, some appearing to contend that it is directly deducible from the axiom above stated, without the necessity of further reasoning.—Knowing how to compound two forces acting at a point, we are able to compound or determine the resultant of any number. If the forces, though in the same plane, do not act at the same point of a body, those of them whose directions meet may be compounded by the preceding rule; if they are parallel, their resultant is a force parallel to them and equal to their algebraical sum, counting those acting in one direction as positive, and in the opposite direction as negative. For the position of the resultant in this case, see PARALLEL FORCES. The singular case is that of equal parallel forces acting in opposite directions. These constitute a couple, and cannot be represented by any single force. See COUPLES.

2. The resolution of forces is the converse problem. To resolve a given force R, whose direction and magnitude is Ar, into two forces acting in any directions that may be chosen, as AP, AQ, we have only to draw parallels through r, which determine the lines Ap, Aq, representing the magnitude of the forces required. It is evident that there is an indefinite number of pairs of forces into which Ar might be resolved, according to the direction in which the new forces are to act. It is usual, however, to resolve a force into forces that are at right angles to each other.

3. The composition of motions is analogous in every way to that of forces; motions are the results of forces, and the analogy might be expected. If a body be actuated simultaneously by two velocities having different directions, it will evidently move in a direction intermediate to the two, and with a velocity which will in some way depend on each of them, and which is called their resultant. The proposition which sets forth how to find the resultant, is called the *Parallelogram of Velocities*. It is: If two velocities, with which a particle is simultaneously impressed, be represented in direction and magnitude by two straight lines drawn from the particle, the resultant velocity of the particle will be represented in direction and magnitude by the diagonal of the parallelogram described on those two straight lines. The proof is very simple. There is no reason why the full effect of both velocities should not be produced, as if the body moved first with one of them, and then with the other in their respective directions. If in one *second* the body moving with the one velocity would reach p, and if we suppose it then to move on pr for another second, parallel with the other velocity, it would at the end of the second second be at r. Hence, under their joint influence, it will be at r at the end of one second.

4. The resolution of motions is altogether analogous to that of forces.

COMPO'SITOR. See TYPE.

COMPOS MENTIS. See INSANITY.

COMPOSTE'LLA, MILITARY ORDER OF ST. JAMES OF. St. James, the elder, was adopted as the patron saint of Spain, after the victory of Clavijo, and his relics were preserved at Compostella (see SANTIAGO DE COMPOSTELLA). The marvels supposed to be performed by these relics drew vast numbers of pilgrims, for whose support hospitals were established by the pious canons of St. Eloy. The vicinity of the Moors having subsequently rendered the high-roads unsafe, thirteen noblemen united for the protection of the pilgrims, and, in conjunction with the canons, resolved to found an order of the same kind as that of the Hospitallers or Templars. The pope granted his assent in a bull, dated 5th July, 1175, accompanied with the statutes of the order. Whatever conquests were made from the infidel were declared the property of the order, and a council of thirteen knights was vested with authority to elect and depose a grand master. The knights made vows of poverty, obedience, and celibacy, and professed their belief in the immaculate conception. To protect Christians, and convert infidels, they vowed to be the only object in their wars with the Saracens. In most of the great battles between Christian and Moor, the red cross of the order was conspicuous. The conquests of the order itself, combined with the grateful munificence of the nation, speedily increased its wealth and power beyond those of any of the other orders of knighthood. In addition to the three large commanderies of Leon, Castile, and Montalvan, it possessed nearly 200 minor commanderies, comprising, it is said, more than 200 priories with many fiefs, cloisters, hospitals, castles, boroughs, two towns, and 178 villages, exclusive of its possessions in Portugal. This enormous wealth and power of the order excited the jealousy of the crown, in which, in 1522, the grand mastership was permanently vested by the pope. Having thus become merely honorary and dependent on the crown, the order rapidly decreased in importance.

Cross of the Order Compostella.

CO'MPOSTS are a kind of Manure (q. v.), consisting of mixtures of substances adapted to the fertilization of the soil, which being allowed to ferment, and undergo chemical changes for a considerable time in heaps, become more valuable than they were at first, or ever could have been if applied separately. C. were formerly made of farm-yard manure, and earth or lime in addition.

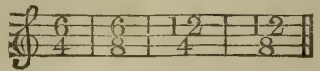
Road-scrapings, peat-moss, leaves, and clearings of ditches, also formed materials for the purpose. By allowing these to lie in heaps for six months, of from three to four feet in depth, food was prepared for plants. The mass was usually applied to the turnip-crop, and when artificial manures were unknown, considerable benefit arose from such dressings. The use of guano and other light manures has superseded in a great measure the necessity of this laborious process, and C. for the turnips or barley-crops are now little used. The wonderful effects that have resulted from the application of small doses of nitrogen and phosphoric acid, have impressed farmers in general with the truth, that the most energetic elements bear a small proportion in weight to the whole mass of farm-yard dung or C., and that the mixing of manures in heaps with earth does not so much add to its virtues as to repay the labor expended in the process. More care is now rightly bestowed in preserving manures from washings by rain. C. formed of leaves, ditch-scourings, road-scrapings, or any earthly matter containing a large percentage of vegetable matter, with the addition of lime, may still be used with benefit for pastures that are deteriorating, or where the soil is stiff. Where moss prevails, lime should enter largely as a component. On the other hand, where the soil is of a strong and clayey nature, earthly substances containing vegetable matter in larger proportions should be used. Vegetable matter has the effect of imparting a softness to the surface, that is particularly conducive to the free growth of pastures. Compost made of turf, leaves, earth, and bone-dust is used with great benefit by gardeners for vines and fruit-trees which are injured by too concentrated manures.

CO'MPOUND A'NIMALS, are those animals, exclusively of the lowest classes, in which individuals distinct as to many of the powers of life, are yet united in some part of their frame, so as to form one living system. Examples of this union are found in many animalcules and zoophytes, also in cestoid worms and ascidian mollusks. The whole living system in all C. A. appears to originate from a single egg or germ, and each is at first simple; the subsequent multiplication of individuals, having distinct organs, but permanently retaining their connection with the system, has some analogies with some of the modes of true reproduction. It is important, also, to observe that many C. A. exhibit very close relations to other animals which in no degree possess this remarkable character.

The subject of C. A. is in many respects an extremely interesting one. This occasional peculiarity in animal life may perhaps be regarded as affording some countenance to the theory of Darwin concerning plants, that each bud is to be accounted a distinct individual. But the term individual must be modified in

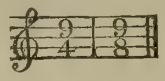
its sense, when applied to the buds of a tree, or the polypes of a polypidom.

COMPOUND COMMON TIME, that species of measure containing the value of two dotted minims in a bar, or two dotted crotchets, marked thus:



COMPOUND INTEREST. See INTEREST.

COMPOUND TRIPLE TIME denotes a measure of nine crotchets or quavers in a bar, and is marked thus:



COMPOU'NDING OF FE'LONY, in England, is the offence of taking value for forbearing to prosecute a felony, and is punishable with fine and imprisonment. Compounding of informations upon penal statutes, and compounding of misdemeanors, are also illegal, unless with leave of one of the courts at Westminster, and are punishable in a lighter degree. But in misdemeanors affecting many private (and not public) rights, the court will often permit the defendant to make the prosecutor some pecuniary amends, and thereupon withdraw the prosecution. A species of C. of F. is the advertising a reward for stolen property, coupled with words implying that no questions will be asked, or that no prosecution will be instituted, or that a pawnbroker returning the property will be paid what he has advanced for it; and this offence, by 24 and 25 Vict. c. 96, s. 102, is punishable by a fine of £50, on the advertiser, publisher, and printer. And whosoever shall take money or reward for restoring a stolen dog is liable, by 24 and 25 Vict. c. 96, s. 20, to imprisonment for eighteen months.

COMPRE'SSED-AIR BATH, a large chamber in which patients sit under increased atmospheric pressure for a greater or shorter period. An attempt at this kind of treatment was made as early as 1662 by Dr. Henshaw, but failed, owing to the imperfection of the apparatus. The apparatus, as now used, is the invention of M. Emile Laburié of Paris, who in 1832 conducted a series of careful experiments upon the effects of the atmospheric air at different densities upon the human frame.

The bath is a chamber 9 feet in diameter, and 12 feet high; it is constructed of iron plates rivetted together like those of a boiler of a steam-engine, so as to be perfectly air-tight; it is provided with two close-fitting iron doors, which can be opened without affecting the pressure of the air within the chamber; the interior is lined with wood, and furnished with seats; a steam-engine of seven horse-power works a pair of large air-pumps, communicating indirectly with the chamber by a pipe that opens by means of numerous small holes in the bottom of the floor, so that the air enters imperceptibly into the chamber; from the roof, a pipe similarly arranged allows the breathed air to escape. Each of these tubes is supplied with a screw valve, by means of which the inlet and exit of the air are regulated. Two barometers hang on the walls of the chamber, to show the rate of increase and decrease of pressure. The pressure is raised at the rate of 1 lb. every 4 minutes, and the lowering takes place at the same rate. The pressure is usually raised to 7 lbs. per sq. inch, in addition to the usual pressure of the atmosphere. The period generally prescribed for remaining in the bath is 2 hours.

The diseases in which the C. B. is said to be most efficient are phthisis, asthma, and chronic bronchitis. The effects are attributed to two causes: 1. A greater quantity of air, and consequently of oxygen, is inhaled in a given time; and not only so, but the amount absorbed is increased in proportion to the pressure of the gas against the walls of the air-vesicles. The increased absorption of oxygen and excretion of carbonic acid enables the lungs to perform their functions more efficiently, and thereby removes any congestion existing in these organs. 2. The increased mechanical pressure of the air upon the mucous membranes, when in a state of chronic congestion, has a bracing effect, and imparts renewed vigor to the entire structure of the lungs and bronchi. At Ben-Rhydding, the C. B. is used in cases of the kind above named, along with the usual appliances of the water-cure.

COMPRESSED-AIR ENGINE. One mode of employing air as a motive-power is described in CALORIC ENGINE (q. v.). Another obvious way is to compress it, and then apply it in the manner of high-pressure steam. Although compressed air has been used for working small engines in confined situations, such as Tunnels (q. v.), it is not at all likely that it will ever come into extensive use, owing to the great waste of power attending it. This waste arises from two causes—first, the friction due to forcing the compressed air along a great length of pipe; and secondly, the loss from the dissipation of the great heat which results from its compression. If, say, 100 cubic feet of air is compressed into 1 cubic foot, it will become very hot, and although it is very easy to keep in the air, it is impossible to keep in the heat.

In spite of every precaution, the heat will find its way through the vessel in which the air is confined, and through the pipes in which it is being trasmitted, and this is equivalent to a portion of the air itself leaking out, because, when the air is permitted to expand in working the engine, it will not attain the bulk it originally had of 100 cubic feet. The greater the original compression of the air, the higher its temperature will rise; and as this caloric, which cannot be kept from escaping, is practically a part of the bulk of the air, it follows that the loss of power from this cause will increase with the pressure of tension of the air. Even were it possible to prevent the escape of the heat, by covering the vessels and pipes with some non-conducting substance, it would not be practicable to use the hot air in the same way as steam is used, because the lubricating material necessary to keep the piston and slide-valves from 'tearing' would be decomposed by the high temperature. In steam-engines, there is always a small quantity of water in the cylinders and slide-valves, arising from the condensation of a portion of the steam, and this suffices to lubricate the piston and valves. It is well known that when steam is *superheated* so highly as to prevent a slight condensation in the cylinder and slide-valves, they are very rapidly destroyed. Air rises in temperature when very much compressed, and we cannot use it until its temperature falls; and as this involves a great waste of power, it follows that where economy is of any consequence, air cannot be used as a mode of transmitting mechanical power. Indeed, no fluid can be economically used for transmitting power for any great distance. We have just seen that compressed air is very unsuitable; steam is even more wasteful because it condenses into water in long pipes. Water itself loses much of its force from friction in passing through long pipes, unless they are of very large size; and in applying it to Hydraulic Cranes (q. v.), where the weight to be raised varies, great waste of power arises from the fact, that the cylinder, in which the ram works, has to be filled every time the crane is worked with water at the full pressure of 600 or 700 lbs. to the square inch, even when a pressure one-tenth of that amount would suffice to raise the weight. In short, the power actually used in working a hydraulic crane is always the maximum, even when the weight to be raised is a minimum. It *uses* as much power to lift a hundred-weight as it does to lift a ton. The extreme handiness and other practical advantages possessed by the hydraulic cranes leave a large balance in their favor, notwithstanding their waste of power.

In boring the Mont Cenis Tunnel (see TUNNEL), air was compressed at the mouth of the tunnel by the abundant water-power easily obtainable there, and forced along to the working face through small iron pipes, for working the boring-machines. The tunnel through the Hoosac Mountain in Massachusetts has also been bored by compressed air working the rock-drills. A plan has been proposed for using ordinary steam-boilers and engines close to the working face in the tunnel, and drawing out the smoke and vitiated air through a wooden trunk. Another fairly successful application of compressed-air engines has been in the working of coal-cutting machines. Of these machines, Firth's in England, Gladhill's in Scotland, and Brown's in America, have been in practical operation for several years; but they can as yet only be economically worked under exceptionally favorable circumstances. Experiments have been recently tried to propel tramway cars with compressed air. Engines for the compression of air are used in making ice. See REFRIGERATING MACHINES.

COMPRESSIBI'LITY is that property of bodies by which they admit of being forced or pressed into less space than they formerly occupied. The particles composing bodies are in all cases at greater or less distances from one another; and whatever brings the particles closer together, diminishes the volume or bulk of the body. This may be effected by various agencies, as e. g., by the withdrawal of heat (q. v.); but the effect is called compression only when it is caused by mechanical force, as by pressure or percussion. All bodies are compressible, but in different degrees. Many solids, especially those of a compact structure, have this property only in a slight degree. It was believed at one time that liquids were incompressible; more accurate experiments, however, have proved that this is not the case; water, for instance, subjected to a pressure of 15,000 lbs. on the square inch, loses $\frac{1}{20}$ of its volume. Gases, on the other hand, are strikingly compressible; by means of a common condensing syringe, a number of cubic inches of air can be forced into the space of one inch. Compression is in almost every instance accompanied by an evolution of heat. When a piston, having a piece of German-tinder attached to the bottom, is forced rapidly to the bottom of a shut condensing syringe, and rapidly withdrawn, the tinder is found ignited.

In a restricted sense, those gases are said to be compressible which, under great pressure, become liquid. This is the case with carbonic acid gas, chlorine, sulphurous acid gas, and others. Atmospheric air and its components have hitherto resisted all at-

tempts to liquefy them; though it is believed that only a sufficient degree of pressure and cold is necessary to make any gas liquid. Carbonic acid and some other gases are liquefied in small quantities by enclosing the ingredients necessary for generating the gas in a strong glass tube, keeping them separate till the tube is hermetically sealed. The gas, as it is produced, is condensed into a fluid by its own pressure, which is aided by keeping one end of the bent tube in a cooling mixture.

COMPU'LSION. Acts done or grants made under the influence of C.—i. e., either force or fear—are reducible by the law of Scotland. But the fear must be such as would shake a man of ordinary firmness and resolution. In like manner, the plea of *vis major*—that is, that the individual acted under the influence of power greater than his own—may relevantly be set up as a defence against such offences as rebellion, piracy, &c. See DURESS.

COMPURGA'TORS were twelve persons whom the law of our Saxon ancestors permitted the accused to call in proof of his innocency, and who joined their oath to his. They were persons taken from the neighborhood, or otherwise known to the accused. It was rather in the character of jurymen than of witnesses that the C. acted, for what they swore to was not their knowledge, but their belief, and the institution belonged to a time when what has since been spoken of as the Saxon jury was taken from the persons in the neighborhood best acquainted with the matter to be investigated, and when they performed the combined functions of jurors, witnesses, and judges. The system of C. was adopted even in civil actions for debt, and the ceremony of what was called canonical purgation of clerks-convict, was not abolished in England till 18 Eliz. c. 7.

COMPUTA'TION OF TIME. See DAY.

CO'MRIE, a village and parish in the middle of Perthshire, on the Earn, a little east of Loch Earn, and 20 miles west of Perth. It lies amid the very picturesque scenery of the clay-slate band of Scotland, and is noted for frequent slight shocks of earthquakes. It has woollen and cotton weaving, and distilleries. Pop. (1881) 2038.

COMTE, AUGUSTE, the founder of the 'Positive Philosophy,' was born at Montpelier in 1795 or 1797. He studied at Paris; and at an early period, it is said, attracted the attention of his companions by the boldness and novelty of his speculations, maintaining that the time was come when philosophy must undergo another great change, such as it had done in the days of Bacon. G. H. Lewes, who regarded C. as the Bacon of the 19th c., only much greater, informs us that C. was but *fourteen* when 'the reforming spirit awoke' in him (see *Exposition of the Principles of the Positive Philosophy*, by G. H. Lewes, Bohn, London, 1853). Shortly after this, and while still laboring under the excitement of his new convictions, he became acquainted with St. Simon; entered enthusiastically into his theories, which had not a little in common with his own, and which possessed in addition this advantage, that they were the results of natural thinking (St. Simon being between fifty and sixty); and in 1820, was appointed by the master himself to prepare an exposition of the *Politique Positive* of the St. Simonian Society. The work did not satisfy St. Simon, who deplored the absence of the 'religious and sentimental aspects' of his system. In 1825, on the death of St. Simon, C. broke off altogether from his *confrères*, and in after years, was accustomed to speak slightingly of his old master's abilities. In 1826, C. was attacked by a cerebral disorder, brought on by 'overwork and heart-anxieties.' He recovered, however, and in 1832, was appointed professor of mathematics at the *Ecole Polytechnique*, which situation he was forced to resign in 1852, on account of differences with his colleagues. He died at Paris, September 1857.

C.'s works are—*Cours de Philosophie Positive* (6 vols., Par. 1830—1842; freely translated into English, and condensed by Harriet Martineau, 2 vols., 1853), *Traité Elémentaire de Géométrie Analytique* (1843), *Traité d'Astronomie Populaire* (1845), *Discours sur l'Ensemble du Positivisime* (1848), *Système de Politique Positive* (4 vols., 1851—1854; Eng. trans. 1875 *et seq.*, Longmans), and *Catéchisme Positiviste, ou Sommaire Exposition de la Religion Universelle* (1 vol., Par. 1852). It is impossible here to do more than state, in the briefest way, C.'s central and governing doctrine. It is this: The race (like the individual) necessarily passes through three intellectual stages—1. The *theological*, in which a supernatural origin is sought for all phenomena, and the *Deus ex machinâ* is the only explanation of events; 2. The *metaphysical*, in which the *sensuously* supernatural is set aside as incredible, and an effort is made to demonstrate the existence of 'abstract forces or entities supposed to inhere in various substances, and capable of engendering phenomena;' 3. The *positive*, in which the mind affirms the futility both of theological and metaphysical inquiries, abandons all vain search after the *causes* and *essences* of things, 'restricts itself to the observation and classification of phenomena, and to the discovery of the invariable relations of succession and similitude which things bear to each other; in a word, to the discovery of the *laws* of phenomena.'

This last is the stage at which C. conceives Europe to have arrived. Theology and metaphysics are alleged to be in their dotage, and all the anarchy of modern life to arise from the presence of these disturbing elements. To deliver us from their hurtful influence, C. employs the principles of positivism to organize a new social doctrine which shall embrace the entire wants of man as an intellectual and emotional being. C. thus aims at being not only the founder of a new philosophy, but also of a new religion, and has even assumed the title of *Fondateur de la Religion de l'Humanité*. His views, which are very original and comprehensive, have excited much attention among thinkers in France, England, and Germany, and obtained not a few ardent adherents.

CON, or COL, an Italian particle, meaning 'with,' much used in musical terms, as 'con spirito,' 'con brio.'

CONCAN, a territory in the presidency of Bombay, lies between the Arabian Sea and the watershed of the Western Ghauts, in lat. 15° 44′—20° 22′ N., and long. 72° 52′—73° 45′ E. Its length is 330 miles, and it varies in breadth from 25 to 50 miles. The more easterly section appears to be a succession of rocky terraces, of apparently volcanic origin. The maritime portion, averaging an elevation of 100 feet above the sea, rises here and there to far greater heights, partly in isolated hills, and partly in short ranges. The broad estuaries into which the rivers expand were formerly the retreats of pirates. Of the land that is available for cultivation, the larger part is found on the banks of the rivers—the growth of rice in particular being promoted by annual inundations. The chief peculiarity of the climate is, that the south-west monsoon, arrested in its career by the lofty barrier on the east, has been known to yield, in one year, a rainfall of nearly 300 inches. To omit the city of Bombay, as not being on the mainland, the principal towns are Junera, Ratnagheriah, Viziadroog, and Vingorla. It was in 1818, on the fall of the Peishwa of the Mahrattas, that C. became British territory.

CO'NCAVE. A surface is said to be C. when lines drawn from point to point in it fall between the surface and the spectator; and convex, when the surface comes between him and such lines. The terms, it is obvious, are mere terms of relation. See LENS and MIRROR.

CONCEA'LMENT, in Criminal Law. The C. of an offender, after the commission of the crime, with the view of shielding him from justice, is an offence which may be punished arbitrarily; but C., in consequence of an agreement before the crime was committed, envolves the concealer in a charge of art and part in the principal crime (Hume, 274,281).

CONCEALMENT OF PREGNANCY AND BIRTH. See PREGNANCY, CONCEALMENT OF; INFANTICIDE.

CONCENTAI'NA, a town of Valencia, Spain, picturesquely situated on a slope of the Sierra Mariola, 28 miles north of Alicante. It is surrounded by old walls, flanked with towers; has some interesting old buildings; and manufactures of linen, woollen, paper, soap, &c. The fair annually held here is one of the largest in Spain. Pop. 8100.

CONCE'NTRIC. Circles are C. when they have the same center, but radii of different lengths.

CONCEPCION. 1. A city near the mouth of the Biobio, the principal river of the republic of Chili, in lat. 36° 50′ S., and long. 73° 5′ W. In 1835 the place was almost destroyed by an earthquake, the cathedral and most of the other public buildings having been thrown down. The city is nevertheless one of the most regular and handsome in the republic, and numbers (1875) 18,277 inhabitants. The cathedral and several of the other public buildings are noteworthy. The industry of the place is chiefly in the hands of foreigners, especially Germans. The discovery in 1852 of coal-fields a little to the south of C. has done much to forward the prosperity of the city. Talcahuano, the port of C., is the safest and best harbor in all Chili, and ranks next to Valparaiso as a mart of foreign trade. Hides and tallow are exported. —2. The bay of the Pacific Ocean which forms the harbor of the city above mentioned. It affords good anchorage, communicating with the interior by means of the Biobio, and being sheltered from the open sea by the island of Quiriquino.—3. The province of which the city above mentioned is the capital. Occupying the entire breadth between the Andes and the coast, it is bounded on the S. by independent Araucania, and contains 3850 square miles. In 1875, the population amounted to 151,365.

CONCE'PTION, in Psychology. See IDEA.

CONCEPTION, IMMACULATE. See IMMACULATE CONCEPTION.

CONCEPTION OF OUR LADY, an order of nuns, founded in 1484, in honor of the immaculate conception, by Betrix de Sylva, sister of James, first Count of Poralegro, in Portugal. It

was confirmed in 1489 by Pope Innocent VIII., who granted the sisterhood permission to follow the rule of the Cisterciana; but after the death of the foundress in 1489, Cardinal Ximenes put the nuns under the direction of the Franciscans, and imposed on them by the rule of St. Clara. The order subsequently spread into Italy and France. Besides the grand office of the Franciscans, the nuns recite on Sundays and holidays a lesser office, called the office of the Conception of the Holy Virgin. Their dress consists of a white gown, a blue mantle, and a scapulary, on which is worn the image of the Virgin.

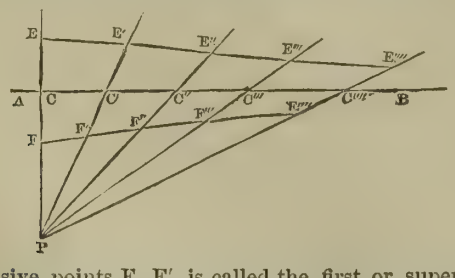
CO'NCERT, a musical entertainment of concerted pieces, symphonies, &c., sometimes interspersed with songs, performed by an orchestra of many instruments. C. performances are now established in almost every city in Europe, and societies are formed to foster and encourage the art. Among the oldest institutions of this kind are the Gewandhaus Concerts in Leipsic, established in 1742; and the Concerts Spirituels in Paris, established in 1725. Of more recent institution are the concerts of the Philharmonic Society in London, of the Conservatoire in Paris, and the Symphonic concerts in Berlin, &c.

CONCERTI'NA, a musical instrument of modern invention, the sounds of which are produced by free vibrating springs of metal, as in the accordion. The scale of the C. is very complete and extensive, beginning with the lowest note of the violin, G, and ascending chromatically for three-and-a-half octaves to C. Violin music can be performed on the C. with good effect. Every sound in the scale is double, and can be produced either by pulling the bellows open, or by pressing them together. Wheatstone of London is the inventor. Concertinas are now made in France and Germany, but not so perfectly as in England.

CONCE'RTO, a musical composition for a solo instrument, with orchestral accompaniments, calculated to give the performer an opportunity to display the highest mechanical skill, as well as intellectual cultivation in the art. The C. consists of three movements, each of which, like the whole, has a certain character, and like the symphony or the sonata, requires a clear development and treatment of the motives, and a strict adherence to the rules of form. When the form is in any way abridged, it is then called a concertino. From the beginning of the last century to the present time, the pianoforte and the violin are the solo instruments mostly used for the concerto. The oldest violin concertos are those by Tartini and his scholars. The French and Germans afterwards improved on these, and fixed the forms, which all the great masters of modern times have adhered to. Innumerable concertos have been written for the pianoforte, amongst which compositions of the most masterly kind are to be found. Concertos for wind-instruments have been less regarded, and are generally written by the performers themselves, and seldom deserve to be called classical works.

CONCHI'FERA (Lat. shell-bearing), in Lamarck's arrangement of mollusks, a class containing those which have bivalve shells *Lamellibranchiata* (q. v.) and *Brachiopoda* (q. v.). The term is still sometimes used.

CO'NCHOID OF NICOME'DES, a curve invented by Nicomedes, with the view of trisecting an angle, of constructing two geometrical means between two given straight lines, and of 'doubling the cube.' It is generated as follows: Let AB be any straight line, and P any point not upon it; then let a succession of lines PE, PE', &c., be drawn, cutting AB in points C, C', and let CE, CF be laid off from the points of intersection, each equal to a given line: then the curves traced by the successive points E and F form the conchoid. That branch which is above AB, and described



by successive points E, E', is called the first or superior C., and the other branch traced by points F, F', is called the second or inferior conchoid. Both branches are infinite in extent, and they have the line AB for a common asymptote. AB is also called the directrix, and P, the pole of the curve. The constant distance CE, of the points E and F, from the points of intersection, is sometimes called the modulus of the curve. If we take C in the line EP as origin, and the lines AB and EP, at right angles to one another, as axes, the equation to the C. is $x^2=\frac{(b+y)^2(a^2-y^2)}{y^2}$, where a is the modulus of the curve, and b = the perpendicular distance of P from AB. The curve may easily be described mechanically, and is frequently used in architecture as a bounding line of the vertical section of columns. The name is Greek, and means shell-shaped.

CONCHO'LOGY (Gr. *konchos*, a shell, *logos*, a discourse), the science which treats of shells and of the animals inhabiting them. C., as a science, is at least as old as the days of Aristotle; the study of it was resumed along with that of the other sciences, when the dark ages had passed away; but since the beginning of the present century, it has given place to a more extended and comprehensive study of molluscous animals, now sometimes designated MALACOLOGY; the presence or absence of a shell having been found not to constitute one of the most important characters which distinguish different classes of mollusks. C., indeed, was only the form of the science suited to a time when the shell was more considered than its inhabitant. Yet the relations between shells and the mollusks which possess them are such, that the labors of the merest conchologists have contributed to the real advancement of science, both zoological and geological. It is upon the knowledge of these relations that many of the conclusions of the geologists are founded.

In systems of C., shells were usually divided into three orders, *Univalves*, *Bivalves*, and *Multivalves*, according to the number of pieces—one, two, or more—of which they are composed. The first two were established by Aristotle, the third was added in modern times.

CO'NCLAVE (Lat.), either the place where the cardinals assemble for the choice of a pope, or the assembly itself. The practice of a C. originated at the election of Gregory X. at Viterbo in 1271, and was regulated by the Council of Lyon in 1274, with formalities still substantially in force. The C. must consist of a single apartment, having only one door, which is kept securely locked. Food and other necessaries are handed through a window, and are subjected to a rigorous examination, in order to prevent communication with the outer world; the cardinals not being allowed to leave the place, or to receive or to send out letters, until a new pope is chosen. As the C. was generally held in the Pauline Chapel at Rome, a number of little cells were erected in one of the galleries, each to form the lodgment of a cardinal.

A *Conclavist* is a spiritual or secular attendant on the cardinals during the C. Each cardinal is allowed three. They are sworn to silence, and are not allowed to leave, except in dangerous illness. Formerly a sum of 10,000 crowns was divided among the conclavists at each election.

CO'NCORD, the capital of New Hampshire, U.S.—called RUMFORD before the American Revolution, from which Count Rumford took his title—is on the right bank of the Merrimac River, 59 miles north-west of Boston, lat. 43° 12′ 29″ N., long. 71° 29′ W. C. is a handsome village, extending two miles along the river, with state-house, state-prison, state lunatic asylum, city hall, two railroad dépôts, nine churches, four or five newspapers, and manufactures of carriages, iron, steel, machinery, musical instruments, woollens, &c. Pop. (1870) 12,241; (1880) 13,836.

CO'NCORD, by English writers on music, is defined as the relation, harmony, or agreement between two or more consonent sounds; such as the union of the major or minor third with the perfect fifth and octave. The German musical technology gives a wider meaning to this term, defining C. as every simultaneous sounding of tones, whether in single intervals or in complete chords, and whether consonant or dissonant.

CONCO'RDANCE, a book arranged in alphabetical order, and showing in how many passages all, or at least all the more important words in any work occur. For writings of universal import, from which passages are continually being adduced to prove or support principles affecting our daily life and action, such a handbook is indispensable. The necessity of a C. for the Bible seems to have been felt at an early period. The first was executed by Antonius of Padua (b. 1195, d. 1231), who published it under the title *Concordantiæ Morales*. He was followed by Hugo de St. Caro (1244) and others, all of whom based their labors on the Latin Vulgate. A Greek C. by Euthalios of Rhodes was prepared about the year 1300, but has been lost. The Alexandrine C. of the Old Testament was compiled by Conrad Kircher in the 16th c., and Xistus Vetuleius published in 1546 a C. of the Greek New Testament, which was republished and amended by Stephens in 1600.

In Hebrew, a C. was drawn up by Rabbi Isaac Nathan, in 1438, amended by Marius of Calassio (Rome, 1620), by John Buxtorf (1632), and by Fürst (Leip. 1837—1841). The chief concordances for Luther's translation of the Bible are those of Lankisch, Büchner, Wichmann, and Schott. For the authorized English version of the Bible, the best C. was compiled by Alexander Cruden, and first published in 1737. Among the best editions of this work we may mention those bearing the dates 1810 and 1824. The C. of Parallels, by Crutwell (1790), is esteemed a valuable work. Among

secular works of this kind, the *Complete Concordance to Shakspeare*, compiled by Mrs. Cowden Clarke (Lond. 1845), is one of the most remarkable.

CONCO'RDAT (Lat. *concordatum*, 'a thing agreed on'), although sometimes used of purely secular treaties, is now almost exclusively employed to designate a compact on ecclesiastical affairs between the pope, as head of the Roman Catholic Church, and the temporal ruler of a particular kingdom or state. Concordats commonly relate to things which are neither purely spiritual, as faith, the sacraments, or worship, nor purely temporal, as civil rights, taxation, &c., but mixed matters, regarding which each power makes certain claims, in regard of which the action of the two powers can with difficulty be dissociated; and in which, therefore, in the hope of harmonious co-operation for the public good, each is willing to cede to the other a portion of its peculiar right. Concordats are of two kinds—the first in the form of a treaty, to which both the contracting powers are formally consenting parties; the second, in which the terms are concerted by both, or, at least, are mutually accepted, but are published only by one, most commonly by the pope, in the form of a bull, reciting the enactments which result from the agreement. This difference is only in form. In both it is a settled doctrine of Roman Catholic canonists, and especially of those of the Ultramontane (q. v.) school, that the pope never absolutely cedes purely spiritual powers. Thus, in the presentation to bishoprics, while the king 'nominated' or 'elected,' the pope always reserved to himself the power of 'canonical institution.'

We shall briefly enumerate the most important concordats. (1.) *Concordats with Germany.*—The earliest subject of negotiation between church and state in Germany was the mode of electing the popes, to which subject may be referred the compact of Otho I. with John XII., and the constitution of Leo VIII.; but the well-known concordat of Worms in 1123, regarding investitures, is commonly regarded as the first concordat strictly so called.

Similar agreements took place on the question of the *Regalia* (q. v.), between the Roman see and the emperors Otho IV., Frederic II., and Rudolph of Hapsburg. A more comprehensive compact on church matters is that of which the foundation was laid at Constance in 1418, and which was subsequently modified, by the 'Frankfort' or 'Princes' Concordat,' by the concordat of Aschaffenburg, and by that of Vienna; which last, although practically disregarded by Joseph II. and Leopold, continued in use till the suppression of the Emperor of Germany in 1803. Its place was supplied, under Pius VII. and his immediate successors, by separate concordats with Bavaria, 1817; Prussia, 1821; Baden, Würtemberg, and other minor states, 1818; Hanover, 1824; Saxony, 1827; and the Netherlands in the same year. The last German concordat was that concluded at Vienna, August 18, 1855. The chief articles were that the pope should have direct communication with the bishops, clergy, and people, and archbishops and bishops with their clergy and their flocks, and the right to govern their sees according to the canonical law. Education was placed entirely under the control of the church. The bishops were to settle what books should be used. The chief inspector of schools was to be chosen by the emperor from among the individuals selected by the bishops. The government bound itself to prevent the dissemination of books pointed out as dangerous to religion by the bishops or archbishops. All questions of marriage, except in so far as they might involve civil consequences, were reserved exclusively to the ecclesiastical courts. Priests guilty of crimes were to be tried in the temporal courts; but the bishop was to be duly notified of the fact, and convicted priests were to be imprisoned apart in a monastery or other ecclesiastical building. The emperor was to choose bishops, but with the advice of the existing bishops and archbishops. The church might acquire new property, but once acquired, it could not be sold or mortgaged without the consent of both pope and emperor. The concordat was set aside in 1868 in all the dominions of the Emperor of Austria. (2.) *With France.*—The Pragmatic Sanction, ascribed to St. Louis, but really of later date, has some of the characteristics of a concordat; but the first proper concordat is that of Francis I. with Leo X. in 1515 and 1516, which continued in force, although with more than one conflict of the two powers, till the Revolution.

In re-establishing the church in France, Napoleon Bonaparte, as first consul, concluded with Pius VII., through the agency of Cardinal Consalvi, the celebrated concordat of 1801; which he afterwards compelled the pope, then a captive at Fontainebleau, to modify by a new act in 1814. Both were ignored at the Restoration; but an attempt to produce a substitute in 1817, and again in 1819, led to no practical change. (3.) *With Italy.*—In Italy, an agreement regulating the election of bishops was concluded with Nice and Savoy by Nicholas V. in 1451; and a formal concordat was made with Sardinia by Benedict XIV. in 1740. The ecclesiastical affairs of Naples were anciently regulated by the terms of what was called the *Monarchia Sicula;* but a formal concordat was concluded with Charles III. by the same pope in 1741, and a new concordat was made by Pius VII. in 1818. (4.) *With Spain.*—Charles V. concluded a concordat for his Spanish kingdom with Adrian VI. and Clement VII.; and a further concordat was made by Clement XII. and Philip V. in 1737. (5.) *With Portugal.*—Benedict XIV. made a concordat with Portugal in 1741.

CO'NCRETE (Lat. *concrescere*, to grow together) is opposed to abstract (see ABSTRACTION). A concrete notion is the notion of an object as it exists in nature, invested with all its qualities, as any particular flower, leaf, or tree; an abstract notion is the notion of any attribute of that flower, leaf, or tree, such as its color, form, or height; qualities which may be thought of independently of the objects in which they inhere, though they cannot so exist.—The abstract method of handling a subject is adapted to speculation and reasoning; the C., to poetic effect and impressive illustration.

CONCRETE, a mixture of hydraulic or other mortar with gravel or shingle, which, on hardening, forms an artificial conglomerate. The best C. is made by well mixing hydraulic mortar (see CEMENT) with sand and sufficient water for complete hydration, and then adding the shingle or screened ballast, and mixing them well together. An inferior C. may be made by laying the shingle into the foundation or other place where the C. is required, and then pouring mortar upon it, to fill the interstices between the pebbles.

The principal use of C. is to form a basis of artificial stone for buildings that rest upon loose or damp subsoils. Such a basis, if well made, forms a solid foundation-slab upon which the weight of the whole structure is equally distributed. It also resists the capillary ascent of moisture from the soil, which would otherwise take place through brickwork or porous stone. A very extensive and important application of C. in this manner has been made in the lower part of Pimlico and Thames Bank. An extensive district that, only a few years since, was a pestiferous marsh, is now covered with high-class houses, and forms one of the fashionable quarters of the West End of London. The houses, and, in fact, the streets altogether, may be said to rest upon a substratum of artificial rock formed of C., which, besides giving stability to the buildings, shuts out the exhalations from the soil, and prevents the ascent of the moisture so abundant below.

C. is occasionally used for building walls by ramming it into moulds, giving it the form desired. A very beautiful application of C. for making mosaic floors is common in Italy. A stratum of cement is laid, and the surface carefully levelled; then pebbles of variegated colors are sifted over it; before it is quite hardened, these are beaten down, so as to be imbedded in the cement, and form the top layer. When the C. has completely hardened, the rounded surfaces of the pebbles are ground down by means of a large slab of stone, which, together with sharp sand, is rubbed over the surface until it is quite smooth; and thus a variegated pavement is formed by the flattened surfaces of the colored pebbles and the cement between them.

CONCRE'TION, in Medicine, a formation of solid unorganized masses within the body, either by chemical precipitation from the fluids, or by the accidental aggregation of solids introduced into the system from without. In the former case, a C. is termed a Calculus (q. v.); in the latter, the C. may be either wholly composed of solids foreign to the body, or these may be mingled with the elements of the secretions, as with mucus, or calculous matter. Thus beans, peas, needles, &c., introduced into the cavities of the body, have become the nuclei of concretions, by attracting around them mucus, or crystalline deposits from the urine. The most remarkable forms of C., however, are perhaps those formed in the stomach and intestines of man and the lower animals, from the more solid and indigestible parts of the food, or of substances improperly swallowed. Thus, young women have been known to acquire the habit of swallowing their own hair to a great extent; and very large concretions have been thus formed, which have

Fig. 1.—Mass of hair and string from the stomach of a young girl.
Taken from the *Pathological Society's Report.*

Fig. 2.—Section of an alvine or intestinal concretion, formed in successive layers upon a piece of bone.
Taken from Munro's *Anatomy.*

proved fatal, by obstructing the passage of food. The annexed cut (fig. 1) shows such a C.; retaining exactly the form of the stomach within which it was found. The use of oatmeal in large amount has also been found to lead to concretions, especially when eaten coarsely ground and unboiled; such concretions have commonly been found in the intestines (See fig. 2).

The excessive domestic use of magnesia in the solid form as a laxative, has been known to have a similar effect. In certain animals, intestinal concretions are not uncommon, and grow to an immense size; they used to be greatly prized as antidotes, and were used in medicine under the name of Bezoars (q. v.). In certain forms of morbid deposits, such as fibrous tumors (see TUMOR), and in Tubercle (q. v.), concretions not unfrequently form; they are for the most part composed of phosphate of lime.

CONCRE'TIONARY STRU'CTURE is a condition in rocks produced by molecular aggregation subsequent to the deposition of the strata, whereby the material of the rock is formed into spherules or balls, as in the grains of oolitic limestone, or the larger concretions of magnesian limestone.

CONCU'BINAGE. The earliest Roman laws were distinguished for the strictness with which they treated marriage. They not only upheld thoroughly the principle of monogamy, but they fettered marriage itself with many burdensome forms. Hence arose the practice of a free unmarried man entering into a less strict relation with a single woman—a sort of permanent cohabitation. The offspring of such a connection, called natural children, had not the rights of legitimate children, but they were recognized by the father. Augustus, with a view to promote regular marriages, and check the growing licentiousness, enacted a comprehensive marriage-law (*Lex Julia et Papia Poppæa*), which still allowed C., but only with women of low rank or who had lost their station. Christianity required the complete sanctity of marriage, although the civil law long continued to tolerate separation at pleasure. In the Eastern empire, C. was entirely prohibited by the Emperor Leo. The ancient laws of the Germans recognized, along with regular marriage, an informal connection of the sexes. In the middle ages, a similar connection became customary, called a 'left-handed,' or Morganatic Marriage (q. v.). The Code Napoleon does not allow of C., but the wife can sue for separation only when the husband maintains a mistress in the common dwelling.

CONCU'RRENT JURISDI'CTION. Jurisdiction is said to be concurrent, or cumulative, when it may be exercised in the same cause by any one of two or more courts. To prevent the collision which might arise from each of the courts claiming to exercise the right, it has been established as a rule, that the judge who first exercises jurisdiction in the cause acquires a right, *jure præventionis*, to judge in it exclusive of the others. The judge by whose authority an offender is first cited or first apprehended, prevents, and so excludes the other from his right of cognizance. 'This right of prevention plainly appears to be peculiar to criminal jurisdiction. In civil, it is the private pursuer who has the only right of choosing before which of the courts he shall sue.' —Erskine's *Institutes*, b. i. tit. ii. s. 9. Opposed to *concurrent* or *cumulative*, is *privative* jurisdiction. In England, in some cases, there is C. J. between the superior and county courts.

'Where the plaintiff dwells more than 20 miles from the defendant; or where the cause of action did not arise wholly, or in some material point, within the jurisdiction of the court, within which the defendant dwells or carries on his business at the time of the action being commenced; or in general where any officer of the county court is a party; in any of these cases, the superior courts have a concurrent jurisdiction'—Stephen's *Com.*, v. iii. p. 383. By 19 and 20 Vict. c. 108, s. 39, it is provided, that if, in an action or contract, the plaintiff claims more than £20, or, in an action of *tort* (that is, for wrong independent of contract), more than £5, and the defendant gives notice that he objects to the action being tried in the county courts, and gives security for the amount sued for with costs—all proceedings shall be stayed in the county court.—*Ib.* note.

CONCU'SSION, in Medicine, a sudden impression or shock communicated to the brain or to the whole nervous system, as the result of a severe injury, or collision of the body with some external object, as in a fall, or in the crash of a railway accident. It is usual to distinguish C. from the more mechanical results of injury, by observing its effect upon the circulation and on the general sensibility; and there can be no doubt that the distinction is well founded, for in the first place death may follow from C. alone, without any appreciable destruction of texture; and 2dly, C. may be followed by recovery within a few hours, leaving the local injury entirely unattended by constitutional disturbance; or recovery may be complete, there having been no local injury at all. Under the immediate shock of injury, the patient is usually unconscious and insensible, pale, cold, sometimes shivering, pulseless, or nearly so, the pupils inclining to contraction rather than dilatation, or in some cases natural; the breathing is irregular, slow, feeble, and sighing; the secretions are suspended; the stomach often yields up its contents; and the bowels and bladder may also be evacuated. This state ends either in death, or in gradual re-action, which may pass over into a state of inflammatory fever, with violently excited circulation, and greatly increased heat of the surface. In the treatment of C., it is sometimes necessary to have recourse to stimulants; but in general, moderate heat applied to the surface, abundant supplies of fresh air, and careful adjustment of the injured parts, are all that is necessary till consciousness is somewhat restored, and the power of swallowing regained; some warm soup should then be given, with a small allowance of wine or other stimulant, proportioned to the age and habits of the individual; and the effect being carefully watched, this treatment may be continued until restoration is complete.

If there be danger of failure of the breathing or heart's action, artificial respiration (see RESPIRATION) should be employed without delay; and the patient should be transferred as soon as possible from the place of the accident to a warm and comfortable bed, where the necessary restoratives may be more conveniently used. The connection of the nervous system with the heart, in cases of C., is a very curious subject in physiology, and has been the subject of minute investigations by Bichat, Legallois, Wilson Philip, Marshall Hall, and many others.

CONCUSSION FUSE. See FUSE.

CONCUSSION SHELL. See SHELLS.

CONDÉ, the name of several places in France, the following being the most important:

CONDÉ, in the department of Nord, situated at the confluence of the Haine and Scheldt, about seven miles north-north-east of Valenciennes. It has an arsenal and strong fortifications, constructed by Vauban, and was the scene of severe contests in the Napoleonic wars. Here are coal-pits and a great coal depot; and the manufactures of starch, chicory, leather and soap. Pop. (1876) 3382.—CONDÉ-SUR-NOIREAU, a town in the department of Calvados, at the union of the Durance and the Noireau, 25 miles south-south-west of Caen. It is an old place, with dark heavy houses. Its manufactures are cottons, cutlery, and leather; and it has a pretty extensive trade in cattle, honey, &c. Pop. (1876) 6835.

CONDÉ, a family celebrated in French history, and which takes its name from the town of Condé (q. v.), in the department of Nord. One Godfrey de C., about the year 1200, was in possession of a part of the barony of Condé. His great-granddaughter, Jeanne of C., married in 1335 Jacques de Bourbon, Comte de la Marche, and the barony of C. went to their second son, Louis de Bourbon, Comte de Vendôme; whose great-grandson, Louis de Bourbon, Prince of C., in virtue of his blood-relationship to the royal family, assumed the title of Prince, and is regarded as the founder of the new house of this name.

CONDÉ, LOUIS DE BOURBON, PRINCE DE, was born 7th May 1530, and first distinguished himself under Marshal Brissac. In the dissensions between the Houses of Guise and Bourbon, C. was the soul of his party, which was for the most part Calvanistic or Huguenot. It was he who directed the conspiracy of Amboise, which had for its aim the banishment of the Guises, and the capture of Francis II. On its discovery, he fled to his brother at Nérac, and there projected a plan for securing possession of all the large towns of France, which, however, miscarried, and C. himself was taken prisoner, and condemned to be executed; from which fate he was luckily saved by the opportune death of the king.

On the accession of Charles IX. to the throne, C. obtained his liberty and the governorship of Picardy; but the harsh treatment which the Huguenots in general received, drove him into rebellion; and on the 11th of April, 1562, he commenced a civil war by the capture of Orleans, Rouen, and other places. Defeated and taken prisoner at the battle of Dreux, in the same year, he was employed by the victors in concluding a treaty of peace, which lasted only a short time. C. recommenced hostilities by a daring but unsuccessful attempt to possess himself of the person of his sovereign (28th September, 1567). After the battle of St. Denis, 10th November, 1567, a second peace was concluded; but having reason to believe that Catharine de' Medici was plotting against his liberty, he once more renewed the war against the Catholic party, in the beginning of 1569, but was again defeated and taken prisoner at the battle of Jarnac, 13th March of the same year. While his wounds were being dressed on the field, a captain of the Swiss guard, named Montesquieu, approached, and shot him through the head. C. was of a joyous and amorous disposition. His gallantries were far from being in accordance with the austere character of the religion he professed, and it cannot be doubted that the feeling of political rivalry to the House of Lorraine, which animated the Bourbon family, explains the career of C. quite as much as his religious convictions.

CONDÉ, LOUIS II. OF BOURBON, PRINCE OF, commonly termed 'the Great Condé,' was the great-grandson of the preceding, and was born September 8, 1621. In youth (1640—1642), he took part in the sieges of Arras and Perpignan, and commanded

the army against the Spaniards in the Netherlands, where he almost extirpated the foe in the battle of Rocroi, May 19, 1643. In the autumn of the same year, he was sent to Alsace to support Turenne; and in the engagements of August 3 and 5, 1644, he defeated the Bavarian general Mercy near Freiburg, and so won for France a considerable portion of Germany. By the death of his father, 1646, C. became the head of his family, and, next to the Duke of Orleans was the highest personage in the state. This pre-eminence excited the envy of Cardinal Mazarin, who, however, in 1648, intrusted C. with the command of the army in the Netherlands. Here the prince captured Ypres, and gained the battle at Lens, but was called back to Paris by the war of the Fronde (q. v.), which had just broken out. In this contest, C. at first sided with the court, while his brother, Prince of Conti, and his sister, the celebrated Duchess of Longueville, took the part of the *Frondeurs*. After the court had secretly escaped from Paris (January 6, 1649), C. concluded a treaty which insured the return of the court to Paris in August of the same year. But as this service met with no adequate thanks, C., who was the haughtiest Frenchman of his age, soon became more violently rebellious than the Frondeurs themselves, at least in his language and deportment.

Cardinal Mazarin consequently arrested C., with his brother and the Duke of Longueville; but was soon compelled to release him, on account of the threatened operations of Turenne and the Fronde. Though C. now enjoyed the favor of the people, his relations with the court were unfriendly even after Mazarin had been banished, and when Louis XIV assumed the government, 1651. He therefore renewed the war, with, as some suppose, the ambitious view of obtaining the supreme power. At the head of troops collected in the Netherlands, he gained the battle of Bleneau, in April 1652, and immediately marched upon Paris, while Turenne, who had remained steady in his loyalty, advanced to defend the court. A bloody but indecisive struggle took place in the streets of Paris. Many of C.'s ablest adherents, however, were killed, and the Frondeurs began to give in. A treaty was drawn up, to which most of them agreed, but the proud impracticable C. would have nothing to do with it; furious at the defection of so many of his friends, he went into Champagne to gather troops, and after a fruitless effort to seize Paris, he left the country, and, on the formal outbreak of war between France and Spain, became generalissimo of the Spanish forces, but was unable to gain the advantage over Turenne. When the peace of the Pyrenees was concluded between France and Spain, it was thought advisable to enter into friendly relations with the brilliant traitor. C. was therefore pardoned, and reinstated in his former honors. The war having been renewed by Spain, 1673, he again commanded the French in the Netherlands. After Turenne's decease, he held the command in Germany, but was ultimately so disabled by gout, that he had to resign his post. He now retired to his estate of Chantilly, where he devoted his remaining years to literature (for which, in his early years, he had exhibited a strong predilection), the society of friends, and religious exercises. He died at Fontainbleau, December 11, 1686. The Prince of C. had a superior intellect and great strength of character, associated with pride. Though an able commander, he was disliked by the soldiers, on account of his severity.—Mahon, *Life of the Great Condé* (1840).

Condenser.

CONDE'NSER, the apparatus used in conjunction with an electrometer to increase its sensibility, and render it available for indicating the presence of very feeble electricity. A C. of the simplest form is shown in the accompanying figure. A is a gold-leaf electrometer. The condensing apparatus consists of the two brass plates, B and C, which are placed horizontally, the lower one being connected with the metal rod to which the gold leaves are attached, and the upper one being provided with an insulating glass handle. These plates are accurately ground, the one to the other, so that when placed upon each other, they touch in every part.

Their inner surfaces are covered with a very thin and equable layer of shell-lac. When an observation is made, the excited body is brought into contact with the lower plate, and the finger of the observer is laid upon the upper. This being done for a sufficient time, the finger is first removed, and then the excited body, after which the plate C. is lifted by its handle parallel to the other plate, the gold leaves at the same time diverging under the influence of the electricity left in the lower plate. The same observation might have been made with the positions of the finger and the excited body reversed, but the leaves would then be charged with the opposite electricity to that of the excited body. Reverting to the first case, the electricity to be tested is communicated to the lower plate in small successive charges, which, acting through the thin layer of shell-lac, induce, as in the Leyden jar, a corresponding charge of the opposite electricity on the lower surface of the upper plate, and send the similar electricity of the upper plate through the finger into the ground. Each weak charge of electricity given to the lower plate is not allowed to dissipate, but is kept fixed or bound by the corresponding charge of the opposite electricity which it has induced on the upper plate, so that an accumulation of such charges takes place. As yet, however, there is no excitement visible in the gold leaves, the electricity so condensed in the plate B being capable of acting only in one direction—viz., towards the charge of the upper plate. When, however, the plate C. is removed, the collected electricity of the lower plate being no longer restrained to act towards it, immediately extends to the leaves below, and causes a marked divergence. In this manner, electricity of too low a tension to affect immediately the gold leaves can be condensed, so as to possess the power of doing so.

It is found that the efficiency of the C. depends upon the accurate grinding of the plates, the thinness and evenness of the layer of shell-lac with which their inner surfaces are varnished, the size of the plates, and their parallelism on removal. This last is of the utmost importance; and it is found, where numerical results are wanted, that little dependence can be placed on the parallelism attained by the hand. For more accurate observations, the C. is made quite separate from the electrometer. The plates in this case attached vertically to two wooden pillars, on which they are insulated, and which slide in a horizontal groove made in the sole of the instrument. The plates, thus guided by the grooves, are made to approach and to retire from each other with their faces parallel. In a C. of this description, no shell-lac varnish is used, the air between the plates acting as the dielectric in its place. When one of the plates is connected with the knob of the electrometer, the observation proceeds as already detailed.

CONDENSING STEAM-ENGINE. See STEAM-ENGINE.

CONDESCE'NDENCE. In the judicial procedure of Scotland, a C. is an articulate statement of the facts, accompanied with a note of the grounds in law on which the pursuer of an action rests. Formerly, the C. was a separate pleading from the Summons, or judicial writ by which the defender is called into court. By the passing of 13 and 14 Vict. c. 36 (31st October 1850), and several subsequent statutes, the forms in Scotland were very much simplified. The summons, in place of containing a rambling statement of the grounds of action, which was afterwards to be rendered articulate and explicit by the C., is now a merely formal writ, setting forth the name and designation of the pursuer and defender, and the conclusions of the action. To the summons, however, is appended a C. setting forth the grounds of action in articulate statements, and to this again is subjoined a note of pleas in law, so that the whole case of the pursuer is contained in the very first pleading in the cause. The papers on both sides may be revised if necessary; and the record, as the written pleadings and productions are called, is then adjusted by the judge. The cause is then ready for Debate (q. v.).

CONDESCENDENCE AND CLAIM. See MULTIPLEPOINDING.

CONDILLAC, ETIENNE BONNOT DE MABLY DE, a French philosopher of the 18th c., was born at Grenoble, 1715. In early youth, his delicate health delayed his progress in education. In 1746, he published his *Essai sur l'Origine des Connaissances Humaines*, a work which derives all thought and knowledge from the exercise of the senses. It was intended to carry out the principles of Locke, which were misunderstood and misrepresented by C. as entirely based on sensationalism. To refute various metaphysical theories, C. wrote a *Traité des Systèmes* (1749). In 1754, appeared his *Traité des Sensations*—a work supplying the details of the sensational theory. C. supposes a statue organized within like a man, but its body—so to speak—being composed of marble, hinders it from possessing any sensibility. C. further supposes himself to have the power of endowing the statue with one sense after another, until it becomes perfectly a human being, and so endeavors to show that as it would then possess exactly the same kind of ideas as ourselves—and yet while destitute of sensations, possessed none—it logically follows that ideas spring exclusively from sensations. In all his writings, C. displayed acuteness in analysis, and as consistently as was possible, adhered to the extreme theory of sensationalism. C. passed his life mostly in quiet retirement, and died at his estate near Beaugenci, August 3, 1780.

CO'NDIMENTS, or seasoning agents, are those substances which are employed at table for the purpose of imparting a flavor or seasoning to the ordinary solid or liquid food. The greater part of C. are necessary to sustain the proper functions of the alimentary system, and besides gratifying the appetite, minister, more or less, to the wants of the structure. The principal C, are saline substances, such as common salt; acidulous bodies, such as acetic acid or vinegar; oily C., such as butter and olive-oil; saccharine substances, such as sugar and honey; and aromatic and

pungent C., such as mustard, ginger, pepper, and pickles. The members of the last class owe their characteristic properties to the presence of a volatile oil or resin.

CONDI'TION, in Logic, denotes that which must precede the operation of a cause. It is not regarded as that which produces an effect, but as that which renders the production of one possible. For instance, when an impression is made on wax by a seal, the seal is said to be the cause; the softness or fluidity of the wax, a condition. Some logicians, however, are of opinion, that the distinction usually made between C. and cause is arbitrary.

CONDITION. See TRAINING.

CONDITION, in Law. This word is of peculiar importance in the real property law of England, as forming the foundation upon which the right of alienation of land, as well as the system of entails and that of mortgages was raised. Originally, a gift of an estate to a tenant (or vassal) by the lord of the fee did not convey more than a life-estate; and when a gift was made to a man and the heirs of his body, it was held that it was a gift upon C. that he had heirs of his body. But if the C. was performed by his having children, although they might all die before his own death, the judges held that his estate became absolute, to the effect that he might aliene the land, and so bar not merely the succession of his issue, but the right of the lord in default of issue, although, if he did not aliene, the lord would recover in the event of the tenant's death without issue. But it came afterwards to be held that a gift to a man and the heirs of his body conferred what is called an estate tail, which might at once, by certain forms, be converted into an absolute estate, independent of the birth of issue. See ENTAIL.

A mortgage is an estate given to the mortgagee upon C. that he restores it upon payment of a fixed sum borrowed by the mortgager. This is an example of an estate upon C. *expressed*. An estate attached to an office is an estate in the holder of the office upon C. *implied*, that he shall perform its duties. A C. may also be either *precedent* or *subsequent*.

In the former case, the gift does not take effect until the C. is performed; in the latter, it becomes void when the C. occurs. The right to take advantage of a C. subsequent cannot be bestowed on a stranger, but can only be reserved to the grantor and his heirs, though after such reservation it may be assigned to a stranger. Conditions which are incapable of performance, or contrary to law, are void; and if such a C. is precedent, it makes the gift void; if subsequent, the estate becomes absolute in the tenant. But if a C. become illegal, or impossible, subsequently to the making of the grant, it has a different effect, according as the effect is produced by statute or by other circumstances. If by statute, the party bound to perform the C. is relieved from it; if by other circumstances, he loses his right, as being unable to perform the condition.

In contracts, conditions which are *mala in se* render the contract void; but it is otherwise if the C. is merely opposed to an arbitrary rule of law, in which case the C. only is void, and the contract subsists. In legacies, a similar rule prevails. But in the case of legacies, a C. impossible of performance is generally taken *pro non scripto*—whereas in contracts, it commonly annuls the claim of the party who has bound himself to its performance.

CONDI'TIONED, THE PHILOSOPHY OF THE. This phrase has been brought into use by Sir W. Hamilton, to express the inability of the human mind to conceive or reason respecting the Absolute and the Infinite. Our thought, according to him, can only be of the *relative* and the *finite*, of which these terms are but the negations; relativity and finitude are the conditions under which the human intelligence operates. In a dissertation on this subject (*Discussions in Philosophy*, p. 1), he criticises, and endeavors to refute the opposite position as maintained by Cousin—a modification of the previous doctrine of Schelling—that 'the Unconditioned, the Absolute, the Infinite, is immediately known in consciousness, and this by difference, plurality, and relation.'

As this doctrine of Sir W. Hamilton has been raised into an especial importance by Mr. Mansel in his *Bampton Lectures*, some account of the reasonings adduced in its favor may here be given. We shall first quote the author's own statement:

'In our opinion, the mind can conceive, and consequently can know, only the *limited, and the conditionally limited*. The unconditionally unlimited, or the *Infinite*, the unconditionally limited, or the *Absolute*, cannot positively be construed to the mind; they can be conceived only by thinking away from, or abstraction of, those very conditions under which thought itself is realized; consequently, the notion of the Unconditioned is only *negative*—negative of the conceivable itself. For example:

On the one hand, we can positively conceive neither an obsolute whole, that is, a whole so great that we cannot also conceive it as a relative part of a still greater whole; nor an absolute part, that is, a part so small that we connot also conceive it as a relative whole; divisible into smaller parts. On the other hand, we cannot positively represent, or realize, or construe to the mind (as here Understanding and Imagination coincide) an infinite whole, for this could only be done by the infinite synthesis (union) in thought of finite wholes, which would of itself require an infinite time for its accomplishment; nor, for the same reason, can we follow out in thought an infinite divisibility of parts. The result is the same, whether we apply the process to limitation in *space*, in *time*, or in degree. The unconditional negation, and the unconditional affirmation of limitation; in other words, the *Infinite* and the *Absolute, properly so called*, are thus equally inconceivable to us.'—*Discussions*, p. 13, 2d edition.

The fundamental ideas involved in this view are certain observed facts with reference to the human mind, or the human consciousness; which facts, although very much overlooked in former times, are now beginning to be pretty generally recognized. It is a general law of our mental constitution, that change of impression is essential to consciousness in every form. The remark was made by Hobbes, that it is 'almost all one for a man to be always sensible of one and the same thing, and not to be sensible at all of anything.' There are notable examples to show that an unvarying action on the senses fails to give any perception whatever. Take the pressure of the air on the surface of the body. Here we have an exceedingly powerful effect upon one of the special senses. The skin is under an influence exactly of that nature that wakens the feeling of touch, but no feeling comes. Withdraw any portion of the pressure, as with a cupping-glass, and sensibility is developed. A constant impression is thus, to the mind, the same as a blank. Our partial unconsciousness of our clothing is connected with the constancy of the object. Remission or change is, therefore, absolutely requisite in order to sensibility.

The necessity of change in order to produce feeling or consciousness of any sort, must apply to the special kind of consciousness that we call knowledge. To know light, is to pass from its presence to its absence, or the opposite; everlasting, unvarying luminosity, in an eye always awake, would not be known to the human mind. It is transition that develops knowledge, whence flows the important consequence, that knowledge *never can be of one property alone;* there must always be at least two properties in every act of knowing. We may say that we know light; but in so doing we also know darkness, and we could not know either by itself. When we touch clay and marble, we know hard and soft; but if we had never touched a soft body, we should have no conception of a hard one. Living in one constant temperature, like the fish in the tropical seas, we should know neither heat nor cold; passing from a high temperature to a low, or from a low to a high, we know both; and such is the alternative presented in every case to the human understanding. This great fundamental law of the human mind is now commonly designated by the phrase, *the relativity of knowledge or of cognition*.

Mr. Mansel, accordingly, disputes the possibility of our conceiving the infinite, by showing that such a conception passes the limits of human consciousness. The following extracts will show his mode of reasoning: 'Now, in the first place, the very conception of consciousness, in whatever mode it may be manifested, necessarily implies *distinction between one object and another*. To be conscious, we must be conscious of something; and that something can only be known as that which it is, by being distinguished from that which it is not. But distinction is necessarily limitation; for, if one object is to be distinguished from another, it must possess some form of existence which the other has not, or it must possess some form which the other has. But it is obvious that the infinite cannot be distinguished, as such, from the finite, by the absence of any quality which the finite possesses; for such absence would be a limitation. Nor yet can it be distinguished by the presence of an attribute which the finite has not; for, as no finite part can be a constituent of an infinite whole, this differential characteristic must itself be infinite, and must at the same time have nothing in common with the finite. We are thus thrown back upon our former impossibility.'—Lecture 3d.

'A second characteristic of consciousness,' according to Mr. Mansel, 'is, that it is only possible in the form of a *relation*. There must be a Subject, or person conscious, and an Object, or thing of which he is conscious. There can be no consciousness without the union of these two factors; and, in that union, each exists only as it is related to the other. The subject is a subject, only in so far as it is conscious of an object; the object is an object, only in so far as it is apprehended by a subject; and the destruction of either is the destruction of consciousness itself. It is thus manifest that a consciousness of the absolute is equally self-contradictory with that of the infinite. To be conscious of the absolute as such, we must know that an object which is given in relation to our consciousness, is identical with one which exists in its own nature, out of all relation to consciousness. But to know this identity, we must be able to compare the two together; and such a comparison is itself a contradiction. We are, in fact, required to compare that of which we are conscious, with that of

which we are not conscious, the comparison itself being an act of consciousness, and only possible through the consciousness of both objects.

The author then lays down a third condition of consciousness—namely, relation to *time*. Everything conceived by us is conceived as under the two manifestations of *succession* and *duration*, from which he endeavors to show 'that an act of *creation*, in the highest sense of the term—that is to say, an absolutely first link in the chain of phenomena, preceded by no temporal antecedent—is to human thought inconceivable. To represent in thought the first act of the first cause of all things, I must conceive myself as placed in imagination at the point at which temporal succession commences, and as thus conscious of the relation between a phenomenon in time and a phenomenon out of time. But the consciousness of such a relation implies a consciousness of both the related members; to realize which, the mind must be in and out of time at the same moment.

And, further: 'Subordinate to the general law of time, to which all consciousness is subject, there are two inferior conditions, to which two great divisions of consciousness are severally subject. Our knowledge of body is governed by the condition of *space*, our knowledge of mind by that of *personality*. I can conceive no qualities of body save as having a definite local position; and I can conceive no qualities of mind save as modes of a conscious self.'—Lecture 3d.

By the application of those four conditions or limitations of the human consciousness—distinction, relation, succession, and duration in time, and personality as regards the conception of mind—it is Mr. Mansel's purpose to demolish the foundations of the metaphysical theology of former ages, which was largely conversant with proofs *à priori* of the infinity and the absolute existence of a Deity. According to him, a rational theology is impossible to be attained. 'Our whole consciousness manifests itself as subject to certain limits, which we are unable, in any act of thought, to transgress. That which falls within these limits, as an object of thought, is known to us as *relative* and *finite*. The *absolute* and the *infinite* are thus, like the *inconceivable* and the *imperceptible*, names indicating, not an object of thought or of consciousness at all, but the mere absence of the conditions under which consciousness is possible. The attempt to construct in thought an object answering to such names, necessarily results in contradiction—a contradiction, however, which we have ourselves produced by the attempt to think—which exists in the act of thought, but not beyond it—which destroys the conception as such, but indicates nothing concerning the existence or non-existence of that which we try to conceive. It proves our own impotence, and it proves nothing more.'

CONDOM, a town of France, in the dep. of Gers, pleasantly situated on a height on the river Baise, here crossed by two bridges, 25 miles north-north-west of Auch. The town is very old, having been founded in 721, is irregularly built, but has handsome suburbs. It has a handsome Gothic Church, an exchange, and two hospitals. There is a very considerable trade in grain, flour, wine, and brandy, and manufactures of cotton and mixed fabrics, cotton yarn, and earthenware. C. was formerly the capital of an extensive district, now comprised in the departments of Gers, Landes, and Lot-et-Garonne. Bossuet was at one time Bishop of Condom. Pop. (1876) 4933.

CONDONA'TION, in the legal phraseology both in England and Scotland, means forgiveness, or *remissio injuriarum*, when urged as a defence against an action of divorce on the ground of adultery.

CO'NDOR (*Sarcoramphus gryphus*), the great vulture of the Andes, and the largest of known flying birds. Its dimensions, however, were for a long time greatly exaggerated. It is not always much larger than the *lämmergeyer* of the Alps, being sometimes not scarcely more than four feet long, and its expanse of wings about nine feet, although these dimensions are often considerably exceeded, and the expanse of wings reaches fully fourteen feet. The wings are long, and extremely powerful; the tail short, and wedge-shaped; the general color black, which is brightest in old males, the young being of a brownish color, which has given rise to a notion that there are two species; the males are also distinguished by having great part of the wings white. Around the lower part of the neck of both sexes there is a broad white ruff of downy feathers, above which the skin is bare, and exhibits many folds. The head of the male is crowned with a large cartilaginous comb, and the neck is furnished with a dilatable wattle. The beak is thick and strong, straight at the base, but the upper mandible strongly curved at the extremity. The C. feeds mostly on carrion. Its voracity is enormous. Tschudi mentions one in confinement at Valparaiso which ate 18 lbs. of meat in a single day, and seemed next day to have as good an appetite as usual. Condors often gorge themselves so that they cannot fly, and if attacked, must disgorge in order to escape. They inhabit regions 10,000 or 15,000 feet above the level of the sea, where they breed, making no nest, but laying their eggs on the bare rocks, and

Head of Condor.

Condor.

where they are usually seen in small groups. To these haunts they return, after their descents into the plains for food.

The height to which the C. soars in the air exceeds that of any other bird, and is said to be almost six perpendicular miles above the level of the sea, or nearly six times the ordinary height of the clouds.—To the same genus with the C., distinguished by the cartilaginous comb, bare neck, and peculiar shape of bill, belong the King Vulture, or King of the Vultures (*S. papa*), of the warm parts of America, and the Californian Vulture (*S. Californianus*). The king of the vultures is about the size of a goose, and derives its name from its driving away other vultures from prey at its pleasure. Its plumage is finely colored, reddish above, white beneath, with bluish-gray ruff, and black quills and tail. The birds of this genus have no voice, and make only a sort of weak snorting.

CONDORCET, Jean Antoine Nicolas de Caritat, Marquis de, an eminent French author, was born September 17, 1743, at Ribemont, near St. Quentin, in the department of Aisne; studied at the college of Navarre; and by his *Essai sur le Calcul Integral* (afterwards given in an extended form in his *Essais d'Analyze*), gained for himself, at an early age, a seat in the Academy of Sciences. With ease and remarkable ingenuity, C. treated the most difficult problems of mathematics; but though deserving high praise, his powers lay rather in suggestion than in rigorous demonstration. After the appearance of his *Eloges des Académiciens Morts avant* 1699 (Paris, 1773), he was made secretary of the Academy, 1777. His theory of comets gained, in the same year, a prize in the Berlin Academy. In concert with Turgot, he was induced to subject the system of the economists to a close examination, and was led by D'Alembert to take an active part in the *Encyclopédie*. In all his works—as, for example, in the *Eloges et Pensées de Pascal*—we find noble views of human destiny, and evidences of a truly benevolent disposition. At the Revolution, he was elected member for Paris in the Legislative Assembly, of which he was president in 1792. In the National Convention, as deputy for the department of Aisne, he mostly voted with the Girondists, and shared in the downfall of that party. Accused, in October 1793, he concealed himself, and consequently was outlawed.

A generous lady, Madame Verney, had the courage to provide for him a hiding-place, where he remained for some months, and in very miserable circumstances wrote his most remarkable work, the *Esquisse des Progrès de l'Esprit Humain*. Having afterwards quitted his concealment, he was arrested at Clamart, sent to Bourg-la-Reine, and cast into prison. The next morning, March 28, 1794, he was found lying dead on the floor. He had, it is believed, poisoned himself. His collective works (exclusive of his mathematical essays) were edited by Garat and Cabanis (21 vols., Paris, 1804).—His wife, Sophie de C. (sister of Marshal Grouchy), born 1765, assisted in the literary labors of C., and also translated into French, Adam Smith's *Theory of Moral Sentiments*. She died September 6, 1822.

CONDOTTIE'RI, the name given in the 14th c. to the leaders of certain bands of military adventurers who, for booty, offered their services to any party in any contest, and often practised warfare on their own account purely for the sake of plunder. These mercenaries were called into action by the endless feuds of the Italian states during the middle ages. Among the most celebrated

of their leaders were Guarnieri, Lando, Francis of Carmagnola (about 1412), and Francis Sforza (about 1450). The last-mentioned made himself Duke of Milan. The *Compagnies Grandes* in France, during the 14th c., resembled the bands led by the Italian condottieri. They originated in the long bloody wars between France and England. The mischief done by them became so intolerable, that in several parts of the country the peasantry armed themselves, and under the name of *paciféres*, formed associations against the plunderers. Nevertheless, these French C. were so powerful that, in 1361, they routed the king's forces which had been sent against them, at Brignais, near Lyon, and slew the Constable of France, Jacques de Bourbon; but the Constable du Guesclin persuaded them to seek their fortune in the Spanish service.

CONDUCTION. See HEAT.

CONDU'CTOR, in Music, is the person placed at the head of a band of musicians to lead the performance and beat the time. In Germany, the term Dirigent is used, which is more expressive.

CONDUCTORS, in the Royal Artillery, are those artillerymen who have charge of the ammunition-wagons in the field; they are, to some extent, under the control of the commissariat officers, who have to provide means of transport; but since the recent changes in the commissariat department, they have been more exclusively under the control of their own proper artillery officers.

CONDUCTORS AND NON-CONDUCTORS OF ELECTRICITY. If a rod of metal be made to touch the prime conductor of an electrical machine immediately after the plate has ceased to rotate, every trace of electricity immediately disappears. But if the rod were of shell-lac, little or no diminution would be perceptible in the electrical excitement of the conductor. The metal in this case leads away the electricity into the body of the experimenter, and thence into the ground, where it becomes lost, and it receives in consequence the name of a conductor. The shell-lac, for the opposite reason, is called a non-conductor. Different substances are found to possess the power of conducting electricity in very different degrees. The following series classifies the more common substances according to their conducting powers, beginning with the best, and ending with the worst conductors. Conductors—The metals, graphite, sea-water, spring-water, rain-water. Semi-conductors—Alcohol and ether, dry wood, marble, paper, straw, ice at 32° F. Non-conductors—Dry metallic oxides, fatty oils, ice at — 13° F., phosphorus, lime, chalk, caoutchouc, camphor, porcelain, leather, dry paper, feathers, hair, wool, silk, gems, glass, agate, wax, sulphur, resin, amber, shell-lac.

The arrangement into conductors, semi-conductors, and non-conductors, is made with reference to frictional electricity, or electricity of a high tension. The substances which are semi-conductors for frictional electricity are found to be almost, if not altogether, non-conducting for the electricity of the galvanic battery, which is too feeble to force a passage through them. The metals, which appear to be all nearly alike conducting for frictional electricity, offer widely differing resistances to the transmission of the galvanic current. By experiments made with galvanic electricity, it is found that the more ordinary metals stand thus, as regards their powers of conduction, beginning as before with the best conductor: Silver, gold, copper, brass, zinc, iron, platinum, tin, nickel, lead, German-silver, mercury. An increase of temperature has in the metals the effect of lessening the conducting power, whilst in almost all other substances it has an opposite effect. Glass becomes conducting at a red heat, and so do wax, sulphur, amber, and shell-lac, when fused.

When a conductor is placed on non-conducting supports, so as to prevent the electricity communicated to it from passing into the ground, it is said to be insulated. The usual insulating material employed in the construction of electrical apparatus is glass, which, though not so perfect a non-conductor as the others lower in the scale, far exceeds them in hardness and durability. In a damp atmosphere, glass becomes coated with a thin layer of moisture, which very considerably diminishes its insulating power. Hence arises the necessity in certain states of weather of heating so as to dry all electrical apparatus previous to use. This imperfection is very much lessened by covering the glass with shell-lac varnish.

The very fact that a conductor may be insulated, indicates that the air is a non-conductor. Dry air possesses this property in a high degree, while moist air renders insulation for any length of time impossible.

CONDY'S FLUID. See MANGANESE.

CONE (*strobilus*), in Botany, a fruit-bearing spike covered with scales, each of which has two seeds at its base. Such are the fruits of the *Coniferæ* (fir-cones or fir-tops), from the usual shape of which the name C. is derived, also the fruits of the *Casuarineæ*. The name C. is applied also to the female spike, even when in flower. The scales of true cones, until they separate to allow the dispersion of the seeds, are closely compacted together; in the hop, to the fruit of which the name C. is not applied, although *strobilus* is, they are loose. Some true cones, as those of the *Araucaria*, are very far from being conical in shape. The fruit of the juniper (a *galbulus*) is a C. of which the scales have become fleshy, so as to form a false berry.

CONE. There are various kinds of cones, but the term is usually applied only to those having circular bases. The most common kind of circular C. is the *right* C., which may be conceived as being generated by the revolution of a right-angled triangle round one of its legs. The line from the apex of a C. to the center of the base is called the axis, and, in the right C., it is perpendicular to the base. In the *oblique* C., the axis is inclined to the plane of the base at an angle other than a right angle. A *truncated* C. is the lower part of a C. cut by a plane parallel to the base.—Four curves, called the CONIC SECTIONS, may be formed by cutting the right C. in different directions. If the C. be cut by a plane parallel to the base, the section is a circle; if the plane cut the C. across, making any angle other than a right angle with its axis, the section is an ellipse; if the cutting plane be parallel to the side of the C., the section will be a parabola. In every other case than those stated, the section will be an hyperbola. If two cones were set one above the other, the one being just a continuation of the other through the apex, the plane producing the hyperbolic section would cut the second as well as the first, though none of the other planes would. There are thus two equal branches of the hyperbola belonging to the two cones respectively. See CIRCLE, PARABOLA, &c.

CONEGLIA'NO, a town of Northern Italy, 28 miles north-east of Venice. It is situated on a hill-slope, crowned by an extensive castle, and has a very picturesque appearance. Half-obliterated frescoes adorn the outside of several houses in the town. C. has manufactures of woollens and silks, and a population of 6500.

CONE-SHELL (*Conus* and *Conidæ*), a genus and family of gasteropodous mulluscs, of the order *Pectinibranchiata*, having a shell of remarkably regular conical form; the spire on the base of the cone, and sometimes rising from it to a sharp point; sometimes almost flat; the aperture narrow and straight, without protuberance or fold, extending from the base of the cone to its apex. The head of the animal has a proboscis capable of much extension; the mantle is scanty and narrow, forming an elongated siphon in front; the shell covered with an epidermis. These molluscs are carnivorous, they inhabit shores and banks of sandy mud, chiefly within the tropics, a few only occurring in the Mediterranean. The shells of many species are very beautiful, and much prized by collectors.—Cone-shells first appear in the chalk, and become more abundant in the more recent formations.

Cone-shell.

CONFARREA'TION was a peculiar mode of marriage in use among the Romans, and supposed to have been originally that practised by the patricians. Its specialty consisted in the employment of certain words in the presence of ten witnesses, and in the performance of a religious ceremony in which *panis farreus* (bread made of spelt) was used. Various priestly offices, such as that of the *Flamen Dialis*, were open only to those who were born of parents thus married.

CONFEDERA'TION, GERMANIC. See GERMANY.

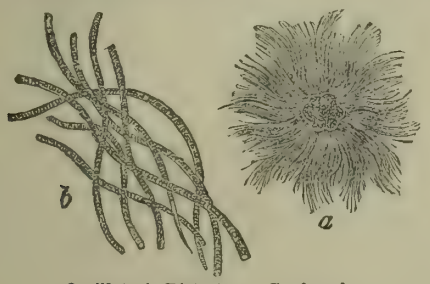
CONFEDERATION OF THE RHINE. During the war of 1805, so disastrous for Austria, several German princes, too weak to remain neutral, were forced to ally themselves with France. The first to do so were the Electors of Bavaria and Würtemberg, who, in recompense for their services, were elevated to the dignity of kings by the peace of Presburg, 26th December 1805. Some months after (28th May 1806), the arch-chancellor of the empire announced at the diet that he had chosen as his coadjutor and successor Cardinal Fesch, the uncle of Napoleon, a thing entirely contrary to the constitution of the Germanic empire. Finally, at Paris, on the 12th July 1806, 16 German princes formally signed an act of confederation, dissolving their connection with the Germanic empire, and allying themselves with France. These 16 princes were—the kings of Bavaria and Würtemberg, the arch-chancellor, the Elector of Baden, the new Duke of Cleves and Berg (Joachim Murat), the Landgraf of Hesse-Darmstadt, the Princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm, Salm-Kryburg, the Duke of Arenberg, the Princes of Isenburg-Birstein and Lichtenstein, and the Count of Leyen. These individuals justified (or were forced to justify) their conduct by enumerating the vices of the constitution of the Germanic empire, and invited the remaining princes of Germany to imitate their example. At the same time, Bacher, the French ambassador, declared that his master no

longer recognized the Germanic empire; while the territories and titles of the confederate princes (who were now under the protectorate of Napoleon) underwent considerable changes. In addition to these changes, a number of other princes and nobles of the empire were made dependent (see MEDIATISATION) on the confederation. During the years 1806—1808, several other petty German sovereigns, alarmed at the triumphs of Napoleon, hastened to enrol themselves members of this unpatriotic league; and at the close of 1808, it embraced a territory of 122,236 square miles, contained a population of 14,608,877 souls, and kept up an army of 119,180 men. The utter ruin which overtook the French army in the Russian campaign acted like a solvent on the confederation, and the year 1813 saw it vanish like mist in the sudden outburst of German patriotism, when a whole people leaped up as one man, and delivered themselves from a cruel and insulting bondage.

CO'NFERENCE, in English Law, signifies the interview of an attorney or solicitor with a counsel, when consulting him. Consultation properly means the meeting of barristers with each other.

CONFERENCE, WESLEYAN. See METHODISTS.

CONFE'RVA, a genus of plants of the natural order *Algæ*, suborder *Confervaceæ* (or order *Confervaceæ*). The plants of this genus consist of simple or branching jointed filaments, which are filled with green—seldom purple or red—matter, and are found in abundance in water—some of them in fresh, and some in salt water—and on moist earth. *C. rivularis*, a species common in brooks, is sometimes 2—4 yards in length, and was formerly used as an application to wounds and slight burns. This and other species are sometimes called *Crow Silk*, and are used in some places for stuffing mattresses. *C. rupestris* often covers whole rocks on the sea-coast.



Oscillatoria Distorta; a Conferval:
a, natural size; *b*, magnified.

C. crispa sometimes forms a close entangled layer on inundated land, and has received the name of *Water Flannel*. *C. ægagropila*, sometimes called *Moor Ball*, is found in lakes and ponds, where it floats about freely in the water, its filaments forming an entangled ball, capable of being employed as a pen-wiper.—The name C. is not always strictly limited to the genus, but is extended to many of its near allies. Among the *Confervaceæ*—or Confervals—however, are included many plants, as the different kinds of Laver, which have a flat, and not a thread-like frond. Many also consist of cells immersed in a slimy matter. The *Confervaceæ* grow by the division, and sometimes by the branching of cells; reproduction takes place by *spores*, formed in the interior of the cells, and which at last are discharged through the walls of the mother-cell. The very interesting phenomenon of the Conjugation (q. v.) of cells has been observed in them. The spores assume the character of Zoospores (q. v.), exhibiting movements which resemble those of animals, before leaving the mother-cell, and retain this character for some time after escaping from it. *Confervaceæ* are found plentifully even in mineral waters. Their great abundance often gives a color to the whole water of tanks, marshes, &c. The Red Sea is said to derive its name from the color sometimes given to the surface of its waters, for distances as great as the eye can reach, by small *Confervaceæ*. The yeast-plant has been ranked among *Confervaceæ*, but is more generally regarded as one of the *Fungi*. Other vegetable organisms which appear in liquids of the most various kinds, and which have also been ranked among *Confervaceæ*, are more probably the *mycelium* of imperfectly developed *Fungi*. The plants noticed in the article ALGÆ as appearing in diseased conditions of animals, are regarded as *Confervaceæ*.—The Lavers are almost the only *Confervaceæ* ever used for human food.

CONFE'SSION, in Roman Catholic theology, means a declaration of sins to a priest in order to obtain absolution. The practice of C. is believed by Roman Catholics to be of divine institution, being founded on the power of binding and loosing from sin conferred on the apostles by Christ (Matt. xvi. 19, xviii. 18, and John xv. 22, 23). The power of binding *or* loosing, being in the view of its advocates judicial and discretionary, presupposes a confession of sins in order to its being judicially exercised. Although some allusions to C. are found in the New Testament, Catholics do not allege any formal scriptural precept for it, but they contend that the above passages contain an implied precept, which they further support by testimonies of the Fathers. Though the apostle James recommends that Christians should confess their 'faults one to another,' yet formal and open C. appears to have been first required in cases where persons guilty of gross apostasy desired to be again received into the church. Motives of piety, and a wish to avoid the scandal of open C., led gradually to the institution of private C. in the hearing of a priest. In and after the 5th c., such C. was made an indispensable preparation for receiving the sacrament of the Lord's Supper. Open or public C., which was part of the discipline of public penance, ceased when that discipline went into disuse. Private C. has been retained, and though its defenders hold it to have been at all times in use, a general law was enacted by the fourth Council of the Lateran (can. xxi., *Omnis utriusque sexus*), requiring that every Christian who has attained the years of discretion should confess to a priest approved for the purpose, at least once in the year; and they insist that this law was by no means the origin of the precept of C., but merely defined the time of its fulfilment. C. is one of the three 'acts of the penitent'—contrition, confession, and satisfaction—which the Council of Trent declares to be parts of the sacrament of penance. The sinner is required to confess each and every mortal sin, in thought, word, and deed, which, after diligent examination of his conscience, has occurred to his memory. He is exhorted, but not required, also to confess Venial Sins (q. v.), especially if they be habitual. C., in order to be fruitful, must be accompanied by contrition and a purpose of amendment. It commonly embraces the sins committed since the last C.; but may include a longer period, and even the entire life. In the latter case, the C. is called general. It is called 'auricular,' as being made to the private 'ear' of the priest; and is ordinarily spoken, but in cases of necessity may be made in writing, by signs, or even by an interpreter. Priests cannot validly receive confessions in any place without the 'approbation' of the bishop of the place, which may be given either absolutely or with restrictions. C. is prescribed in the ritual of the Greek, the Russo-Greek, the Coptic, the Syrian, and the other oriental churches. In most of these churches the practice is obligatory, but in some it has gone into disuse.

The Lutheran Church professes (according to the 11th art. of the *Augsburg Confession*) 'that private confession must be retained in the church; but that full and particular statement of *all* sins is not necessary, because, according to Psalm xix. 12, it is impossible.' In the Apology of the Augsburg Confession, it is said to be 'impious' to abolish the practice of private C. to the priest; but in practice, the Lutheran Church has widely departed from these rules. The Reformed Church (in Germany) has always been more inclined to general C.; and the United Church also substitutes for private C. certain devotional exercises previous to communion. The Church of England employs a general form of C. and absolution in its morning and evening services, but retains private C. in the rubric for visitation of the sick. The Scotch churches do not recognize it at all.—The *Sigillum Confessionis* ('seal of confession'), both in the Roman Catholic and in the German Protestant Church, means the obligation of a confessor or priest not to divulge the secrets of the confessional. This custom of secrecy is traceable in the 4th and 5th centuries, but was made binding by Innocent III. in the 12th, and its violation by a priest makes him subject to the severest penalties that can be inflicted by the church. See CONFIDENTIALITY.

CONFESSION, in Law, is the admission of his guilt by an accused person. In England, proof of C. is sufficient to warrant a jury in convicting without more evidence; in Scotland, some corroborating circumstance must be proved. In both countries, however, the C., to be admissible, must have been made without any promise or threat held out to induce it. As to C. on trial, see PLEA OF GUILTY; and as to C. before the examining magistrate, see DECLARATION.

CONFESSION AND AVOIDANCE, in pleading at common law, in England, is the admission of the allegation of the opposite party, but with the addition of some circumstance which deprives it of legal effect, as, for instance, the admitting that an assault was committed as alleged, but with the assertion that it was committed in self-defence. See PLEADING.

CONFESSION, JUDGMENT BY, in England, is judgment against a defendant on his confessing both the facts and law alleged by the plaintiff. An agreement to confess judgment is a common mode of securing money, but is subject to strict technical regulations.

CONFESSION OF FAITH. See CREEDS AND CONFESSIONS.

CONFE'SSIONAL, the seat or recess in which the priest sits to hear confession in a Roman Catholic church. It is probable that the confessionals in English churches, previous to the Reformation, like those still found in Catholic use, were slight wooden

erections, because they have so entirely disappeared that their form is a matter of dispute among ecclesiologists. It would seem that confessionals were not always used, as in an old painting on the walls of St. Mary's Chapel, Winchester, a woman is represented kneeling to a priest, who is seated in his stall. The confessional commonly has a door in front for the priest to enter by, and an opening on one or both sides, like a small window, with a grating of wire or zinc, for the penitents to speak through.

CO'NFIDENT PERSON. See INSOLVENCY.

CONFIDENTIALITY, in Law. The most common instance of C. is in the case of those communications between a client and his legal adviser, which neither of them can be called on to produce in a suit, and upon which no action of damages can be founded. The privilege extends to letters written by the lawyer to his client, relating to a suit which is either pending or contemplated; but to what extent it covers other business communications, is a question on which there are conflicting authorities in Scotland. In England, the rule has received a liberal interpretation (Dickson on *Evidence*, p. 930). The same privilege is extended to the communications of several parties, or of their counsel and agents engaged on the same side of a cause, and made with a view to their joint prosecution or defence. Where a party, placed in such circumstances, is examined as a witness, he will be entitled to decline answering questions as to such communings, and even bound to do so, unless the privilege is waived by the other party interested (Dickson, p. 924). The principle on which this privilege rests, as stated by Stephen (*Com.* iii. 466), is that these communications are made 'on such lawful occasions as tend to rebut the *primâ facie* inference of malice, which otherwise arises from a statement derogatory to private character.' It is on the same principle that a master is protected who, when called upon for the character of a servant, charges him with a theft. In such cases, in order to support an action, there must be proof of malice beyond the uttering of the words. With a view to preserving the freedom of domestic intercourse, and from a belief that the testimony of near relatives in favor of each other was worthless, and that the only effect of examining them against each other was to tempt them to commit perjury, it was formerly the habit to reject them as witnesses. The practice in England, for a long time, however, has been to admit, and even to exact their evidence, making allowance, in appreciating its value, for the circumstances in which they are placed. The same principle has latterly been followed in Scotland; and the only exceptions which have been retained by the law of Evidence Acts, 15 and 16 Vict. c. 27, 16 and 17 Vict. c. 20, to the now almost universal admissibility of witnesses, are, that neither the parties themselves, nor their husbands or wives, shall be competent or compellable to give evidence in criminal proceedings in which they are accused, nor to answer questions in a civil suit tending to criminate themselves or each other, or to reveal matters which they have communicated to each other during marriage. The C. of such communications remains although the marriage has been dissolved by death or divorce (Dickson, p. 924).

From very early times, so early, it is said, as the 4th and 5th centuries, the 'Seal of Confession' (*sigillum confessionis*) was held to be inviolable, and no priest could be called upon, under any circumstances, to reveal facts which had been confided to him under its sanction. To this the case of treason was an exception, in England, even in Roman Catholic times (Best's *Law of Evidence*, p. 737). In Roman Catholic countries, the privileges of the confessional remain unaltered; and several of the Protestant churches of Germany having sanctioned the practice of confession, the privilege of secrecy has been extended to it, as a necessary consequence, by the civil power. In these states, however, in addition to imposing far lighter penalties upon those clergymen who shall break the seal, the duty of doing so is enforced in all cases in which the confession has reference to a future crime. In England, no special privilege whatever is extended to the Roman Catholic confessional; and the question as to how far a confession made to a clergyman for the purpose of obtaining spiritual comfort and consolation is protected, was long considered doubtful. The rule has, however, been settled for some time that no clergymen of any religious persuasion are entitled to the same privilege as legal advisers; though it has often been advocated as advisable to extend the rule to clergymen, including Roman Catholic priests. In Scotland, however, the point has never been directly or solemnly decided, evidence of the kind in question, when not indispensable for the ends of justice, being generally either withheld or withdrawn (Dickson, ii. p. 938). By a statute of the state of New York, United States ministers of the Gospel and priests of every denomination, are forbidden to disclose confessions made to them in their professional character; and a similar statute exists in Missouri. It has been decided in England, that communications to a medical man, even in the strictest professional confidence, are not protected from disclosure (Best, 734); and the same is the case in Scotland (Dickson, ii. p. 940); but a contrary rule has been adopted in several of the states of America (1 Greenl., § 248, note).

CONFIRMA'TION, in English Law, is where the party having right to land, grants to the party having possession that which is in him. Confirmation, in Scots law, is the form in which a title to administer is conferred on the executor of a person deceased. It must be gone through, or 'expede,' before the commissary of the district.

CONFIRMATION, a Latin word which signifies *strengthening*. In the ancient church, the rite so named was administered immediately after baptism, if the bishop happened to be present at the solemnity, which is still the custom in the Greek and African Churches. In the Roman Catholic Church, for the last 300 or 400 years, the bishops have interposed a delay of seven years after infant baptism; in the Lutheran Church, the rite is usually delayed for from 13 to 16 years; and in the English Church, from 14 to 18 years. There is, however, in the latter church no limit to the period. C. may be administered at an earlier period, if a family is about to emigrate; and persons are confirmed up to 60 or 70, if they choose. The ceremony consists in the imposition of hands by the bishop, accompanied by an invocation of the Holy Ghost as the comforter and strengthener. But both in the Lutheran and English Churches, the ceremony is made the occasion of requiring from those who have been baptized in infancy, a renewal in their own persons of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from their responsibility. None can partake of the Lord's Supper, in these churches, unless they have been confirmed. In the Roman Catholic Church, C. is held to be one of the seven sacraments, and in its administration, unction and the sign of the cross are used; and instead of the imposition of hands, the person confirmed receives a little blow on the cheek, to remind him that he must in future suffer affronts for the name of Christ. In the English Thirty-nine Articles, C. is declared not to be one of the sacraments, and the above ceremonies have been discontinued since the Reformation.

CONFISCA'TION, forfeiture of lands or goods to the crown, as part of the punishment for certain crimes. See ESCHEAT.

CO'NFLICT OF LAWS. On the breaking up of the Roman Empire into separate kingdoms, as many systems of jurisprudence, more or less dissimilar, arose, and were administered side by side. But owing to commercial intercourse and intermarriage, many persons held property in more countries than one; many possessed two nationalities by birth, and more than two—if nationality could be acquired by residence and interest in a foreign state. In such circumstances, it often became an object of the utmost importance to individuals to ascertain, and of greatest difficulty to lawyers to determine, whether the laws of one state or of another were to govern questions of sale, succession, status, and the like. As no state could vindicate its jurisdiction beyond its own boundaries, without being guilty of an act of aggression, it became absolutely indispensable that certain general rules should be fixed upon in order to prevent the danger of national hostilities on trifling occasions.

The elaboration of these rules constituted a new branch of jurisprudence, to which the title of the C. of L. has been given, but which would be more accurately described as the rules for the solution of that conflict. From the partially independent character which belongs to the different states which constitute the American Union, the labors of the continental jurists in international jurisprudence have been carefully adapted to the requirements of that country; and it is consequently to America and to continental Europe, rather than to the writers of our own country, that we must look for works of importance on this subject. By American writers, the term C. of L. has usually been confined to that branch of the law of nations which treats of the rights and duties of private individuals, and it is consequently synonymous with what elsewhere is called private international law, under which head its various rules will be enumerated in this work. See INTERNATIONAL LAW, PRIVATE; COMITY OF NATIONS. See Story's *Conflict of Laws*.

CONFO'RMABLE STRA'TA are beds which lie parallel to each other.

CONFRONTÉ, in Heraldry, means facing or fronting one another. It is the same as combatant.

CONFU'CIUS, a celebrated Chinese sage, was born 19th June 551 B.C., at Shang-ping, near the town of Tséuse, in the petty kingdom of Lu. His own name was Kong, but his disciples called him Kong-fu-tse (i. e., 'Kong, the Master or Teacher'), which the Jesuit missionaries Latinized into Confucius. His mother used to call him Kiéu ('little hillock'), because he had an unusual elevation on the top of his forehead, with which he is often represented. Various prodigies, as in other instances, were, we are told, the forerunners of his birth. An illustrious pedigree has also been invented for him by his fond disciples, who derive his origin from Hoang-ti, a mythological monarch of China who flourished more

than 2000 years B.C. His father, Shuh-leang-ho, died when C. was only three years of age, but he was very carefully brought up by his mother, Yan-she, and from his earliest years, displayed an extraordinary love of learning and veneration for the ancient laws of his country. The prudence, rectitude, and philosophic gravity of his conduct while a boy, are also highly extolled by Chinese writers. At the age of 17, he was made an inspector of the corn-marts, and distinguished himself by his industry and energy in repressing fraud, and introducing order and integrity into the whole business. When only 19, C. married, but divorced his wife four years after marriage, that he might have more time for study and the performance of his public duties. C. was next appointed inspector-general of pastures and flocks, and the result of his judicious measures, we are told, was a general improvement in the cultivation of the country and the condition of the people.

The death of his mother, which happened in his 23d year, interrupted for a time his administrative functions, and gave occasion to the first solemn and important act of C. as a moral reformer. According to the ancient, but then almost forgotten laws of China, children were obliged to resign all public employments on the death of either of their parents; and C., desirous of renewing the observance in his native land of all the practices of venerable antiquity, did not fail to conform to this long neglected enactment. The solemnity and splendor of the burial ceremony with which he honored the remains of his mother (another old custom which had fallen into disuse), struck his fellow-citizens with astonishment, and they determined, for the future, to bury their dead with the ancient honors. Their example was followed by the neighboring states, and the whole nation, except the poorest class, has continued the practice to the present day. C. now came to be looked upon as an authority in regard to the past, and ventured to speak as such. He inculcated the necessity of stated acts of homage and respect towards the dead, either at the grave, or in a part of the dwelling-house consecrated for the purpose. Hence, 'the hall of ancestors,' and anniversary feasts of the dead, which now distinguish China as a nation. C. did not end here. He shut himself up in his house to pass in solitude the three years of mourning for his mother, the whole of which time he dedicated to philosophical study. We are told that he reflected deeply on the eternal laws of morality, traced them to their source, imbued his mind with a sense of the duties which they impose indiscriminately on all men, and determined to make them the immutable rules of all his actions. Henceforth, his career is only an illustration of his ethical system. He commenced to instruct his countrymen in the precepts of morality, exhibiting in his own person all the virtues he inculcated on others. Gradually his disciples increased, as the practical character of his philosophy became more apparent. After his 'years of mourning' and meditation were over, C. traveled through various states, in some of which he was employed as a public reformer. On his return to Lu, his reputation was very great, not less than 500 mandarins being among his followers. In fact, it is to be observed, that generally C.'s disciples were not the young and enthusiastic, but men of middle age, sober, grave, respectable, and occupying important public situations. This fact throws light both on the character and design of his philosophy. It was *ethical*, not *religious*, and aimed exclusively at fitting men for conducting themselves honorably and prudently in this life. C. now divided his scholars into four classes: to the first, he taught morals; to the second, rhetoric; to the third, politics; and to the fourth, the perfection of their style in written compositions. While residing at Lu, C. worked industriously in the revision and abridgment of those works which constituted the principal monuments of that ancient literature about which he was always speaking in the language of unbounded reverence.

An unworthy change of magistrates, however, in the kingdom of Lu induced C. to recommence his travels. He first proceeded to Chen, where he was not much appreciated; and afterwards to Tze, where he became one of the king's ministers, but was dismissed after a short time through the intrigues of cunning courtiers. On his return to Lu, he was appointed 'governor of the people.' For a time, his inflexible virtue awed them into morality, and the delighted monarch conferred the highest dignities on the philosopher; but the arrival of a bevy of beautiful syrens from a neighboring state, which hated the increasing purity of Lu, suddenly overturned the edifice of morality which C. was constructing; and in despair, he again went abroad in search of less vacillating disciples. His later wanderings were very unpropitious; state after state refused to be improved. He was in some instances persecuted, once he was imprisoned and nearly starved; and finally, seeing no hope of securing the favorable attention of the mass of his countrymen while alive, he returned in extreme poverty to his native state, and spent his last years in the composition of literary works by which posterity at least might be instructed. He died 479 B.C., in the 70th year of his age. Immediately after his death, and notwithstanding the general demoralization of his contemporaries, C. began to be venerated, and succeeding ages adorned his name with golden epithets. His family, which has continued to the present day, through more than 70 generations, in the very place where their ancestor lived, is distinguished by various honors and privileges, being the only example of hereditary aristocracy in China, while in every city down to those of the third order there is a temple to his honor. The 18th day of the second moon is kept sacred by the Chinese as the anniversary of his death.

The system of C. is rightly considered, the most faithful expression of the Chinese mind, although it is neither the oldest of the extant Chinese religions, nor that which can claim the greatest number of adherents. We have termed it a *religion*, but it ought rather to be regarded as a system of social and political life built upon a slight foundation of philosophy. It contains no trace of a personal God. There are, indeed, a number of allusions to a certain heavenly agency or power, *Shang-te*, whose outward emblem is *Tien*, or the visible firmament; but this Shang-te in the opinion of the most enlightened Chinese scholars, is nothing more than a verbal personification of 'the ever-present Law and Order and Intelligence, which seem to breathe amid the wonderful activities of physical creation, in the measured circuit of the seasons, in the alternation of light and darkness, in the ebb and flow of tides, and in the harmonious and majestic revolutions of the heavenly bodies.' Sometimes, indeed, C. uses language that might seem to imply more than this. In one of the sacred books, Shang-te is depicted as possessing a high measure of intelligence, and exercising some degree of moral government; he punishes the evil, rewards the good, and is honored with sacrifice.

Immediately after, however, we are informed that his retinue consists of the six Tsong, the mountains, the rivers, and the spirits generally. Elsewhere, the people are enjoined 'to contribute with all their power to the worship of Shang-te, of celebrated mountains, of great rivers, and of the "shin" (spirits) of the four quarters.' Hence we are forced to the conclusion, that C. no more believed Shang-te to be a personal being, than he believed the mountains to be such; and that in describing this Power as possessed of intelligence, and as exercising a moral government, he simply spoke in a pictorial and symbolic way of the laws that govern all things. Perhaps, too, a dim consciousness of a mysterious inexplicable *life* pervading the phenomena and operating through the laws of nature—a feeling probably absent from no human soul—influenced C. to use words which his understanding would not have interpreted in a very literal manner. His highest conception of God, therefore, only reminds one of the *anima mundi* of the classical philosophy; and even this conception is not always present. More than once, his language indicates doubt as to the existence of this great abstraction, and he occasionally 'reprimanded his disciples for prying into matters unconnected with their duties and lying far beyond their depth.' In fact, from metaphysics and theology he equally shrunk. The idea of a creation out of nothing by an infinite and eternal Person, to the end that the glory of his perfections might be seen and felt through the magnificence of material symbols by those intelligences whom in his beneficent condescension he had deigned to create, is utterly unknown to Confucius. He looked on the universe rather as a stupendous self-sustaining mechanism. He thought that all things existed from eternity, and were subject to a flux and reflux, in obedience to initial laws impressed upon them, how and why, we know not, by some stern necessity. Thus, chaining to the earth, as it were, 'those thoughts that wander through eternity;' crushing, in fact, every spiritual tendency of human nature, by repudiating all speculation, and well-nigh all philosophic investigation of every kind, C. strove to direct the attention of men to the duties of social and political life. 'I teach you nothing,' he says, 'but what you might learn yourselves—viz., the observance of the three fundamental laws of relation between sovereign and subject, father and child, husband and wife; and the five capital virtues—universal charity, impartial justice, conformity to ceremonies and established usages, rectitude of heart and mind, and pure sincerity.' This, in fact, contains the whole doctrine of C.; and it was unquestionably well suited to the prosaic, practical, and conservative mind of the Chinese.

It was by the strict and faithful performance of appointed duties, and by the cultivation of proper feelings and sentiments, that C. believed wisdom or knowledge could alone be obtained. He seems to have entertained no doubt that the great virtues of charity, justice, and sincerity might be developed without the help of any spiritual or religious faith, by a species of mechanical discipline. They were natural to the mind, he thought, just as their opposites were unnatural. Here, again, we find a striking example of that easily satisfied unphilosophic *materialism* which characterized C., and has since leavened the Chinese nation so thoroughly. He virtually says: 'Just as I am forced to accept the phenomena of the universe as *facts*, though I can give no explanation of their origin, so am I forced to accept the phenomena of the human mind as *facts*, though I can give no explanation of *their* origin.' C. finds evil and good, wisdom and folly, in the

hearts of men. He cannot help making this distinction; some things are bad, others good; such is the oracular utterance of his conscience, which he terms 'the light of intelligence.' He does not, however, advance a step further, and he makes this moral conviction the basis of a religion. His 'good' has no connection with any God. It exists; we are forced to recognize it as such; that is all we can know. Cultivate it. Those great laws of nature about which we know nothing except that they are realities, are on its side. Do not foster what you know to be mean and unworthy, for 'he who offends against Heaven has no one to whom he can pray.' 'Imperial Heaven will only assist virtue.' From this stand-point, C. taught a simple and comprehensive rule of life, both private and public. First, let every man govern himself according to the sacred maxims; then his family according to the same; and finally, let him render to the emperor, who is the father of his people, such filial obedience as he demands of his own children, and worship him with the same veneration as he does his own ancestors; for thus will domestic peace, social order, and the safety of the commonwealth be preserved. To further this end (and in accordance with his belief that by instruction in the sacred precepts everything desirable could be accomplished), C. inculcated the necessity of universal education, and, in consequence, schools are diffused throughout the length and breadth of the empire, penetrating even to the remotest villages, where the maxims of the philosopher are taught, whose influence is thus perpetuated from generation to generation.

Confucianism appeals to 'practical' men. It lauds the present world; rather doubts, than otherwise, the existence of a future one; and calls upon all to cultivate such virtues as are seemly in citizens—industry, modesty, sobriety, gravity, decorum, and thoughtfulness. It also counsels men to take part in whatever religious services have been established from of old. 'There may be some meaning in them, and they may affect your welfare in a way you do not know of.'

As for the genii and spirits, sacrifice to them: I have nothing to tell regarding them, whether they exist or not; but their worship is part of an august and awful ceremonial, which a wise man will not neglect or despise.' Confucianism, in consequence, almost immediately after the death of its author, became the religion of the state, to which it has proved an admirable ally; its theory of government being nothing less than a paternal despotism. The entire literary class in China are also followers of C., and, in fact, for many ages the literature of China has consisted exclusively of commentaries on the five canonical books which C. professed to merely abridge, and of four others, which were composed partly by himself and partly by his disciples, and which, together with the former, constitute the nine Chinese classics.

The five canonical books are the *Yih-king*—originally a cosmological essay, now, curiously enough, regarded as a treatise on ethics; the *Shu-king*—a history of the deliberations between the emperors Yaou and Shun, and other personages called by C. the *Ancient Kings*, and for whose maxims and actions he had the highest veneration; the *Shi-king*—a book of sacred songs, consisting of 311 poems, the best of which every well-educated Chinaman gets by heart; the *Le-king*—the Book of Rites, the foundation of Chinese manners, prescribing, as it does, the ceremonies to be observed in all the relationships of life, and the great cause of the unchangeableness and artificiality of Chinese habits; and the *Chun-tsien*—a history by C. of his own times, and those which immediately preceded him. The first of the 'Four Books' is the *Ta-hëo*, or 'Great Study,' a political work, in which every kind of government, from the domestic to the imperial, is shown to be essentially the same—viz., parental; the second is *Chung-yung*, or 'the Invariable in the Mean,' a book devoted to teaching men what is 'the due medium,' or the golden mean, to observe in their conduct; the third is the *Tung-yu*, or 'Philosophical Dialogues,' containing the recorded conversations of C., and the best book for obtaining a correct knowledge of his character; and the fourth is the *Hi-tse*, written by Meng-tse, or Mencius, who died 317 B.C., and who was by far the greatest of the early Confucians. The main object of this work is to inculcate philanthropic government.

It is proper to observe, in conclusion, that in the course of centuries the defects of the system of C. made themselves felt even to the unspiritual Chinese mind; and the necessity of 'speaking out far more plainly, not on matters of finance, economy, and etiquette, but on the nature of the world and its inhabitants, and the true relation of the seen and temporal to the absolute and the all-embracing, was recognized.

The philosopher who guided this great movement to a prosperous close was Tehu-he (died 1200 A.D.), is termed by European scholars the Chinese Aristotle, and regarded by all the governing class in China as 'the prince of science.' His innumerable works are laboriously studied by the higher literary class, and are considered the standard of metaphysical or religious orthodoxy, but the mass of ordinary Confucians never pass beyond the ceremonial ethics of their master.

See CHINESE EMPIRE; Legge's *Life and Teachings of C.* (1867), and *Religions of China* (1880); Douglas's *Confucianism and Taouism* (1880).

CONGÉ D'ÉLIRE (Norman-French), the name given in England to the king's warrant or permission to a dean and chapter to proceed to the election of a bishop to a vacant see. Since the passing of the statute 25 Henry VIII. c. 20, the C. d'É. has always been accompanied by a letter-missive from the king, mentioning the person to be elected by name, so that in reality it is a nomination by the crown. If the dean and chapter delay the election beyond twelve days, the nomination is effected by letters-patent from the crown; if they delay beyond twenty days, or elect another than the person named, they incur the penalties of a *præmunire*, i. e., loss of civil rights, forfeiture of their goods, and imprisonment during the royal pleasure.—Stephen's *Commentaries*, vol. iii. p. 8.

CO'NGER, or CO'NGER-EEL (*Conger*), a genus of marine fishes of the eel family (*Murænidæ*), having the tail more elongated and pointed than the fresh-water eels, the dorsal fin commencing much nearer the head, and the teeth of the upper jaw, although slender, placed so close together as to form a cutting edge. The species are not numerous. One only (*C. vulgaris*) is a native of the British seas. It is common on all parts of the coast, and is found both among rocks and on banks. Its form much resembles

Conger-Eel.

that of a fresh-water eel; its color is brown above, passing into dull white beneath; the fins whitish, edged with black; and the lateral line almost white. It attains a large size, often five or six feet long; sometimes ten feet, and eighteen inches in circumference, weighing more than one hundred pounds. It possesses great strength, and is a formidable antagonist when hauled into a boat by the fisherman's line, or found among the rocks, where it is sometimes left by the retiring tide. Great numbers are, however, taken in order to be used as food, although not highly esteemed, and chiefly consumed by the poorer classes. The principal C. fishery of Britain is on the Cornish Coast, and it is not uncommon for a boat with three men to bring on shore from a ton to two tons as the produce of a night's fishing, the C. being caught most readily during the night; but there are banks off the French coast still more productive. Sand-launces, pilchards, &c., are used for bait. The C. is extremely voracious.

CONGE'STION may be defined to be 'excess of blood in the vessels of a part, with diminished motion of that blood.' The chief causes of congestion may be classed under the two heads of (1) congestion from venous obstruction, and (2) congestion from want of tone in the vessels.

1. *Congestion from venous obstruction* is easily illustrated by tying up the arm, as is done before opening a vein, when the veins are compressed more than the arteries. If the ligature is kept on for a sufficient time, the veins swell, the fingers become red, and then livid, and the whole limb is swollen. Cold applied to the surface of the body acts similarly on it, and contracts the veins more rapidly than the arteries, which lie deeper; and the purple color of the hands and face after exposure to cold shows the congested state of the capillaries. 'Congestions,' says Dr. C. J. B. Williams, 'are caused in external organs by an obstruction of the veins leading from them. Thus, congestion of the brain may be produced by a tight cravat or by a tumor pressing on the jugular veins, efforts of straining, coughing, holding the breath, and asthmatic paroxysms which impede the flow of blood through the lungs cause congestion in various parts. Tubercles in the lungs cause congestion of that organ. Obstruction to the transit of blood through the liver causes congestion in the abdomen, hemorrhoids, &c.'—*Principles of Medicine*, 2d ed., p. 180.

2. *Congestion from want of tone in the vessels* includes a numerous class of cases. In atony of the vessels generally, as in extreme debility, certain fevers, &c., there is general congestion of the parenchymatous organs—the lungs, liver, &c.—and the blood gravitates to the lowest parts, giving rise to what is termed *hypostatic* congestion of the posterior parts of the lungs, the skin of the back, &c. In other cases, the weakness is local, as when the feet swell after long standing, in consequence of over-distension of

the veins. Similarly, a continued stooping posture may occasion headache, giddiness, and the other symptoms of congestion of the brain. Congestive affections of this kind are often mistaken for inflammation, and instead of being treated by tonics, are treated by depletion, which, although affording temporary relief, increases the evil.

Another cause of congestion is over-excitement of the vessels, and this often occurs at an early stage of inflammation, or as a result of that process.

We must pass over the symptoms and effects of congestion, because they vary very much according to the organ affected, and shall conclude with a few words on the general remedies for congestion. First in order, we must notice such as remove the cause, as the loosening of a ligature, or the removal of a tumor compressing veins, elevation of the head in affected brain, and the recumbent position in congestion of the hæmorrhoidal or uterine vessels.

Pressure, by supporting the weak vessels, and friction, by increasing the onward movement of the blood in the veins, are often of great use. Astringents, such as solutions of alums, sulphate of zinc, tannin, oak-bark, &c., may be applied with advantage locally to certain parts, as the eye, throat, rectum, &c.; and stimulants may be similarly used, as a capsicum gargle to a relaxed sore throat. Medicines of these classes may also be given internally. Thus, the principal action of bark, quinine, and arsenic in the cure of ague is supposed to lie in their reducing the great visceral congestion that is always present. A glass of strong hot brandy and water will often remove a congestive headache, and a stimulant draught will often relieve the pulmonary congestion which follows a fit of asthma. Various remedies are supposed to have a special power of removing the congestion of certain organs; thus mercurials are recommended for congestion of the liver; digitalis and cantharides for congestion of the kidneys; and squills, benzoin, and the balsams for bronchial congestion.—For further details, the reader is referred to the excellent work of Dr. Williams, from which we have quoted.

CO'NGLETON, a market-town in Cheshire, picturesquely situated in a deep valley, on the Dane, 33 m. E. of Chester. It is a mile long, with many houses built of wood and plaster, and has silk spinning and throwing, with manufactures of silk ribbons, &c. There are coal-mines near. Pop. (1871) 11,344.

CONGL'OMERATE, or PLUMPU'DDING-STONE, a rock consisting of round, water-worn pebbles, compacted together into stone. These pebbles consist of portions of hard rock, frequently of quartz. They can sometimes be traced to their parent rock. Their rubbing and polishing must have been a work of considerable time, but their deposition in the beds in which they occur has been performed speedily, the materials having been brought together by a strong current. They are united together by a silicious, calcareous, or ferruginous cement, sometimes so loosely, that they are easily separated by a slight blow from a hammer; at other times, the matrix is as hard as the pebbles which it contains, and clasps them so firmly, that the rock breaks, as if it were a homogeneous mass. The pebbles vary in size, occasionally being several feet in diameter; but they are generally about the size of, or smaller than a walnut.

CO'NGO, in the widest sense of the name, includes all the countries on the west coast of Africa lying between the equator and lat. 18° S.; but more definitely the name is given to the territory lying between the rivers Dando and Congo, or Zaire.—The great central African river, the Congo, which Stanley has proposed to call the *Livingstone*, has of late usurped much of the interest formerly reserved for the Nile and its exploration. At its mouth on the Atlantic seaboard the Congo is an immense body of water, near ten miles wide and over 160 fathoms in depth. Its upper course remained unknown till Mr. Stanley identified the Congo with the Lualaba, and so connected it immediately with the great system of lakes south and west of Lake Tanganyika, and less directly with Tanganyika (q. v.) itself.

The former chain of lakes, examined by Livingstone in the hope that here he might finally fix the sources of the Nile, were long suspected to drain towards the Congo—a suspicion confirmed by Cameron. But Mr. Stanley and his followers, striking the Lualaba (known higher up as Chambezi and Luapula) at Nyangwe in Nov. 1876, followed its course persistently in the face of enormous difficulties, fighting no less than thirty-two battles; till in August 1877 he found it, after 'changing its name scores of times,' reach the Atlantic as Congo, Kwango, and Zaire. The Lualaba-Congo, interrupted to the north of Nyangwe by cataracts and rapids, flows northward from the lake region to about 2° N. of the equator (where it is already 'a broad stream, from two to ten miles wide, studded with islands'); then its course changes to N.W., W., and finally to S.W. 'As the river runs through the great basin which lies between E. long. 26° and E. long. 17°, it has an uninterrupted course of 1400 miles, with magnificent affluents, especially on the southern side. Thence, cleaving the broad belt of mountains between the great basin and the Atlantic Ocean, it descends by about thirty falls and furious rapids to the great river between the falls of Yellala and the Atlantic.'—By means of its great and numerous tributaries (such as the Alima, Kwango, Kasai, Ruru), it is supposd to drain an area of 860,000 square miles. Off Vivi, 115 miles from its mouth, vessels of 5000 tons can anchor; at its mouth the river is 6 miles wide, and in mid-channel is 150 fathoms deep. There is a good deal of trade on the Congo, and numerous European trading-stations exist. The gross exports and imports are said to be worth £2,000,000, the imports of English manufactures being stated at £600,000. After 1878 Mr. Stanley, as representative of the International African Association, under the presidency of the king of the Belgians, proceeded to open up the Congo to commerce and civilization; and by 1883 had established seven stations on the river, one being 700 miles above the mouth. He had made a road 100 miles long, past the 66 cataracts at Yellala Falls; and launched four steamers on the Upper Congo. From the great lake-like expanse of Stanley Pool (in 15° 47′ W. long.), these vessels can steam 800 miles up into the heart of Africa. In 1882, M. de Brazza persuaded certain native chiefs on the Congo about Stanley Pool to cede their territory to France; and the French government sanctioning this proceeding, sent out a military expedition in 1883 to support the scheme. M. de Brazza proposed making a road from Ponte Negra, a long way above the mouth of the river, to Brazzaville near Stanley Pool.

Portugal has long claimed sovereignty on both sides of the mouth of the Congo, and has of late insisted on its claim. The complication of interests thus brought about provoked a good deal of diplomatic correspondence. The territory recognizedly Portuguese on the west coast of Africa extends from Cape Frio to Ambriz northwards, and contains the provinces of Mossamedes, Benguela, and Angola. The Portuguese claim to sovereignty along the coast from Ambriz to Kakongo (in 5° 12′ S.), north of the Congo, has been much disputed between Portugal and Britain since 1845; in 1883, Britain was disposed to make some concession.—When the whole country from the Congo River to Loanda was subject to the king of Congo, the Jesuits worked far and wide from their base in his capital, San Salvador, where they had a cathedral and monasteries.

CONGOO'N, or KONGUN, a town of Persia, on the Persian Gulf, 130 miles south of Shiraz. It has an excellent and safe roadstead; and both wood and water, which are generally scarce in the gulf, may be obtained here. Pop. 6000.

CONGREGA'TION (Lat. *con*, together; *grex*, a flock), an assembly, generally a religious assembly; in its most ordinary use, an assembly of Christians met in one place for worship. See CHURCH.—In the Roman Catholic Church, it often designates a sort of board of cardinals, prelates, and divines, to which is intrusted the management of some important branch of the affairs of the church. Thus the *C. of the index* examines books and decides on their fitness for general perusal. See INDEX. The *C. de Propaganda Fide* consults as to the advancement of the Roman Catholic religion throughout the world. See PROPAGANDA. The *C. of Relics* inquires into the genuineness of supposed relics. The *C. of the Holy Office* takes cognizance of heresies, &c. See INQUISITION. The *C. of rites* regulates the festivals and offices of new saints. There are numerous other congregations.

CONGREGA'TIONALISTS. See INDEPENDENTS.

CO'NGRESS, an assembly either of sovereign princes, or of the delegated representatives of sovereign states, for the purpose of considering matters of international interest. Even in America, though the term has now a different meaning (See UNITED STATES), it had a similar origin, the first C. being that of the delegates from the various British colonies, who met on the 7th October 1765, for the purpose of considering their grievances. Previous to signing a treaty of peace, a meeting of plenipotentiaries usually takes place, to which the name of a C. is sometimes applied, though it seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined on, and the balance of power amongst the various European states readjusted.

To this class belonged the famous C. of Vienna in 1815; the C. of Carlsbad in 1819, for regulating the affairs of Germany; the Paris C. at the termination of the Russian war of 1854–56; the memorable C. at Berlin after the Russo-Turkish war of 1877–78; and many others. There is scarcely any difference between a C. and a diplomatic conference.

CONGREVE, WILLIAM, the second son of Richard Congreve, Esq., of Congreve and Stretton, was born about 1672, at Bardsey, Yorkshire. Educated at Kilkenny, and at Trinity College, Dublin, he in 1688 returned to England, and was entered at the Middle Temple, but he does not seem to have taken kindly to law. His first publication was a novel, entitled *Incognita, or Love and Duty Reconciled*, a performance which Dr. Johnson said he would rather praise than read, but which has been neither read nor

praised by succeeding critics. His first play, *The Old Bachelor*, was produced at Drury Lane when C. was in his 19th year, and its success was remarkable. Next year he came out with *The Double Dealer*, which was a comparative failure; but his comedy *Love for Love*, published in 1695, was a great success, and brought to its author money and fame. *The Mourning Bride*, a blank-verse tragedy, written after the manner of the old passionate masters, came out in 1697. Its success was enormous, far exceeding that of his comedies, but it has long since fallen from its high estate. Two years after, he produced his comedy, entitled *The Way of the World*, which failed completely, and disgusted him with the theater; although, according to some critics (as Swinburne), it is not merely the crowning work of C.'s genius, but 'the unequalled and unapproached masterpiece of English comedy,' equal or nearly equal to Molière's best. In other respects C. was a fortunate man. He held various offices, which together yielded him an income of £1200. C. affected to despise his theatrical triumphs, and cultivated the modish airs of a fine gentleman, an eccentricity which laid him open to rebuke when he was visited by Voltaire. In his later days, he was afflicted by gout and blindness. He died in London on the 19th of January 1729, and was buried in Westminster Abbey, nobles supporting the pall.

As a writer of comedies, C. takes a high place; he has been called 'the greatest English master of pure comedy.' His plays abound in brilliantly witty dialogue and lively incident, and the style is fine and clear-cut. But his plots are intricate; his dialogue is defiled by all the grossness of his age; and he has but few of those touches of nature that make the whole world kin.

CONGREVE ROCKET. See ROCKET.

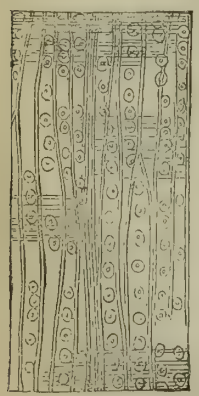
CO'NGRUOUS. In Geometry, the term congruity is applied to lines and figures which exactly correspond when laid over one another. See COINCIDENCE.

In Arithmetic, two numbers are said to be C., with respect to a third, when their difference is exactly divisible by it. Thus, 12 and 7 are C. with respect to 5, as $\frac{12-7}{5}=1$, and so are 27 and 12, as $\frac{27-12}{5}=3$. The numbers considered must be whole numbers. When two numbers are C. to a third, either is called a *residual* of the other with respect to the third.

CO'NI, or CUNE'O, capital of an Italian province, stands in a fruitful district, 48 miles southwest of Turin. Pop. (1881) 12,413. Its chief manufactures are silk and woollen cloth.

CO'NIC SECTIONS. See CONE, CIRCLE, ELLIPSE, PARABOLA, and HYPERBOLA.

CONI'FERÆ (Lat. cone-bearers), an important natural order of exogenous plants, containing the pines, firs, juniper, yew, &c.; agreeing with the other exogenous orders generally in the structure of the stem and in the mode of vegetation, but differing remarkably from most of them in having naked ovules—i. e., ovules which are not enclosed in an ovary, but are fertilized by the direct application of the pollen to the *foramen*, without the intervention of style or stigma—and upon this account separated from them, along with *Cycadaceæ* (q. v.), by Lindley, Endlicher, and others, as a distinct class, under the name *Gymnogens* or *Gymnospermæ*. The flowers are unisexual, the male and female sometimes on the same, sometimes on separate plants; the male flowers have either one stamen or one bundle of stamens, the anthers often crested; the female flowers are in cones or solitary; the place of ovaries is supplied by the flat scales of the cones, the ovules are usually in pairs on the face of the scales, either inverted or erect. The fruit is either a cone—the scales of which sometimes become fleshy, and are incorporated into a berry-like fruit—or a solitary naked seed. The seed has a hard crustaceous integument; the embryo is in the midst of fleshy oily albumen; the cotyledons are either two, or numerous and whorled. The mode of branching is peculiar, numerous buds proceeding from the side of the main stem, so as generally to form whorls of branches, which are generally almost horizontal in their direction, whilst the central vertical shoot runs up often with admirable straightness, and some of the C. attain a height unrivalled among other forest-trees, of which the *Wellingtonia* (q. v.) of California affords the most noble example. The wood consists of *punctated* cells; the sides of the tubes or elongated cells which form it, and which are nearly of equal diameter, being marked by circular discs, which, when highly magnified, exhibit a small internal circle surrounded by a larger external one. The annexed cut represents a longitudinal section of part of the stem of a fir, highly magnified, showing the discs. This peculiarity of the wood of the C. is important, as enabling us to recognize it in a fossil state, and to refer many fossils, particularly of the coal formation, to this order. The leaves of the C. differ very widely from those of the closely allied order *Cycadaceæ*.



Most of the C. have very narrow veinless leaves, so that the Germans call them *Needle-woods* (Nadelhölzer) in contradistinction to the other European forest-trees, which they call *Leaf-woods* (Laubhölzer). By far the greater number of them belong to the northern hemisphere. The C. are very long lived; some of them are supposed to be capable of attaining an age of 2000 or 3000 years. When the stem of a coniferous-tree is cut across, it does not sprout again from the root. The C., besides the great usefulness of the timber of many, are remarkably productive of Turpentines (q. v.) and Resins (q. v.). Astringent substances are also found in their bark, and fixed oil in their seeds. The seeds of some species of *Pine* and *Araucaria* are used as food.

The C. are divided into—1. *Abietineæ*, having inverted ovules and woody cones, as the pines, firs, larch, cedar, araucaria, &c. 2. *Cupressineæ*, with erect ovules, and either woody or fleshy cones, as the juniper, arbor-vitæ, cypress, &c. 3. *Taxineæ*, with solitary seeds, as the yew, gingko, &c. 4. *Gnetaceæ*, plants of comparatively humble growth, with jointed stems, often regarded as forming a distinct order. See SEA-GRAPE. Lindley and others also make the *Taxineæ* a distinct order. See YEW.

CONIRO'STRES, a tribe or section of the order of birds called *Insessores*, and characterized by a strong conical bill, without notches. The feet are, in general, adapted for walking on the ground, as well as for perching. The bill varies much in its thickness, and those species in which it is thickest, in general feed most exclusively on seeds. The number of birds belonging to this tribe is very great; and the families differ much in many respects. Among them are finches, sparrows, buntings, linnets, larks, plantain-eaters, colies, crows, birds-of-paradise, starlings, and even hornbills.

CO'NIUM. See HEMLOCK.

CO'NJUGAL RIGHTS. See MARRIAGE.

CONJUGA'TION (Lat. a connecting or yoking together), a term in Grammar applied to a connected view or statement of the changes of form that a verb (q. v.) undergoes in its various relations. See INFLECTION. The forms usually included under this term are those that serve to mark: 1. *Person*, or the distinction between the speaker, the spoken-to, and the spoken-about; as (I) *write*, (thou) *writest*, (he) *writes*. 2. *Number;* as (John) *writes*, (they) *write*. 3. *Tense*, or time; as (I) *write*, *wrote*, *have written*, *will write*. 4. *Mood*, or the manner in which the action is presented. When the action is simply asserted, it is the Indicative mood, as (he) *wrote;* when put as a supposition or condition, it is the Conditional mood, as, *if he wrote*. The Potential mood expresses the power of doing the action, as *he can write;* and the Imperative commands the doing of it—*write*. The Infinitive mood expresses the action without limitation of any kind—*to write;* as it makes no affirmation, it is, strictly speaking, not a verb, but a kind of abstract noun.

The two participles, the one expressing the action as in progress (*writing*), the other as completed (*written*), may be classed with the infinitive, as not affirming anything. In opposition to the infinitive and the participles, the other parts of the verb are called Finite. 5. *Voice*, or the distinction between Active and Passive (see VERB); as (he) *wrote* (the letter), (the letter) *was written* (by him).

In English, and in most modern European languages, the greater part of those distinctions are indicated by separate words; in Sanscrit, Greek, and Latin, they were nearly all indicated by prefixes and affixes, or other modifications of the word itself. The nature and origin of these modifications are considered under the head INFLECTION. All verbs do not take the same changes even in the same language. Although the affixes, e. g., may have originally been the same, yet they underwent, in course of time, different kinds of corruption or obliteration, depending upon the nature of the letters in the root verb. This leads to the verbs of a language being arranged in different classes or conjugations. In Latin, for instance, grammarians recognize four conjugations, and verbs that cannot be brought into any class are called Irregular Verbs.

In English, there are two distinct types of the inflection of verbs; thus, *I love*, becomes in the past tense, *I loved*, and in the passive voice, *I am loved;* while *he shakes* becomes *he shook*, and *he was shaken*. Verbs that, like *love*, take *d* (or *ed*—sometimes *t*) in their past tense and past participle, form one class or C.; and those resembling *shake* in their changes form another. The former class is by far the most numerous; but the latter includes the most commonly used and oldest verbs in the language. The mode of change seen in *shake*, *shook*, *shaken*, is believed to be more ancient than the other, and is therefore called the Old C.; and sometimes, the Strong C., the other being the New or Weak. The verbs belong-

ing to the old C. are all of Saxon origin, and are primitive or root verbs; while derivative verbs belong to the other class. Verbs of the weak C. are pretty uniform in taking *d* or *ed*, although after certain letters the *d* is of necessity pronounced as *t*, and is sometimes replaced by that letter in writing—*dipt*. With regard to verbs of the strong C., no rule can be given as to the change of vowel by which the past tense is formed. It was made at first, no doubt, according to felt laws of euphony; and even yet a certain 'method' may be discerned 'in their madness.' Thus:

1. Rise, rose; smite, smote; ride, rode; drive, drove, &c.
2. Cleave, clove; steal, stole; speak, spoke; tear, tore, &c.
3. Swim, swam or swum; sing, sang or sung; ring, rang or rung, &c.

For further information on the C. of English verbs, see Latham's *English Language*, or Chambers's *Information for the People* (ed. 1874), vol. ii., art. 'English Grammar.'

CONJUGATION OF CELLS, a union of two distinct cells of a plant, in order to reproduction. It has been observed only in the *Confervaceæ* and *Diatomaceæ*. Two cells come into contact, as by two filaments of a *Conferva* being brought together, and little projections are formed from each, the points of which are absorbed, and thus a tube is formed, through which one of the cells empties itself into the other. The latter then becomes a *mother-cell*, and produces spores.

CO'NJUNCT AND CO'NFIDENT. See INSOLVENCY.

CONJU'NCTION, in Astronomy, is one of the Aspects (q. v.) of the planets. Two heavenly bodies are in C. when they have the same longitude—that is, when the same perpendicular to the ecliptic passes through both. If they have, at the same time, the the same latitude—that is, if they are both equally far north or south of the ecliptic—they appear from the earth to be in the same spot of the heavens, and to cover one another. The sun and moon are in C. at the period of new moon. In the case of the inferior planets, Mercury and Venus, there is an inferior C. when the planet is between the earth and the sun, and a superior, when the sun is between the earth and the planet. In general, a heavenly body is in C. with the sun, when it is on the same side of the earth and in a line with him; and it is in *opposition* to the sun, when it is on the opposite side of the earth, the earth being in a line between it and the sun. Planets are invisible when in C. with the sun, except in rare cases when an inferior planet passes over the sun's disk, and may be seen as a speck on his surface. Conjunctions are either *geocentric* or *heliocentric*, according as they are actually witnessed from the earth, or as they would be witnessed if observed from the sun. In observing a C. from the earth's surface, it is usual to reduce the observation to what it would be if made from the earth's center; by this means, the exact times of C. are more accurately fixed, and the observations of one astronomer made available to every other, wherever he may be on the earth's surface. *Grand conjunctions* are those where several stars or planets are found together. The Chinese history records one in the reign of the Emperor Tehuen-hiu (2514—2436 B.C.), which astronomers calculate to have actually taken place.

CONJUNCTIONS, one of the 'parts of speech,' or classes, into which grammarians divide words. C. serve the purpose of connecting sentences, parts of sentences, and single words; as, 'Day ends, *and* night begins. William *and* John learn Latin. Charles *and* James carried the basket between them.' In the first sentence, *and* connects two separate affirmations into one compound sentence.

The same is true in the second—the separate affirmations being 'William learns Latin,' and 'John learns Latin.' In the third sentence, *and* connects only the two words, 'Charles' and 'James,' as it cannot be affirmed of either of them alone that he 'carried the basket.' In most cases, however, it can be shown that, logically at least, two affirmations are involved, and that the conjunction really connects the affirmations. It is not easy to distinguish C. from adverbs. In fact, C. were all originally other parts of speech; and the greater part of them are still really adverbs, and owe their conjunctive effect to their signification as adverbs. In *and* and *but*, whatever may have been the original meaning, we now attend only to the conjunctive effect; *or* is a shortened form of the pronominal adjective *other;* and *nor* is *or* with the negative prefixed. In such a sentence as, 'I believe that you are wrong,' *that* is the demonstrative pronoun, equivalent to—I believe *this*, viz., 'you are wrong.' This is clearly seen in the corresponding words in other languages: Ger. *dass*, Fr. *que*, Lat. *quod* (for the relatives were originally demonstrative pronouns). All the rest might be called Adverbial C. or Conjunctive Adverbs. Ex., 'He is industrious; *therefore* he is happy'—That is, 'he is happy *for that*.' This adverb, or adverbial phrase, expressive of the cause of the happiness, by referring us back for its meaning to the former assertion, has the effect of connecting the two assertions in the mind. Again, 'The messenger arrived *while* he was speaking.' Here *while* is equivalent to, *at the time at which* (he was speaking). As an adverbial phrase, this simply indicates the time of the act of 'arriving;' but as it also expresses that the speaking was going on at the same time, it thus conjoins the two assertions.

The most important distinction among C. will be seen in the following pair of sentences:

The sun went down, *and* the moon rose.
The moon rose, *as* the sun went down.

The first (compound) sentence contains two simple sentences or assertions, linked together, yet each standing on an independent footing; the two are joined on terms of equality, and are therefore said to be *co-ordinate*, and the conjunction is called a Co-ordinating Conjunction. In the second sentence, the last clause, though a grammatical sentence, contains no logical proposition, no assertion made for its own sake, but merely states a fact as a modifying circumstance with regard to the assertion contained in the first clause. The sentence of the second clause is therefore *subordinate* to that of the first, and the conjunction that marks the relation, a Subordinating Conjunction. The chief Co-ordinating C. are:

1. *And, also, likewise, not only—but, partly—partly, first—then, further.* All these are used to tack on sentences whose sense accords with, or adds to, the effect of what goes before. Hence they might be called *cumulative* conjunctions. The following (2) mark various degrees of opposition in the sense or effect of the sentences, and might be called *adversative* conjunctions. These terms seem preferable to *conjunctive* and *disjunctive*, generally used.

2. (*a.*) *Not—but, else, otherwise* (Exclusive).
   (*b.*) *Either—or, neither—nor* (Alternative).
   (*c.*) *But, only, yet, still, at the same time, nevertheless.*

3. *Therefore, wherefore, for, thus, consequently, hence, accordingly, so, so that.* (Cause and effect.)

All other C. may be classed as Subordinating, such being their usual function. Those in most common use are: *Although, as, as well as, so—as, as—as, because, if, lest, since, than, that, in order that, though, unless, whether, when, before, after, while.*

CONJU'NCTLY AND SE'VERALLY, in the law of Scotland, corresponds to jointly and severally in England, and denotes a form of obligation by which each of several obligants becomes bound for the whole. The creditor in such circumstances has his option either to exact the obligation proportionately from each of the co-obligants, or to select one of them, and exact the whole from him, leaving him to seek his relief against the others.

CONJURING. See MAGIC INCANTATION.

CONN, LOUGH, a lake in the north of Mayo county, Ireland, and with Lough Cullin (from which it is separated by a narrow neck of land), 13 miles long, and 1 to 3 broad. It lies in a wild romantic region of hills, glens, rocky slopes, precipices, broken ground, and bogs. It contains isles, has bold shores, and is 40 feet above the sea.

CONNARA'CEÆ, a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, sometimes climbing, with compound alternate leaves, destitute of stipules; the flowers in racemes or panicles. Resinous juices do not occur in this order. Forty or fifty species are known, all tropical. The best known product of this order is the beautiful wood called ZEBRA WOOD, the wood of a large tree which grows in Guiana, *Omphalobium Lamberti*. The fruit of some species of *Omphalobium* is eaten; the eatable part is the fleshy aril.

CO'NNAUGHT, the westmost and smallest of the four provinces of Ireland. It is bounded N. and W. by the Atlantic; E. by Ulster and Leinster, from the latter of which it is separated by the Shannon; and S. by Munster. It contains the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Greatest length from N. to S., 105 miles; greatest breadth, not including Achil Island, 92 miles. Area, 6863 square miles. Along the west coast are many fine bays and harbors. The country, especially in the west, is mountainous and rugged, remarkably grand and picturesque. (For detailed information, see the respective counties.)

The people are still almost purely Celtic. In the times of the Irish pentarchy, the O'Connors were kings of Connaught. In 1590, the province was divided into six counties, the five above mentioned with Clare (which was afterwards joined to Munster). It then lost its independence, and came under English administration. From famine and emigration, the population of C. have been diminished by more than 600,000 since 1841. It was, in 1841, 1,420,705; in 1851, 1,012,479; in 1861, 919,135; in 1871, only 846,213; in 1881, 817,197.

CONNE'CTICUT, the largest river to the east of the Hudson in the United States, rises on the south border of Lower Canada, near Lat. 45° N., and after a fall of 1600 feet and a south-south-west course of at least 400 miles, enters Long Island Sound, in lat. 41° 16′ N. With the exception of the state of Maine, it may be said to be the chief artery of the whole of New England, separating New Hampshire on the east from Vermont on the west,

and afterwards crossing successively Massachusetts and the state of its own name. It is navigable up to Hartford, a distance of 50 miles, for a draught of eight feet; and up to Middletown, which is 16 miles nearer the sea, for a draught of ten feet; while, with a few subsidiary canals, it carries barges of eight or ten tons fully 200 miles above the former city. The C. has many alluvial intervals on its banks, which, being generally inundated in the spring, are remarkable for their fertility. The stream is famous both for the quantity and the quality of its shad; and its valley, about forty miles wide, presents a considerable variety of romantic scenery.

CONNECTICUT, the most south-westerly state of New England in the United States, and one of the original members of the great confederacy, is situated in lat. 41°—42° 3′ N., and long. 71° 55′—73° 50′ W. Area, 4750 square miles. Pop. (1880) 622,683; between 1790 and 1870, it had increased from 238,141 to 537,454—being an advance of barely 1⅛ per cent. per annum. A result so anomalous, where the general population doubles itself in a quarter of a century, is creditably explained by the fact, that to all the new states of the Union C. has uniformly been a nursery of educated men of every class—of merchants and agriculturists, of lawyers and statesmen. The state sends two senators to the upper house of Congress, and four representatives to the lower house. Under the existing constitution, which superseded the charter of Charles II. only in 1818, the local authorities are a governor, a lieutenant-governor, a senate of 18 to 24 members, an assembly of 237 representatives, and a supreme court. In 1850 the value of property was 120,000,000 dollars; in 1878, 344,400,000 dollars. In the latter year the public income was 1,653,570 dollars; and the expenditure, 1,542,612 dollars.

Respectively to the west and east of Connecticut River are the Housatonic and the Thames, of which the former is navigable 12 miles upwards, and the latter 14. Many smaller streams afford valuable water-power. Besides the New Haven and Farmington Canal, 16 miles in length, C. is traversed in almost every direction by railways. The chief towns are Hartford, New Haven, Bridgeport, New London, and Norwich—the second and fourth being the principal ports, and all of them being accessible from the sea. The colleges are three in number; and the schools of every grade may stand a comparison with any in the Union. The soil is better fitted for pasturage than for tillage. The minerals are iron, plumbago, marble, and freestone. The staple productions are butter, cheese, wool, maize, oats, barley, wheat, flax, hemp, tobacco, and cider. In 1880, there were 4488 manufactories in C. employing 113,000 hands (annual produce worth $185,680,000); the cotton manufactories alone employed 15,500 persons (only three states employ more).

CONNOISSEUR (Fr.), the French term by which we commonly designate persons who, without being themselves artists, are supposed to possess a discriminating knowledge of the merits of works of art. They are called by the Italians Cognoscenti. See DILETTANTI.

CO′NOID, a solid formed by the revolution of a conic section round its axis; such are the sphere, paroboloid, ellipsoid, and hyperboloid.

CO′NQUEST. In the law of succession in Scotland, heritable property acquired during the lifetime of the deceased, by purchase, donation, or excambion, is called C., in opposition to that to which he has succeeded, which is called Heritage. In the event of one dying intestate leaving only brothers, but brothers both older and younger than himself, or of his leaving uncles both older and younger than his father, or the issue of such brothers or uncles, these two kinds of property took different lines of succession, the heritage descending to the younger brothers or uncles, the C. ascending to the elder brothers or uncles. This was abolished in 1874. C., in a marriage-contract, merely means the difference between the possessions of the husband before and after marriage, allowance being made for the increased expenditure; or that by which he has been made richer (locupletior). Such property is frequently settled either on the heir or on the issue of the marriage.

CO′NRAD. See KONRAD.

CONSA′LVI, ERCOLE, CARDINAL, a distinguished reformer of abuses in the Papal States, was born at Rome, June 8, 1757. He was made cardinal and secretary of state by Pope Pius VII., and in this capacity concluded the concordat with Napoleon in 1801. His stanch maintenance of the rights of his own sovereign against the insidious encroachments of France offended Napoleon, who in 1806 demanded his removal from office; and the pope at last unwillingly consented, on the desire of C. himself, who was anxious that peace should continue. He was, however, again employed in 1815 in all the transactions between Rome and Paris, and also in settling the internal affairs of the Papal States. In the latter capacity, he reformed numerous abuses; and the measure known as the *Motu Proprio*, introduced by him in 1816, suppressed all monopolies, feudal taxes, and exclusive rights. He was a liberal patron of science, but especially of the fine arts, and employed his leisure in the study of literature and music. In diplomacy, he displayed great address, and was generally successful. He died in Rome, January 24, 1824.

CONSANGUI′NITY (Lat. *con*, together, and *sanguis*, blood), the relationship which subsists between persons who are of the same blood. It is either *direct*—which is the relationship between ascendants and descendants—or *collateral*, between persons sprung from a common ancestor. In the direct line, a son is said to stand in the first degree to his father; a grandson, in the second degree to his grandfather; and so on. In the collateral or oblique line, two different modes of numbering the degrees of consanguinity have been in use, the one that of the civil, the other of the canon law. By the civil law, the degrees are separately numbered downwards to each party from the common ancestor, the common ancestor not being counted. Thus, brothers are in the second degree of consanguinity; uncle and nephew in the third; cousins-german in the fourth; and second cousins, or the children of cousins-german, in the sixth degree. By the canon law, consanguinity in the equal oblique line, i. e., where the parties are equally removed from the common ancestor, is computed by the number of degrees between one of them only and the common ancestor; brothers being said to stand in the first, and cousins-german in the second, degree to each other. In the unequal oblique line, i. e., which the parties stand in different degrees of relationship to the common ancestor, the degree is determined by the number of steps between the common ancestor and the party further removed from him: thus, uncle and nephew are computed as in the second degree to each other, because the nephew, the further removed of the two, stands in the second degree to the common ancestor, his grandfather. The canon law computation is more generally used by English lawyers, though statute 22 and 23 Car. I. c. 10 adopts that of the civil law. Scotch lawyers, since the Reformation, have generally used the civil law mode of computation.

Affinity is the relationship brought about by marriage between a husband and the blood-relations of his wife, or between a wife and the blood-relations of her husband. The relations of one spouse in any particular degree of consanguinity stand in the same degree of affinity to the other spouse. There is no relationship by affinity between the blood-relations of the husband and those of the wife.

Consanguinity and affinity have been at different times and in different parts of the world more or less looked on as impediments to marriage between the parties related. Among the ancient Persians and Egyptians, marriages are said to have been sometimes sanctioned between brother and sister, and even father and daughter. The Athenians, while permitting marriages between brothers and sisters uterine, prohibited them between the same relations by the father's side or the full blood. In the book of Genesis, we read of Abraham marrying his half-sister. The Levitical law prohibited marriage between relations in the direct line, between brother and sister, nephew and aunt, and apparently by implication, uncle and niece. A son was prohibited from marrying his father's wife.

The Roman law prohibited marriage between ascendants and descendants, a prohibition extended to relations by adoption, and even after the dissolution of that tie. In the collateral line, the prohibited degrees included brother and sister (extending to persons so related by adoption where the tie continued to exist), and all cases where one party stood *in loco parentis* to the other, as uncle and niece. Marriage between cousins-german, at one time prohibited, was declared lawful by Arcadius and Honorius. The degrees prohibited in consanguinity were by Constantine also prohibited in affinity.

By the old canon law and early decretals, marriages were prohibited between persons as far removed as the seventh degree of consanguinity or affinity—i. e., between persons who might, by the civil law computation, be within the twelfth degree to one another. The fourth council of Lateran, 1215 A.D., narrowed the prohibition from the seventh to the fourth degree; i. e., the grandchildren of cousins-german. Affinity was held to be constituted not merely by marriage, but by the spiritual relationship of standing sponsor at baptism, and by illicit intercourse; marriage being prohibited between persons one of whom had had carnal connection with a relation in the fourth degree of the other.

A marriage between persons related in any of these ways was accounted incestuous, and the children bastards. The pope assumed the right of granting dispensations from impediments to marriage arising from consanguinity and affinity, a power which seems to have been first exercised in the 12th century. In no instances have dispensations been granted to relations in the direct line, but one or two dispensations are said to have been granted between brother and sister; and between uncle and niece, they are still occasionally granted in countries where the canon law continues to be binding. Between remoter relations, they have

been common. The extent to which these prohibitions were carried, and the possibility of their being dispensed with, naturally tended to encourage profligacy and lax ideas of the marriage tie, it being hardly possible to say of any marriage that it might not one day be proved invalid. The Council of Trent restricted the impediment of affinity from illicit intercourse to the second degree.

In the countries which embraced the Reformation, a general relaxation took place in the prohibitions to marriage from consanguinity and affinity. In England, 32 Hen. VIII. c. 38 allowed all persons to marry who were not prohibited by the Levitical law; and according to the interpretation put on this statute, the prohibitions included all relations in the direct line, brother and sister, and collaterals, when one party is brother or sister to the direct ascendant or descendant of the other; the degrees prohibited in consanguinity being equally prohibited in affinity. The prohibitions from consanguinity have been held to extend to bastard relations. But down to 1835, marriages within the prohibited degrees were valid and the issue legitimate, unless the marriage had been annulled by a declaratory sentence of the Ecclesiastical Court, which could only be obtained while both spouses were alive. By act 5 and 6 Will. IV. c. 54, all marriages within the prohibited degrees of consanguinity and affinity were made absolutely void.

In Scotland, for a very short time after the Reformation, the papal power of dispensation was exercised by the crown. Acts 1567, c. 14, and 1567, c. 15, professing to take the Levitical law as the standard, assimilated the prohibitions from consanguinity and affinity to those of England. Incest, or sexual intercourse with persons within the prohibited degrees, was, by the former statute, made a capital crime. As to marriages between bastard relations, the law of Scotland is in a doubtful state; but there is no prohibition against marriage with a relation however near of a person with whom one has had sexual intercourse.

In France, the Code Napoléon prohibits marriage between ascendants and descendants lawful or natural, and persons similarly connected by affinity; and in the collateral line between brothers and sisters lawful or natural, and persons similarly connected by affinity. Marriage between uncle and niece and aunt and nephew, is also prohibited. In Spain and Portugal, the canon-law restrictions are in full force, with the corresponding system of permissive dispensations. In various countries of Europe, as Denmark, no prohibitions from affinity, except in the direct line, are recognized. In most of the United States of America, marriage is allowed between uncle and niece.

CO'NSCIENCE. See ETHICS.

CONSCIENCE, COURTS OF, IN ENGLAND. These were courts for the recovery of small debts, constituted by special local acts of parliament in London, Westminster, and other trading districts. These courts were also called *Courts of Requests*. On the establishment of county courts, the courts of C. with a few exceptions, were abolished. See COUNTY COURTS.

CONSCIENCE, HENDRICK, the most fertile and original writer of fiction in Belgium, was born December 3, 1812, at Antwerp, where his father was inspector of the dockyards, until he became a dealer in waste-paper, old books, &c. C. educated himself by the aid of his father's miscellaneous store of books until his 15th year, when he entered a school, where he was engaged to assist the master in teaching. On the breaking out of the revolution in 1830, C. joined the ranks under General Niellon, and served till 1834, when he left the service, being disgusted with the stricter discipline that was being introduced. Having failed in all his attempts to obtain employment, he tried his hand at writing, and composed in Flemish the novel, *In het Wonderjaer* 1566 (Ghent, 1837), which, notwithstanding its unprecedented success, left him in debt with his printer. His father refused to do anything for him until he took up some regular employment; and he was thus driven from home in an almost penniless state. At this time, the painter Wappers interested himself for him, and procured him some slight assistance from the king. C. now wrote his *Phantasia*, a collection of fantastic tales, and his celebrated historical novel, *De Leeuw van Vlanderen* (Antw. 1838); but being soon dissatisfied with the small pay and irksome work of the post he had obtained in a government office, he threw up all his avocations, and for a year worked as a gardener. Wappers again befriended him, by inducing the king to give him the place of Registrar at the Royal Academy of Painting at Antwerp. In 1845, he obtained the honorary title of Agrégé of the university of Ghent, and was appointed to instruct the royal children in Flemish. C. has written numerous tales and novels, most of which have been translated into French and German, and some into English—as, for instance, his *Sketches of Flemish Life*, of which several English translations have been made; *Demon of Gold*, *Lion of Flanders*, &c. C. has written two historical novels, *Geschiedenis van Græf Hugo van Craenhove* (1845), and *Jakob van Artevelde* (1849), which are esteemed among his best; but his *forte* lies rather in the delineation of simple village life. His *Illustrated History of Belgium* (1845) is interesting as a national work, but of little value as an authority. In 1870 he published *Bavo en Lieveken;* in 1871, *De Kerels van Vlanderen* (1871); in 1874, *De Keus des Harten* and *Eene Verwarde Zaak;* in 1875, *Schandevrees ;* in 1876, *Gerechtigheid van Hertog Karel*. C. has contributed largely to the revival of Flemish literature.

CO'NSCIOUSNESS. This is perhaps the most comprehensive term employed in designating the mind. If it had been used only in its widest signification, there would have been little difficulty in defining it; but unfortunately there are some exceedingly important meanings of a narrower range that are commonly expressed by it, rendering it an ambiguous or equivocal term, and like all such terms, a source of fallacy and misapprehension.

In the widest meaning, C. is almost identical with mind in action. When we are mentally alive, or performing any of the recognized functions of the mind, we are said to be conscious; while the total cessation of every mental energy is described by the term 'unconsciousness,' among other phrases. In dreamless sleep, in stupor, fainting, and under the influence of the anæsthetic drugs, we are unconscious; in waking, or rallying into renewed mental activity, we are said to become conscious.

As the mind in its waking or active condition may be more or less excited, or vary in the intensity of its manifestations, there are degrees of C.; and, in accordance with a very common usage, the name is apt to be applied to denote the higher degrees in opposition to the lower.

In first learning to write, to cast up sums, or to play on an instrument, our mind is put very much on the stretch; in other words, we are very much excited or highly conscious. When years of incessant practice have consummated the process into a full-formed habit, a very small amount of mental attention is involved; and we may then be said to perform the work all but unconsciously.

We must next avert to the special or restricted meanings of the term, which are those that play the most important part in philosophical discussion. In the first place, we find it applied to denote the mind's cognizance of itself, as opposed to the cognizance or examination of the outer world. Hence, in studying our own minds, we are said to be using C. as the instrument; but in studying minerals or plants, we resort to external observation by the senses. A contrast is thus instituted between C. and observation, which contrast gives to the former word a peculiarly contracted meaning; for in the wide sense above described, observation is truly an act of consciousness.

In the next place, C. is sometimes identified with Belief. We often express a strong affirmation by saying, that we are quite conscious that such a thing is so. It is the strong instinctive tendency of our nature to believe a number of things before we have gone through any large experience of matter of fact. The believing function is a prominent attribute of mental activity. We are scarcely able to feel or act without the operation of belief, or without making assumptions in anticipation of the reality. We believe first, and prove or disprove afterwards. The more intensely we are made conscious, the more strongly we pass into these intuitive convictions.

We unhesitatingly believe in the future persistence and universal prevalence of the order of things that we are born into, until such time as our experience gives us a check. Our emotions all produce beliefs in proportion to their strength. Fear makes us believe in coming evil; joy and elation give confidence in coming good. So that it is true to a certain extent, that the state of belief is engendered along with C., and is stronger as that is stronger; but it does not follow, as is frequently maintained, that to be conscious of every affirmation is to verify it, because our C. cannot be presumed to lie. See COMMON SENSE.

Correct usage, therefore, would dictate the employment of the term in question only in one sense, in which it is co-extensive with being mentally alive, as opposed to sleep, torpor, insensibility, &c. Anything that renders the mental activity more intense, that increases the whirl of the brain (such as strong pleasures and pains, great interest in anything that is going on, &c.) is designated by the positive term C.; the opposite condition, and also the feebler modes of excitement, are expressed by the negative —unconsciousness. All mere special and restricted applications should be forborne, as introducing confusion into thought, and error into philosophy. The study of our own mind may be expressed by such phrases as 'self-consciousness,' 'introspective attention,' and the like. As it is an entire fallacy to talk of C. in general as accrediting doctrines or matters of belief, any acceptation of the word implying this should be avoided.

Points of great importance are involved in the determination of the *conditions* of C., or the circumstances attendant on the manifestation of mental excitement; in other words, the stimulants of our emotional and intellectual wakefulness. The most general and fundamental condition of our becoming conscious, as regards

influences external to the mind, is *change*. The even continuance of one impression tends to unconsciousness; and there are a number of facts that show that if an influence were present in one unvarying degree from the first moment of life to the last, that influence would be to our feeling and knowledge as if it did not exist at all. This important point is more fully illustrated under CONDITIONED.

Immanuel Hermann Fichte (q. v.) made an attempt to establish the existence of a Preconscious Mind, distinct from our conscious life, and not dependent like that upon the bodily organization. He considers the power of germination and growth—or that energy, whatever it is, that unfolds the germ and conducts it to a completely formed organization—as a function of the mind or soul; and couples this power of germination with the following things—namely, the instincts; the process of intelligence that we seem to go through without being aware of the steps, as in the sudden inspirations of men of genius; with all the mysterious phenomena of second-sight, clairvoyance, &c.; and the aggregate of this he erects into a preconscious mind or soul, the contrast of C. as above defined. For the varieties or divisions of our conscious states, see MIND. See also DOUBLE CONSCIOUSNESS.

CONSCRIPTION is not properly synonymous with compulsory military service; Littré defines it, 'the call to military service by the drawing of lots.' The word therefore applies to the system which obtained in France, with intervals, from 1738 till the end of Napoleon III.'s reign. All citizens were liable to be called; but only a certain annual contingent of men for the army (sometimes greater, sometimes less) was demanded from the country; and in the several communes, the corresponding proportion of the youths of the district who had reached military age were selected by lot. With this system was practically bound up the possibility of buying one's self off, or of paying for a substitute. Conscription therefore differed widely from the systematic universal service now required in France, Germany, and some other countries. Since 1872, personal military service is demanded from every Frenchman not physically incapacitated. All are called to enter the army at the age of 20; but those who choose to enlist may enter at 18. The term is for five years in the regular army, 4 in the army reserve, 5 in the territorial army (militia), and 6 in the territorial reserve. This brings the conscript to 40 years of age, when his liability to service ceases. The law of 1872 reorganizing the French army, forbids the providing of substitutes by conscripts. An account is kept of the number of youths in France who reach the age of 20 in each year (about 280,000). All those are exempt from military service who are under 5 feet 2 inches in height; or have any natural infirmities unfitting them for active service; or are the eldest of a family of orphans; or are the only sons of widows, or of disabled fathers, or of fathers above 70 years of age; or are intended for the church; or are pupils at certain colleges. Moreover, if two brothers be called to serve, and the younger is efficient, the elder is declared exempt; and if of two only brothers one is already in the army, or has retired through wounds or infirmity, the other is exempt. Culprits and felons are not allowed to enlist. The law of 1872 making military service obligatory on all Frenchmen (save in the above cases) has assimilated the French army system to that enforced in Prussia since 1813.

CONSECRA'TION is the act of solemnly dedicating a person or thing to the service of God. It was one of the most widely spread religious ceremonies of the ancient world, being practiced in India, Egypt, Chaldæa, Judæa, Greece, Rome, Britain, and other countries. In the Old Testament, we read of the C. or dedication of the first-born, both man and beast, to the Lord; also the dedication of the Levites, of the tabernacle and altar, of fields, houses, walls, &c.

This custom, at least so far as regarded places and things, did not pass immediately from Judaism to Christianity, for the latter being more or less a persecuted religion until the time of Constantine, could not venture to indulge with safety in any public ceremonialism; but no sooner was the sword of persecution sheathed than, according to Eusebius, 'the sight was afforded us, so eagerly desired and prayed for by all—the festivals of dedications and consecrations of the newly erected houses of prayer throughout the cities.' Eusebius himself describes the C. of the church built at Jerusalem by Constantine, 335 A. D. The practice of consecrating religious edifices has continued to the present day in the Roman and Anglican churches. The forms were at first very simple, consisting chiefly of prayer, the celebration of the Lord's Supper, thanksgiving, and benediction; but they afterwards became more numerous and imposing, whilst, also, the bishops and higher dignitaries assumed the power of consecrating entirely to themselves. An important part of the C. of Roman Catholic churches consists in the deposition of relics for a time upon the altar. In the English Church, each bishop is left to his own discretion as to the form of C. to be adopted, but that most generally used is the form sent down by the bishops to the lower houses of convocation in 1712. The English Church also retains the C. of burying-grounds.

C. OF ARCHBISHOPS AND BISHOPS.—According to a canon of the first Nicene Council, there must be four, or at least three bishops present at the C. of an archbishop or bishop. The form used in the Church of England is that prepared in the reign of Edward VI. The Romanists deny the validity of English orders generally, as derived from heretical and improperly consecrated bishops. They had an old story, refuted by their own historian Lingard, which is known as that of the 'Nag's Head Consecration.' According to this story, Archbishop Parker was consecrated at the Nag's Head Tavern, Cheapside, by one of the Protestant bishops present laying a Bible on his head, and saying: 'Take thou authority,' &c. Lingard thus relates the facts: 'Barlow, the deprived Bishop of Bath, and Hodgkins, once Suffragan of Bedford, who had both been consecrated according to the Roman Catholic pontifical, in the reign of Henry VIII., and Scorey, the deprived Bishop of Chichester, and Coverdale, the deprived Bishop of Exeter, who had been both consecrated according to the Reformed ordinal, proceeded to confirm the election of Parker, and then to consecrate him after the form adopted in the reign of Edward VI. A few days later, Parker, as archbishop, confirmed the election of Barlow to the see of Chichester, and of Scorey to that of Hereford, and with these for his assistants consecrated all the other prelates elect.'

The C. took place in the chapel at Lambeth, as appears by the archbishop's register, and Lingard says that there is nothing to countenance the supposition of the entry being other than authentic. The story probably arose from a fact, mentioned by Fuller, that the commissioners who confirmed Parker's election dined at the Nag's Head, a tavern much frequented by the country clergy.

CONSECRATION OF THE ELEMENTS. See LORD'S SUPPER.

CONSE'CUTIVE, a term in Music, applied to octaves and fifths, which, according to the rules of harmony, are strictly forbidden.

CONSEGUIANA, a volcano of Nicaragua, occupies a promontory on the south side of Fonseca Gulf, about ten miles distant from the Pacific Ocean. The crater, at an elevation of about 4000 feet above the mean level of the surrounding country, is about half a mile across, while its interior descends perpendicularly to a depth of 200 feet. In 1835, a fearful eruption, the last on record, converted into a waste a large tract of grazing-land.

CONSE'NT. When we state that C. is the foundation of all contracts and legal obligations of every kind, we state a proposition often in the mouths of lawyers, but the vast magnitude and importance of which is by no means always apparent even to them. The doctrine that the free C. of the parties bound, and not the will of any earthly legislator, or the form in which that will is expressed, constitutes the binding element in contracts, flows as an inevitable logical consequence from the doctrines of personal and political freedom. And yet we continually forget it, and not only speak but act at variance with it. We talk of persons being married by the priest, and divorced by the proctor, whereas it is obvious that a valid marriage, like every other contract, can be made and unmade only by the contracting parties; and that all that either civil or ecclesiastical authority can do, is to ascertain, at the instance of one or other of them, whether it *has* been made or unmade. From overlooking this point of view, differences between legal systems, which are merely external, are often supposed to be fundamental. The law of Scotland, which admits several ways of proving matrimonial C. which the law of England rejects, is on this account supposed to differ from it *in principle*. The only question between them, in reality, is, as to whether the circumstances which the law of Scotland admits in proof of the existence of C. do or do not prove it in point of fact. If it be true that the only means by which it can be ascertained that two persons do agree to be man and wife, is by their declaring their agreement either before a clergyman or before a parliamentary registrar, then the law of England does right in rejecting all other evidence.

If, on the contrary, the fact can be established, as is believed in Scotland, by other means, such as a declaration before witnesses, or an exchange of writings, then the law of Scotland is right in admitting these means of proving it, and making the question of marriage or no-marriage, as it does, one of simple proof. The difference between the two systems is thus seen to be not one of principle, but one of expediency—a question, not in the law of marriage, or of contracts, which is the same in both countries, and in every country, but in the law of evidence.

Yet so strangly illogical are mankind, that in Scotland it is still asked whether or not a marriage can be constituted, in certain circumstances, without a declarator of the Court of Session; and in England, until very recently, no marriage could be dissolved without an act of parliament. The practical question as to how

C. shall be proved, is one surrounded at all times with the greatest difficulty. That its absence may be assumed in the case of all persons of imperfect understanding, and, consequently, that the power of contracting should be denied to idiots, madmen, and pupils, helps us but a very small way. The real difficulty consists in distinguishing, in the case of grown and sane men, between such *real* C. as may be safely assumed to be a deliberate act of the reason, taking that word in its widest sense, and such *apparent* C. as may have had its motive in caprice, passion, ignorance, or any temporary and accidental aberration of mind.

CONSERVA'TION OF FORCE. See FORCE.

CONSE'RVATIVE. See WHIG AND TORY.

CONSERVATOIRE, or CONSERVATO'RIUM (Ital. *conservatorio*), a name given by the Italians to schools instituted for the purpose of advancing the study of music and maintaining its purity. In the earliest times, these schools were partly attached to benevolent institutions and hospitals; others, again, were supported by opulent private individuals. They were originally intended for foudlings, orphans, and the children of poor parents. Some trace their origin to St. Ambrose, Bishop of Milan, in the 4th c., or St. Leo, who flourished in the 5th. The scholars, male and female, all received free board, lodging, clothing, and were taught to sing and play. Extra boarders were also admitted on paying a fee. In Naples, there were at one time three such schools, while in Venice there were four, expressly for females. In 1818, the Neapolitan conservatoires were reduced to one, under the name of Real Collegio di Musica. The Venetian conservatoires shared in the downfall of the Venetian republic. A new grand C. was founded at Milan in 1808, which still exists. In France, the necessity of a school for educating singers gave rise to the *Ecole Royale de Chant et de Déclamation*, in 1784.

During the French Revolution, in consequence of the scarcity of instrumental musicians for the army, the government decreed the erection of an Institut National de Musique, in 1793, which was changed into the present establishment in 1795 under the name of the C. de Musique. The yearly expenses of this C. were fixed at 240,000 francs, the number of masters was 115, and the pupils of both sexes amounted to 600. In 1802, the expense was reduced to 140,000 francs, with a corresponding reduction in the number of masters and pupils. The course of study is divided over 66 different classes, in which all appertaining to music and also declamation is taught by the best masters. The elementary works published by this C. for all instruments are known over the whole world. Other important conservatoires are those of Brussels (founded 1833), Prague, Vienna (1816), and the great conservatorium of Leipzig, established in 1842 under the auspices of Mendelssohn; also those of Cologne, Munich, Stuttgart, Berlin, &c. The Royal College of Music in London, which received a charter in 1882, is designed to rival the conservatoires of the Continent.

CONSERVA'TOR OF THE STAPLE. See CAMPVERE.

CONSERVATORS OF THE PEACE. The sovereign, by virtue of his office, is the principal conservator of the peace within these realms. The function which he thus possesses he may delegate, thus constituting a subject a conservator of the peace. The office, however, must always be exercised in the sovereign's name, and it is for this reason that we always speak of the king's or of the queen's peace. Several high officers of the crown, the Chancellor or Keeper, the Lord High Steward, the Lord Marshal, and the Lord High Constable, when there are such officers, all the justices of the Queen's Bench, the Master of the Rolls, are C. of the P. throughout the whole kingdom, and may commit breakers of the peace or bind them in cognizances anywhere. Other judges possess this power only within the limits of their own jurisdiction. The sheriff and coroner are C. of the P. within their respective counties, and constables, tithing-men, &c., within their jurisdictions. But in addition to these official conservators, others were appointed expressly for the purpose, previous to the appointment of justices of the peace, in the reign of Edward III. Their powers were far inferior to those of the justices, being confined exclusively to the function which the name indicates. The lords of manors frequently possessed the powers of conservators within their manors by prescription, and it was not unusual for lands to be held on the tenure of discharging the duties of a conservator of the peace within the county. Lastly, conservators were appointed by letters-patent from the crown in cases of emergency for the preservation of the peace in particular districts. All these different kinds of conservators, with the exception of these judges and others who are conservators *ex officio*, were superseded by the appointment of Justices of the Peace (q.v.).

CONSE'RVATORY, in Horticulture, a house for the cultivation of tender exotic plants, which, although requiring protection from frosts, and a little assistance of artificial heat, do not need the heat of the hothouse or stove. The only distinction between a C. and a green-house is, that in the former the plants grow in borders of earth; in the latter, they are in pots, and these two characters are often combined. The structure, management, &c., are much the same for the C. as for the green-house; but in the warmer parts of the country, the roof and even the sides are with advantage made capable of being removed in summer. In all situations, the most free and frequent ventilation is requisite. A C. is often attached to a mansion, so as to communicate directly with one or more of the apartments, instead of being placed in the garden.

CO'NSERVES are described by Cooley in his *Cyclopædia of Practical Receipts*, to be 'recent vegetable matter, as flowers, herbs, roots, fruit, and seed, beaten with powdered sugar to the consistence of a stiff paste, so as to preserve them as nearly as possible in their natural freshness.' C. are made by druggists as vehicles for more active medicines, and by confectioners as sweetmeats.

CONSIDÉRANT, VICTOR-PROSPER, a French Socialist, was born in 1805 at Salins, in the department of Jura. After being educated at the Polytechnic School of Paris, he entered the army, which, however, he soon left to promulgate the doctrines of Fourier (q. v.). After the death of his master, C. became the head of the Societarians, and undertook the management of *The Phalanx*, a review devoted to the maintenance and spread of their opinions. Having gained the support of a young Englishman, Mr. Young, who advanced the required sum of money, C. established, 1832, on a large estate in the department Eure et Loire, a Socialist colony or *Phalanstère;* but the experiment failed, and with it *The Phalanx* fell to the ground. However, a new organ of co-operative doctrine, the *Démocratie Pacifique*, was soon established, and was edited by C., who displayed great zeal, perseverance, and ability, in his hopeless battle with the laws of society as now constituted. Among his numerous writings, the chief is the *Destinée Sociale*, dedicated to Louis Philippe. In 1849, C. was accused of high treason, and compelled to escape into Belgium, whence he emigrated to Texas, returned to Brussels, and again went to Texas, where he founded a Societarian community, *La Réunion*, which flourished for a time, but has since come to nothing. C. returned to France in 1869. See COMMUNISM.

CONSIDERA'TION, in Law, the thing given, or done, or the forbearing or suffering something as recompense to another, for doing, giving, forbearing, or suffering. An obligation incurred without C. is, in England, termed voluntary, in Scotland gratuitous; if for C., it is so styled in England, but in Scotland it is called onerous. Considerations are divided in England into good and valuable, the former being affection for a near relative, the latter a pecuniary or other tangible benefit, or marriage. There is no corresponding division in Scotland. But in Scotland, on the other hand, there is, as a general rule, no need for the intervention of a C. to make a contract valid, while in England a contract without a C. is invalid, unless it be evidenced by formal deed (q. v.). In this respect, the law of England is founded upon the maxim of the civil law. *ex nudo pacto non ortur actio;* while the Scottish rule is founded on that of the canon law, *omne verbum de ore fideli cadit in debitum.* But the C. which in England is sufficient to support a contract, may be of the most illusory kind. Thus, an agreement to take less than the full sum in payment of a debt is without C. and because there is no C. to support the agreement to give up the residue; but if the agreement was to take a stick of sealing-wax instead of the money, it is an agreement for valuable C. and binding, and the transfer of the wax extinguishes the debt.

There are some circumstances which, in both countries, warrant the setting aside of obligations without C., whether made by deed or not. In England, they are void as against *bona fide* purchasers, by 27 Eliz. c. 4; and void as against creditors where the grantor is indebted to such creditors at the time to the extent of insolvency, by 13 Eliz. c. 5. A similar rule to the latter is established in Scotland by the act 1696, c. 5, and without proof of insolvency when the deed is granted to a near relation, or a person in a confidential situation, by 1621 c. 18. And all obligations for which the C. is illegal or immoral, are in both countries void.

CONSI'GNMENT, in Mercantile Law, is the term applied to goods which are placed in the hands of an agent or factor, for sale, or for some other specified purpose. Where either the consignor or the consignee becomes bankrupt, questions of nicety often arise regarding ownership, and the consequent rights of the parties and their creditors.

CONSI'STORY (Lat. *consistorium*), properly a place of assembly, but in the later Latinity the word came to signify the particular place where the privy-council or cabinet of the Roman emperor met, and after the time of Diocletian and Constantine, the council itself. The assessors of this council were partly the ordinary members (*comites consistoriani*), such as the imperial chancellor and seneschal, partly extraordinary; and their duty was to deliberate on all the important affairs of legislation, administration and justice.

The *form* of the imperial C. passed over into the early Christian

Church. The bishops established their consistories; and the highest ecclesiastical court, composed only of cardinals (the College of Cardinals), which meets in the Vatican, under the presidency of the pope, to determine all such matters as the appointment of cardinals, archbishops, bishops, &c., still bears this name, as do also the private councils which the pope can call at his pleasure. The Protestant Church of Germany was induced to perpetuate the consistorial courts principally because the episcopal authority passed into the hands of territorial princes (Ger. *Landesfürsten*) not familiar with ecclesiastical affairs. The first Lutheran C. was established at Wittenberg in 1542. After 1555, when the peace of Augsburg secured the recognition of the Protestant religion, similar consistories were gradually formed in other places. The Lutheran consistories exercise a supervision and discipline over religion and education, over the clergy and the schoolmasters, and examine the theological candidates on their trials for license and ordination. They have the regulation of divine worship, the administration of church property, and at an earlier period possessed a certain jurisdiction in regard to marriage.—In the French Protestant churches, the C. possesses a more restricted jurisdiction than in Germany. It exercises authority over a *circonscription*, i. e., a division of the church containing 6000 souls, and is composed of all the pastors of the *circonscription;* together with from 6 to 12 lay-elders elected by a certain number of the people. In that portion of the French Protestant Church which has adopted the Augsburg Confession, the authority of the French monarch is more recognized than in the Reformed Church, for it has a *consistoire général,* composed of delegates, lay and clerical, of the various *circonscriptions,* the president of which is a layman nominated by the emperor.—In England, the word is used to denote the court Christian or spiritual court. Every archbishop and bishop has a consistorial court, held either in his cathedral or other convenient place, before his chancellor or commissary, for ecclesiastical causes. In Scotland, the consistorial courts have lapsed into the commissary-courts. See COMMISSARY.

CONSOLA'TO DEL MA'RÉ. See MERCANTILE LAW.

CO'NSOLE (Fr.), in Architecture, a projection resembling a bracket, frequently in the form of the letter S, used to support cornices, or for placing busts, vases, or figures on. Consoles were often richly ornamented in the under part. The illustration, from Parker's *Glossary,* which is from the palace of Diocletian at Spalatro, belongs to the debased Roman style, and exhibits the zigzag or chevron decoration, which passed from that style into the Romanic architecture of the continent, and into the Saxon and Norman of England. See BRACKET, CANTALIVER.

Console.

CONSOLIDA'TION ACTS. In order to secure uniformity in acts of parliament having reference to public undertakings, and to avoid the necessity of repeating, in each special act, the clauses usually introduced into such acts, the device has been adopted of consolidating or combining all these provisions in one act having reference to the particular kind of undertaking. Of general acts of this nature the most important are, The Companies' Clauses Consolidation Act, 1845 (8 and 9 Vict. c. 16); The Lands' Clauses Consolidation Act, 1845 (8 and 9 Vict. c. 18), amended as to Ireland (14 and 15 Vict. c. 70); and The Railways' Clauses Consolidation Act, 1845 (8 and 9 Vict. c. 20.)

CO'NSOLS, a contraction of Consolidated annuities. In incurring the national debt, government borrowed money at different periods on special conditions, being generally the payment of an annuity of so much per cent. on the sum borrowed. Great confusion arose from the variety of stocks thus created, and it was thought expedient to strike an average of their value, and consolidate them into one fund, kept in one account at the Bank of England. The Consolidated Annuities' Act was passed in 1757. See DEBT, NATIONAL.

CO'NSONANCE, in Music, a term applied to combinations of sounds, whose vibrations when heard together so satisfy the ear that no other sound is wished for, or expected to follow. The more or less satisfying effect of C. depends on the greater or less simplicity of the interval formed by the combined sounds. Intervals whose relative vibrations can be expressed by numbers from 1 to 6, are considered consonant; while those which can only be expressed by the higher numbers, not a duplication of the lower, as 7, 9, 11, 13, &c., are called dissonant. Sounds vibrating as 1 : 1, are unison; as 1 : 2, produce the octave; as 2 : 3, the fifth, which inverted becomes 3 : 4, the fourth; as 4 : 5, the major third, which inverted becomes 5 : 8, the minor sixth; and 5 : 6, the minor third, which inverted becomes 6 : 10, or 3 : 5, the major sixth. Consonant intervals are therefore the third, fourth, fifth, sixth, and octave; from which it follows that there is only one consonant fundamental chord in music, viz., the common chord, or *trias harmonica perfecta,* being a base note with its third, fifth, and octave, which inverted produce the chords of the 6th and the $\frac{6}{4}$. See CHORD. The ancient Greeks admitted of still fewer consonances in their system of music, as they treated the third and sixth as dissonances; a proof that their system of harmony was not the same as ours. Their name for C. was Symphony, and for dissonance, Diaphony. Early in the middle ages, only the octave, fifth, and third were treated as consonances. Franco of Cologne was the first who divided C. into perfect, semi-perfect, and imperfect.

In the writings of Marchettus, and of Joannes de Muris, in the first half of the 14th c., we find already the important rule, that two perfect consonances following in similar progression are not allowable. The study of the C. was carried still further in the 16th c. by Zerlino, who ascertained the true mathematical proportions of the major and minor thirds. Notwithstanding this, Palestrina, up to the end of the same century, and long after him, all who wrote in the same style, carefully avoided the use of the third in the final chord, finishing always with the perfect consonances according to Franco. Of late years, the importance of the C. has attracted the attention of many eminent theorists in music, as well as philosophical writers of undoubted judgment, some of whom do not hesitate to consider the interval of the seventh a C., because it differs from other dissonances in not requiring preparation. There cannot be a doubt that the chord of the seventh, C, E, G, and B flat, considered individually, and not in connection with other chords, is as euphonious and satisfying as the common chord; and when these intervals are placed at the distance from the fundamental note they harmonically arise at, the consonant nature of the combination is still more obvious. A scientific organ-builder in Scotland has long been in the practice of introducing the seventh as an interval in his mixture stops, forming with the fundamental stops a union of sound decidedly consonant, and producing a remarkably brilliant effect. The exact limit of C., or the point where dissonance begins, seems not definitely fixed, if fixed it can be. To define C. to be agreeable sounds, and dissonance to be the reverse, as some do, is clearly absurd, because they both essentially belong to harmony or concord, or as the Germans more properly call it, *Die Kunst des Wohlklangs,* in which there can be nothing absolutely discordant.

A perfect C. causes a musical effect known as Tartini's Grave Harmonic, it having been first observed by the eminent violinist of that name. Along with any two musical notes sounded continuously, there may be heard (if the notes are in accord) a third deeper tone, caused by that number of vibrations which is the greatest common measure of the numbers producing the primary notes, and upon this Tartini founded his theory of harmony (now obsolete), by assuming that the grave note is the natural base of the chord producing it. The note thus sounded may be too deep to be appreciated by the uneducated ear, and these should not be confounded with the 'beats' resulting from the sound of a discordant interval, a species of jar or flutter known to tuners as the consequence of the *imperfection* of a consonance. The subject is treated at length by Professor de Morgan in a paper published in the Transactions of the Cambridge Philosophical Society, 1858.

CO'NSONANT. See LETTERS.

CO'NSORT, literally, one who throws in his lot with another. In English constitutional law, the term is applied to the husband or wife of the reigning sovereign, viewed not in a private but a public capacity, as participating to a certain limited extent in the prerogatives of sovereignty. The extent of these prerogatives in the case of a queen-C. are stated by Blackstone. She is, he says, a public person, exempt and distinct from the king, and 'not, like other married women, so closely connected, as to have lost all legal or separate existence so long as the marriage continues.' For this, Sir Edward Coke gives the curious reason, that 'the wisdom of the common law would not have the king (whose continual care and study is for the public, and *circa arduа regni*) to be troubled and disquieted on account of his wife's domestic affairs.' In addition to this peculiarity in her domestic position, the queen-C. enjoys several exemptions and minute prerogatives. She pays no toll and is not liable to amercement in any court. But where no such exemption is expressly recognized by law in favor of the royal C., she is on a footing of equality with other subjects, and the privileges which the title conveys are chiefly those of precedence, and belong to court etiquette. Up to the year 1857, the husband of Queen Victoria possessed no distinctive English title, and no place in court ceremonial except such as was conceded to him by courtesy. In that year, the title of Prince-C. was conferred upon him by letters-patent.

CONSPI'RACY, a combination between two or more persons to perpetrate an unlawful act. See COMBINATION.

CONSPIRACY BILL. In consequence of an attempt to assassinate the Emperor and Empress of the French whilst going to the opera on the evening of the 14th of January 1858, by the Italian

refugee Orsini and others, by means of explosive shells partly manufactured in England, a bill was introduced into parliament by Lord Palmerston, declaring conspiracy to murder, which the law of England had hitherto treated as a misdemeanor, to be a felony, punishable with penal servitude, and applying that provision to all persons whether English or foreign, and to all conspiracies to murder wherever intended. In place of being regarded merely as a piece of law reform, the C. B. obtained a political character, partly from a dispatch from the French minister, Count Walewski, demanding some such change in our law, and partly from expressions contained in certain addresses which were presented to the Emperor by the French army, and published in the Government organ, the *Moniteur*, which were regarded as insulting to England. The ministry were accused of truckling to France; and though on the motion for leave to bring in the bill they had a majority of 200 (299 against 99), an amendment by Mr. M. Gibson on the second reading, virtually amounting to a vote of censure, was carried by a majority of 19 against them (234 to 215).

CO'NSTABLE (Lat. *constabulus*). Whether this officer was called originally *comes stabuli*, the count of the stable or master of the horse (as alleged by Ducange), or the *koning-stapel*, staff and stay of the king (as Coke, Selden, and others, with less reason, have maintained), the C. both in France and England, was a military personage of the very highest rank. The C. of France rose gradually in importance from the comparatively modest position of an officer of the household, till at last he became, *ex officio*, the commander-in-chief of the army in the absence of the monarch, the highest judge in military offences and in all questions of chivalry and honor, and the supreme regulator and arbitrator in all matters connected with tilts, tournaments, and all martial displays. The office of C. is traced back by Anselme to Alberic, who held it in 1060; but the first C. of France who appeared at the head of an army was Matthew, the second Seigneur de Montmorency. The office was suppressed by Louis XIII. in 1626. Among the offices of the ancient monarchy which were restored by Napoleon for mere purposes of state, that of C. was one. His brother, Prince Louis Napoleon, afterwards king of Holland, was created Grand C., the Vice-C. being Marshal Berthier. The office was again abolished, on the restoration of the Bourbons, and has not since been re-established. But besides the C. of France, almost all the great vassals of the crown had constables who filled analogous offices at their minor courts. There were constables of Burgundy, of Champagne, and of Normandy; the latter of whom may be regarded as the progenitor of the C. of England.

Shortly after the Conquest, a Lord High C. of England appears with powers and privileges closely corresponding to those of the C. of France (13 Rich. II. st. 1. c. 2). His position as judge of the court of chivalry, in conjunction with the Earl Mareschal, and the limitation of his power, which followed on the statute 13 Rich. II. c. 2, are explained under CHIVALRY, COURT OF. The office was abolished by Henry VIII. on the attainder of Edward Stafford, Duke of Buckingham; and a Lord High C. is now appointed only on the occurrence of great state ceremonies, e. g., a coronation. The High C. of Scotland was an officer very similar to the C. of France and England. After the Rebellion, the offices of the inferior constables dependent on the High C., such as the C. of the Castle (q. v.), were abolished, but that of the High C. himself was expressly exempted, and still exists in the noble family of Errol. The privileges attaching to this office are now entirely honorary; but in virtue of it, the Earl of Errol is said to be the first subject in Scotland after the blood-royal; and on the occasion of the visit of King George IV. to Edinburgh, the then earl was allowed to take precedence of the possessors of all other hereditary honors. The present Earl of Errol is the 22d High C. of Scotland.

CONSTABLE OF A CASTLE was the keeper or governor of a castle belonging to the king or to a great baron. These offices were frequently hereditary; thus there were constables or hereditary keepers of the Tower, and of the castles of Dover, Windsor, &c.—CONSTABLE OF THE HUNDRED, and CONSTABLE OF THE VILL, were the predecessors of the high and petty constables of later times. The statute of Winchester (13 Ed. I. st. 2, c. 6), by which the office of high constable is usually, though probably not correctly, said to have been first introduced, ordains that in every hundred or franchise there shall be chosen two constables, to make the view of armor, and to see to the conservation of the peace. The petty constable exercised similar functions within the narrower limits of the township or parish, and was subordinate to the high constable of the hundred. The high constables are appointed by the courts leet of the franchise or hundred over which they preside; or, in default of such appointment (7 and 8 Vict. c. 33, s. 8), by the justices at their special sessions. The appointment of petty constables is by 5 and 6 Vict. c. 109, and 13 and 14 Vict. c. 20, given to justices, who are directed annually to require from the overseers of parishes a list of those within the parish qualified and liable to serve as constables. When not specially exempted, every able-bodied man, between 25 and 55 years of age, resident in the parish, and rated to the poor or a tenant to the value of £4 per annum, must be included in this list. These lists are to be revised by the justices, who shall choose therefrom such number of persons as they deem requisite. No person who has served shall be liable to serve again till all the others are exhausted. Certain penalties are imposed by the act on those who shall refuse to serve, and an oath of office is prescribed. This act entirely supersedes the ancient method of appointing petty constables.—SPECIAL CONSTABLES are persons sworn in by the justices to preserve the peace, or to execute warrants on special occasions. By 1 and 2 Will. IV. c. 41, and 5 and 6 Will. IV. c. 43, any two justices of the peace who shall learn, on the oath of a credible witness, that a tumult, riot, or felony has taken place, or is apprehended, may, if they are of opinion that the ordinary officers are insufficient, swear in as many householders or others as they may think fit (not belonging to the classes of persons exempted from the duties of ordinary petty constables) to act as special constables for a limited time or for a particular place. The lord-lieutenant may also, by direction of one of the principal secretaries of state, cause special constables to be appointed for the whole county, or any part of it, in which case exemptions may be disallowed. For county constabulary, see POLICE.

CO'NSTANCE, LAKE (called by the Germans *Bodensee* or *Bodmansee*, from the old castle of Bodman—*Lacus Brigantinus* of the Romans), lies on the north side of the Alps of Switzerland, and forms a meeting-point of the five territories—Baden, Würtemberg, Bavaria, the Tyrol, and Switzerland.

It has an elevation variously estimated at from 1250 feet to 1385 feet above the sea. Lake C. is traversed by the Rhine from east to west; its greatest length is about 44 miles, utmost breadth 9 miles, and depth 964 feet. It is divided into the upper and lower lakes, the latter of which extends from Constance to Stein. Anciently, the lake was more extensive toward the south than now. In the 4th c., it is said to have extended as far as Rheineck, now some miles distant from the shore. The shores are formed by hilly lands, with low tracts at the mouths of the Rhine and smaller rivers. Cornfields, vineyards, pastures, orchards, and wooded declivities, with here and there the ruins of old castles interspersed, surround the lake. The water, has a dark-green hue, often rises suddenly some ten or twelve feet during a thaw, and rolls in high waves during the prevalence of a strong south, north-west, or east wind. Without visible cause, it sometimes rises and falls to a considerable degree. In one hour, in 1770, it rose between 20 and 24 feet above the ordinary level. It is seldom frozen, except in very severe winters. The lake contains sixty kinds of aquatic fowl; twenty-five species of fish, including fine salmon, and salmon trout; and several species of shell-fish. Since 1824, steam-navigation has added to the facilities of commerce across the lake, and its commercial importance has been greatly increased by the connection of the chief towns on its shores with the railway systems of South Germany and Switzerland.

CONSTANCE, or KOSTNITZ (anciently *Constantia*), a city of Baden, once a free imperial city, is situated on the south shore of the Lake of Constance, at the place where the Rhine connects the upper and lower lakes together. C. is one of the most ancient towns in Germany, but it is very much decayed, its population, once 40,000, being now not more than (1880) 13,372. Its cathedral was erected in the 11th century. C. is notable in history for the ecclesiastical council held in 1414—1418. The object of the Council of C. was to put an end to the disorders in the popedom and in the election of popes, and also to prevent the spread of the doctrines of Huss. There assembled, with the Emperor Sigismund and Pope John XXIII., 26 princes, 140 counts, more than 20 cardinals, 7 patriarchs, 20 archbishops, 91 bishops, 600 prelates and doctors, and about 4000 priests. The three rival popes, John XXIII., Gregory XII., and Benedict XIII., were deposed, and Martin V. was elected. Huss and Jerome of Prague were condemned and burned. The emperor was disappointed in his hope of a thorough ecclesiastical reform, and the Council of Basel was afterwards called to carry on the work which the Council of C. had failed to accomplish. The hall in which the council met is now the market-hall of Constance. C. has manufactures of silk, cotton, and watches, active fisheries, and the cultivation of vineyards and gardens employs a considerable number of the inhabitants.

CO'NSTANT is the name, given in mathematical analysis, to a quantity which remains the same for all cases of the problem, in opposition to a variable. Thus, in questions about the fall of bodies in given times, the force of gravity is a constant quantity. In the integral calculus, the name of constants is given to those quantities which, after integration, are annexed to the integral.

CONSTANT DE REBEQUE, HENRI BENJAMIN, one of the most distinguished political writers and orators of France, was born at Lausanne on the 25th October 1767. Educated in a German college, he afterwards spent some time at Edinburgh Uni-

versity, and here he is supposed to have imbibed those ideas of political freedom which guided him through life. In 1796, he published in Paris a pamphlet on the government then existing, which brought him into note; and three years later, he was placed on the 'Tribunat' by Napoleon, who, however, two years after, dismissed and banished him for the spirit he displayed in resisting the First Consul's encroachments on liberty. During his banishment, he traveled for some time with Madame de Staël, and afterwards settled in Germany. In 1813, he published his celebrated pamphlet, *On the Spirit of Conquest and Usurpation*. In 1814 he returned to Paris, where he wrote several pamphlets in favor of constitutional liberty, which he maintained was enjoyed under Louis XVIII. Napoleon's government he described as a 'government of Mamelukes,' and the emperor himself as 'a Genghis Khan.' Yet during the Hundred Days he became a councillor of state, and assisted in framing the *Acte Additionnel*. In 1819, he was elected a deputy, became ultimately leader of the opposition, and in this capacity gained unbounded popularity. C. de R. was a true patriot. He loved liberty better than the despotic measures of the government of Charles X., he deplored the revolution of July 1830. He died December 1830. As a public speaker, C. de R. was in his day the clearest and most persuasive advocate of constitutional principles in France. As a political writer, he was even fully more effective than as a speaker. Among his works may be mentioned *Discours Prononcés à la Chambre des Députés* (2 vols., Par. 1828), the *Cours de Politique Constitutionnelle* (4 vols., Par. 1817—1820, 2d ed. 1833), in which are collected his minor works on representative government. Among his most ambitious works are *Mémoirs sur les Cent Jours* (Par. 1820), *De la Religion considérée dans sa Source, ses Formes, et ses Développements* (5 vols., Par. 1825—1831), to which posthumous work his *Du Polythéisme Romain, considéré dans ses Rapports avec la Philosophie Grecque et la Religion Chrétienne*, forms a kind of supplement.

CONSTA'NTIA, a district of Cape Colony, in South Africa, lying on the eastern and north-eastern slopes of Table Mountain range, and distant from Cape Town about 12 miles. C. consists of only two estates, Great Constantia and Little Constantia, which have long been famed for the quality of the wines produced upon them. Many attempts have been made in other parts of Cape Colony, as also in France and the south of Europe, to produce a wine similar in quality and flavor to the C., but all have failed; and it is now known that not only to the quality of the C. grape, but also to the character of the soil, as well as to the peculiarly genial exposure of the district, the characteristic excellence of the C. (proper) wines is traceable. The soil of the estates is rich in alkalies to an extent perceptible in the grape itself, and the vineyards have a very equable exposure, being sheltered from all sudden changes of temperature by spurs of the great granite mountain. The grapes under this shelter ripen very uniformly, so that the earthy taste, which spoils the character of other Cape wines, and which is produced by using unpicked grapes of different degrees of ripeness in the same bunch, does not attach to the C. wines.

Although the attempts made on other farms in the colony to produce wines similar to that of C., have failed in so far as the peculiar flavor as well as lusciousness of real C. are concerned, yet they have led of late to great improvements in the quality of several of the South African wines; and where care continues to be bestowed, and the habits of different vines in relation to soil and exposure are more studied, we have evidence in the quality of the improved 'Pontac,' and other wines of Wynberg, of what can be accomplished with increased labor by Cape Colony as a wine-producing country. Statistics of the wine trade of this settlement show, however, that only a small quantity of genuine wines finds its way into the market—much of that which passes under the name being similar but inferior Cape wines. The produce of the C. vineyards sells even in the colony at not less than 6s. per bottle.

CONSTANTI'NA, a town of Spain, in Andalusia, situated in a mountainous district, about 40 miles north-north-east of Seville, to which city it supplies much fruit and ice. It has manufactures of leather and soap, distilleries, flour-mills, &c. Pop. (1877) 10,988.

CONSTANTI'NE, the capital of a province of the same name (the easternmost province of the French colony of Algeria), is situated on a hill with flat summit, three sides of which are washed by the Rummel, flowing through a deep and narrow ravine, and the fourth is connected by a natural mound with the surrounding mountains. Lat. 36° 22′ N., long. 6° 37′ E.

It is 830 feet above the river, and 2162 feet above the sea. It is surrounded by walls constructed by the Arabs out of Roman sculptured stones, and a fine old Roman bridge spans the ravine on one side. The streets, as in the other towns of Barbary, are very narrow and dirty, and the houses mean. An old church in the Byzantine style is included in the citadel. C. was anciently one of the most important towns of Numidia, called *Carta* by the Carthaginians, *Cirta* by the Romans, and was long a royal residence. It was destroyed in the wars of Maxentius against Alexander about 311 A.D., but was soon rebuilt by Constantine the Great, from whom it derives its present name, and continued to subsist, and was a flourishing town in the 12th century. Subsequently, it shared in general the fortunes of Algeria (q. v.). C. has manufactures of woollen cloths, saddlery, and other articles of leather. Population (1876) 39,823, of whom some 7000 are Europeans.

CO'NSTANTINE I., Flavius Valerius Aurelius, surnamed 'the Great,' a Roman emperor, was born 272 or 274 A.D., at Naissus, in Mœsia. He was the eldest son of Constantius Chlorus, and first distinguished himself by his military talents under Diocletian, in that monarch's famous Egyptian expedition, 296; subsequently he served under Galerius in the Persian war. In 305, the two emperors, Diocletian and Maximian, abdicated, and were succeeded by Constantius Chlorus and Galerius. Galerius, who could not endure the brilliant and energetic genius of C., took every means of exposing him to danger, and it is believed that this was the period when he acquired that mixture of reserve, cunning, and wisdom, which was so conspicuous in his conduct in after-years. At last C. fled to his father, who ruled in the West, and joined him at Boulogne just as he was setting out on an expedition against the Picts in North Britain. Constantius died at York, July 25, 306, having proclaimed his son C. his successor. The latter now wrote a conciliatory letter to Galerius, and requested to be acknowledged as Augustus. Galerius did not dare to quarrel with C., yet he granted him the title of Cæsar only. Political complications now increased, and in a short time no less than six emperors were 'in the field'—viz., Galerius, Licinius, and Maximin in the East, and Maximian, Maxentius his son, and Constantine in the West, 308 A.D. Maxentius having quarrelled with his father, forced him to flee from Rome; he took refuge with C., but was ungrateful enough to plot the destruction of his benefactor. This being discovered, he fled to Marseille, the inhabitants of which city gave him up to C., who put him to death, 309 A.D. Maxentius professed great anger at the death of his father, and assembled a large army, with which he threatened Gaul. Crossing the Alps by Mont Cénis, C. thrice defeated Maxentius—first near Turin, then under the walls of Verona, and finally in the vicinity of Rome, 28th October, 312, Maxentius himself in the last of these engagements being drowned in an attempt to escape across the Tiber. C. now entered the capital, disbanded the Prætorians, and adopted other judicious measures for allaying the public excitement. He was also honored with the title of *Pontifex Maximus*, or Supreme Dignitary of the Pagan Hierarchy.

C. was now sole emperor of the West. Similarly, by the death of Galerius in 311, and of Maximin in 313, Licinius became sole emperor of the East. In 314, a war broke out between the two rulers, in which Licinius had the worst, and was fain to conclude a peace by the cession of Illyricum, Pannonia, and Greece. C. gave Licinius his sister Constantina in marriage, and for the next nine years devoted himself vigorously to the correction of abuses in the administration of the laws, to the strengthening of the frontiers of his empire, and to the chastising the barbarians, who learned to fear and respect his power. In 323, he renewed the war with Licinius, whom he defeated, and ultimately put to death. C. was now at the summit of his ambition, the sole governor of the Roman world. He chose Byzantium for his capital, and in 330 solemnly inaugurated it as the seat of government, under the name of Constantinople or City of Constantine. In 324, he committed a deed that has thrown a dark shade over his memory. He had a gallant and accomplished son, named Crispus, who was exceedingly popular, and him, along with Constantina and others, he put to death on a charge of treason. Niebuhr shows that it was not unlikely Crispus cherished ambitious designs. Next year occurred the great Council of Nice. C. sided with the orthodox fathers, probaby for very heterodox reasons. As yet he was a pagan, but his sense of justice, and his conviction of the growing importance of the Christians, both as a moral and political element in the life of the empire, had from the very first induced him to protect them. As early as 313 he had everywhere granted them toleration, and since then continued to favor them more and more decidedly. As president of the Nicene Council, he opposed the Arians, on political grounds, as the weaker party; but not being theologically interested in the dissensions, he refrained from active persecution. During the latter years of his life, Christianity became the state-religion, the pagan temples were closed, and sacrifices forbidden. Yet it was only a short time before his death, which occurred 22d July, 337, that he would allow himself to be baptized.

The question has been much discussed, whether or not C. was a Christian. The truth seems to be, that he looked upon religion as a *statesman*, who feels that his first duty is to rule the nation over which he is set in an orderly and peaceable manner. Had paganism been still in its prime, and possessed any real political

vitality, it is not likely that a man of C.'s secular temperament would have troubled himself in regard to the new faith; but when he found that the latter was making rapid progress in spite of the fiercest persecution, he must have felt it wisest, and probably also conceived it *right*, to protect and favor it. But he continued to the last addicted to many pagan superstitions. As an emperor, however, he ranks very high. He was beloved by his people, for whose welfare he seems to have honestly labored. Severe and even sanguinary towards individuals, he was just and moderate towards nations. He conquered every enemy, organized a new and better mode of government for his vast dominions, crushed all conspiracies and revolts, and passed the close of his life in peace.

CONSTANTINE, PAULOWITCH, a Russian grand-duke, born 8th May 1779, was the second son of the Emperor Paul I. He early distinguished himself by activity, intellectual ability, and a gallantry bordering on foolhardiness, of which he gave remarkable proof at the battle of Austerlitz. After the congress of Vienna, the government of Poland was intrusted to him by his brother, the Emperor Alexander. In January 1822, he executed a private deed by which he resigned his claims to the throne in the event of Alexander's death; and when that event took place in 1825, he adhered to this resignation, although he had meanwhile in his absence been proclaimed emperor in St. Petersburg. The succession thus fell to his younger brother Nicholas. The character of C.'s administration in Poland was not such as to conciliate any class of the people, and a widely ramified conspiracy was formed. The French Revolution of 1830 supplied the spark which set all in flame, and C. was obliged to flee for his life, but he returned in command of the army of reserve. He died, however, of cholera at Vitebsk, on 27th June 1831.

CONSTANTINE, NICOLAEWITCH, grand-duke of Russia, born 21st September 1827, is the second son of the late Emperor Nicholas, and the brother of Alexander II. He is grand-admiral of the Russian fleet, and holds besides innumerable military offices. During the Crimean war, he commanded the Russian fleet in the Baltic, and directed the defensive preparations which held the English and French armaments in check before Cronstadt. The leader of the old Russian party, he strenuously opposed the concessions made to the Western Powers. In 1857, however, he visited the courts of England and France, and in 1871 he paid a second visit to England. On the outbreak of the Polish insurrection in 1862, C. held the office of viceroy of Poland for three months. In January 1865 he was appointed president of the council of the empire.

CONSTANTINO'PLE, called by the Turks *Stamboul* or *Istamboul*, was originally called *Byzantium* (q. v.). In 330 A.D., the Emperor Constantine made it the capital of the Roman empire, and called it after his own name, Constantinople. From this period dates its importance. It continued thenceforth to be the residence of the Roman, and afterwards of the Byzantine emperors, till in 1453 it was taken by the Turks. Since that time it has been the capital of Turkey, and the principal residence of the sultans. It is situated in lat. 41° N., and long. 28° 59′ E., on the European side of the Channel of Constantinople or Thracian Bosporus, near to its opening into the Sea of Marmora. A narrow arm of the sea, called the Golden Horn, extends about five miles into the land, and forms a safe and most commodious harbor, with water of sufficient depth to float the largest men of war. C. proper, to which Europeans give the name of Stamboul to distinguish it from the northern and eastern suburbs of C., lies entirely on the southern side of the Golden Horn, and is protected by a wall built during the time of the Byzantine empire, and partially restored by the Turks.

The wall is about 12½ miles in circuit, and is pierced by 28 gates, amongst which that of Top-Kapussi, formerly that of St. Romanus, has a historic interest, as being the one through which the Turks entered when they stormed the city, and where the last of the Palæologi died in the fight. The suburbs of Galata, Pera, and Top-hanêh are situated on the northern side of the Golden Horn. On the Asiatic side of the Bosporus lie Scutari and Kadiköi (the ancient Chalcedon), and to the north-west of the city lies the town of Eyub. The city itself is built on hilly ground, and from this circumstance, and its numerous gardens, cypresses, mosques, palaces, minarets, and towers, it presents, especially as seen from the side of the Golden Horn, a very splendid appearance. The scenery of the Thracian Bosporus is of almost unrivalled beauty; and the panorama, of which C. forms the principal part, is such as is perhaps nowhere else to be seen in the world. But a nearer appproach reveals the characteristics of an eastern town—narrow, crooked, filthy streets, and miserable houses of wood and clay. Since the Crimean war, however, C. has been wonderfully improved. Great fires, which occurred on the 6th and 7th September 1865, the 3d May 1866, and on 5th June 1870, swept away square miles of old wooden houses on both sides of the Golden Horn. On these spaces handsome stone houses have been built in the modern European style; but this has not been done with much system, and there are in all directions great gaps filled with miserable wooden huts, or left as waste places. The formation of tramways has, however, tended to connect the improved districts by wider thoroughfares, and to form a general plan which is gradually giving to C. the appearance of a European city. C. contains many fine buildings, among which may bementioned the Seraglio, occupying the position of ancient Byzantium, and measuring about three miles in circumference; the former Church of St. Sophia, now a mosque, is a most magnificent structure, in the form of a Greek cross, 269 feet long by 243 broad, and has a flattened dome, greatly admired for its lightness, 180 feet above the ground. The other important mosques are those of Solyman, Achmed, Sultan Mohammed II., and Eyub. The two obelisks of the ancient Hippodrome, called by the Turks the *Atmeidan;* the Castle of the Seven Towers, now in a state of dilapidation; the aqueducts erected by the Emperor Valens; the cistern of Philoxenus, with 424 columns of marble; and the numerous fountains, are among the other most notable objects in Constantinople.

The covered bazaars of C. are very numerous, and the goods are displayed with wonderful attractiveness. One feature of C. is its vast number of lean and hungry dogs which haunt the streets. The dogs are the common property of the city, and they do a considerable portion of the scavenging. Galata, which was founded by the Genoese as a republic in the Byzantine times, is the residence of European merchants and the principal place of trade. It contains many great warehouses, shops, and dwelling-houses, but is, if possible, even more filthy than C. proper. Bridges of boats connect the opposite sides of the Golden Horn. Further eastward, on the Bosporus, lies Top-hanêh, with the imperial cannon foundry, a beautiful mosque, and an interesting fountain. On the hill behind Galata and Top-hanêh, is situated Pera, the residence of the foreign ambassadors. Two-thirds of Pera were burned to the ground by the fire of 5th June 1870. Three thousand houses were then entirely destroyed, including that of the English ambassador; and 40,000 persons were left without shelter. Before the fire, Pera had a European population of 70,000, which was reduced by the catastrophe to more than one-half. Pera is not being rebuilt on its old site, but new streets are spreading round it and Galata. In 1875, Pera was connected with C. by an underground railway 672 yards long, which is reckoned to convey 30,000 passengers daily.

The population of C. and its suburbs has been variously estimated. In 1880 it probably contained from 650,000 to 700,000 inhabitants, of whom about one-half were Mohammedans, one-fourth Greeks and Armenians, one-eighth Franks, and one-eighth Jews. The mosques are more than 300 in number. There are several Greek churches, under a patriarch with twelve synodal bishops. The patriarch is not only the spiritual, but in part also the temporal head of the Greek subjects of the Porte. C. is the residence also of an Armenian patriarch, and there are several Roman Catholic and Protestant places of worship. There are in connection with the mosques about 300 *medresses*, or schools for the ulemas; there are also some 400 *mekteb*, or Turkish elementary schools; and among the other educational institutions is a school of medicine conducted by Germans, which has been the means of much good. Among the benevolent institutions are numerous *imarets*, where food is provided for the poor, and hospitals for the sick of several European nations. There are public libraries, both Turkish and Greek, of which that of the Seraglio is particularly rich in the treasures of oriental literature; and there are several Turkish and European printing-presses.

The public baths and coffee-houses are exceedingly numerous. Some of the peculiar manufactures of the East are carried on in leather, carpets, weapons, &c. But all the manufactures of Western Europe abound in its markets. The trade of C. has, since the Crimean war, been steadily increasing, but is by no means so extensive as might be expected from its population and situation. The burden of the vessels entering and of those clearing the port is estimated at about four millions of tons. The trade is chiefly in the hands of Greeks, Italians, Austrians, British, French, and Germans.

The great strategical value of the site of C. has always lent it a peculiar military and political importance. Extensive fortifications at some distance on the landward side of C. were undertaken during the Russian war of 1877, and were carried out under the superintendence of an English officer in the Turkish service. These lines extend from Buyuk-Tchekmedgi on the Sea of Marmora to Lake Derkos on the Black Sea, a distance of about 20 miles. They run along a range of steep hills, from 200 to 500 feet in height, looking down on a long and wide bare valley. Eight miles distant across the valley runs the parallel range of the Tchataldja Hills, from 500 to 1500 feet high.

C. is now connected by railway with the interior of Northern Turkey, and the north-western part of Asia Minor. The Rumelian Railway from Stamboul to Bellova, was opened in 1873, and will ultimately be connected with the Schumla-Varna line, and

with that from Saloniki to Uskub. C. will thus soon have railway communication with a great part of Turkey.

CONSTELLA'TION (Lat. *con*, together, and *stella*, a star), a group of stars. The stars which stud the firmament have, from a time earlier than authentic records can trace, been formed into artificial groups, which have received names borrowed from fancy or fable. These groups are called constellations. Though quite devoid of anything like systematic arrangement, this traditional grouping is found a sufficiently convenient classification, and still remains the basis of nomenclature for the stars among astronomers. Before the invention of almanacs, the risings and settings of the constellations were looked to by husbandmen, shepherds, and seafaring men as the great landmarks of the seasons, and consequently of the weather which each season was expected to bring with it (see Job xxxviii. 31); and it is not surprising if the storms or calm weather that usually accompanied such seasons were connected in the popular imagination with the influence of the stars themselves, or the beings with whom superstition or fable identified them. Thus, the risings and settings of Bootes with the bright star Arcturus, which took place near the equinoxes, portended great tempests. See Virgil's *Georgics*, i. 204. The great heat in July was ascribed to the rising of Canis the Dog, with its bright star Sirius. See CANICULAR DAYS, and HELIACAL RISING. The appearance of the twins, Castor and Pollux, was hailed as the harbinger of fair summer weather.

Almost all nations have, from early times, arranged the stars into constellations, but it is chiefly from the nomenclature of the Greeks and Romans that our own is derived. Eudoxus, a contemporary of Plato, about 370 years B.C., gave a description of the face of the heavens, containing the names and characters of all the constellations recognized in his time. Though this production is lost, a poetical paraphrase of it, written about a century later by Aratus (q. v.), is still extant. This poem describes twelve zodiacal constellations (see ZODIAC), with twenty in the northern hemisphere, and thirteen in the southern. The next enumeration occurs in the *Almagest* of Ptolemy, which includes the preceding, with three additional, one northern and two southern constellations, making in all 48. These are the ancient stellar groups. Large accessions have been made to the nomenclature in modern times, in consequence of maritime discovery having made us acquainted with constellations in the southern hemisphere which never rose upon the world known to our ancient authors. In 1751, Lacaille went to the Cape for the purpose of making a catalogue of the southern stars, and forming them into constellations—an undertaking which he prosecuted with great ardor for nearly four years at the expense of the French government. Flattery has also contributed towards the stellar nomenclature. Upon the restoration of Charles II., the evening before his return to London, Sir Charles Scarborough, the court physician, was gazing upon a star in the northern heavens, which shone with greater luminosity than usual, as might be expected from a loyal star on such an occasion. This, in connection with a few others, was formed into Cor Caroli, the Heart of Charles II., by Halley, at the doctor's recommendation. The chief constellations will be noticed under their several names. See ARIES, URSA MAJOR, &c. The fanciful figures from which the constellations are named, are depicted on celestial globes and maps of the heavens. In the older writers, Constellation signifies the relative positions of the planets at a given moment. See ASPECT.

CONSTIPA'TION, a state of the system marked by an irregular and sluggish action of the bowels upon their contents, due either to defective secretion of the juices of the intestinal mucous membrane, or to an imperfection of the peristaltic movements (see DIGESTION). Sedentary habits predispose to C., as also does the use of animal food in too great a relative amount. The use of brown bread, or of lentils, oat-meal porridge, of green vegetables and salads, or of ripe fruits; the plentiful employment of salt, or of saline drinks, or of many natural mineral waters; and active exercise, especially by walking or riding on horseback in the open air, tend to avert this disease. A favorite remedy with some is the use of a cloth wrung out of cold water, and applied to the abdomen; this, as used at hydropathic establishments, is called an 'abdominal compress,' and is worn under a bandage of macintosh cloth, to keep the moisture from escaping, during the earlier part of the day.

But to many persons affected with C., and unable from circumstances to follow out the plan of life here indicated, and to many others in whom the disease does not yield to these means, the use of laxatives, or mild cathartics (q. v.), is almost a necessity; and it is satisfactory to know that these remedies, if judiciously selected, and not employed so as to produce over-action, may be taken during very many years without any of the bad effects often ascribed to them.

Constipation in the lower animals depends, as in man, on imperfect secretion from, or motion of, the intestinal walls. In the horse, it is usually accompanied by Colic (q. v.), and when long continued, leads to Enteritis (q. v.). The appropriate remedies are soap and water clysters given every two hours; smart friction and cloths wrung out of hot water applied to the abdomen, with three drachms of aloes, and one of calomel, given in gruel, and repeated in sixteen hours, if no effect is produced. Give, besides, walking exercise; restrict the amount of dry solid food, but allow plenty of thin gruel or other fluids, which may be rendered more laxative by admixture with treacle or a little salt. Similar treatment is called for in dogs, cats, and pigs. In cattle and sheep, digestion principally takes place in the large and quadrisected stomach; the bowels, accordingly, are little liable to derangement; and C., when occurring in these animals, generally depends upon impaction of dry hard food between the leaves of the maniplies, third stomach, or fardel-bag. The complaint is hence called *fardel-bound*. It results from the eating of tough and indigestible food, such as ripe vetches, rye-grass, or clover; it prevails in dry seasons, and on pastures where the herbage is coarse and the water scarce. It occurs amongst cattle partaking freely of hedge-cuttings or shoots of trees, hence its synonym of *wood-evil*. From continuous cramming and want of exercise, it is frequent in stall-feeding animals; whilst from the drying up of the natural secretions, it accompanies most febrile and inflammatory diseases. The milder cases constitute the ordinary form of indigestion in ruminants, are accompanied by what the cow-man terms *loss of cud*, and usually yield to a dose of salts given with an ounce or two of ginger. In more protracted cases, rumination is suspended, appetite gone, constipation and fever are present. There is a grunt noticeable, especially when the animal is moved, and different from that accompanying chest complaints, by its occurrence at the commencement of *ex*piration. By pressing the closed fist upwards and forwards beneath the short ribs on the right side, the round, hard, distended stomach may be felt.

This state of matters may continue for ten days or a fortnight, when the animal, if unrelieved, becomes nauseated, and sinks. Stupor sometimes precedes death, whilst in some seasons and localities, most of the bad cases are accompanied by excitement and frenzy. In this, as in other respects, the disease closely corresponds with stomach-staggers in the horse.

Treatment.—Give purgatives in large doses, combining several together, and exhibiting them with stimulants in plenty of fluid. For a medium sized ox or cow, use ½ lb. each of common and Epsom salts, ten croton beans, and a drachm of calomel, with three ounces of turpentine; and administer this in half a gallon of water. If no effect is produced in twenty hours, repeat the dose. Withhold all solid food; encourage the animal to drink gruel, sloppy mashes, treacle and water; and give exercise, clysters, and occasional hot fomentations to the belly.

CONSTI'TUENT ASSEMBLY. See ASSEMBLY, NATIONAL.

CONSTITU'TION, in Politics (*constitutio*, from Lat. *constituere*, to set up, or establish). In its modern acceptation, C. signifies a system of law established by the sovereign power of a state *for its own guidance*. Such being the ultimate object of a C., its proximate objects, generally stated, are, to fix the limits and define the relations of the legislative, the judicial, and the executive powers of the state, both amongst themselves and with reference to the citizens of the state, regarded as a governed body. Among the Romans, a C. was at first nearly synonymous with the edict of a prætor (see EDICT), and even under the empire signified only an imperial edict or decree. In continental countries, since the formation of the federal government of the United States of America, or, at all events, since the first French Revolution, the idea of a C. has been generally that of a body of written public law, promulgated at once by the sovereign power. See CODE and ASSEMBLY, NATIONAL. In Great Britain it is the whole body of the public law, consuetudinary as well as statutory, which has grown up during the course of ages, and is continually being modified by the action of the general will as interpreted and expressed by the parliamentary representatives of the nation. Much confusion is often introduced into our conceptions of the action of the English and other mixed governments by representing the three elements of which they are generally composed—the monarchical, aristocratic, and democratic (King, Lords, and Commons)—as the centers of three independent sovereignties, whereas they are only three organs through which the one sovereignty finds expression.

There is, and can be, in an independent state, but one sovereignty—one center of power—viz., the general will of the nation. Opposition to this will, from whencesoever it may come, within the state, is treason in the individual, and rebellion in the mass; whereas the vindication of this will by its own act may be revolution, but can never be rebellion. Another source of error consists in supposing this general will to be the numerical aggregate of all the individual wills in the community. It is, on the contrary, the sum of all the wills, not numerically but really, making allowance, that is to say, for the fact that one individual, from the greater clearness of his convictions and strength of his character, often contributes to

this sum, or mass of volition, ten times as much as another individual.

But though the idea of a mixed government is generally associated with that of a C., it does not seem to be inseparable from it. We are not entitled, for example, to deny the name of a C., to a system which is apparently the result of one single will, if to that will the general will has freely confided the task of determining the rules by which it shall be governed. Assuming that the late emperor of the French was invested with supreme power by this ultimate sovereign, the general will, the government which he established was, for the time being, the C. of France. But inasmuch as France had, under the imperial system of government, no parliamentary machinery for effecting desired or desirable changes in its C., the 'right of revolution,' as it is called, became a necessity on the part of those who conceived that they embodied and were in a condition to express the general will. Disorderly as it may seem to us, it was really within the limits of the C., as constitutional as the C. which at any moment it might have overthrown. In a parliamentary government like that of England, however, the right of revolution emerges only when the self-modifying powers of the C. are obstructed or opposed by the executive, as took place in 1688. Whilst in pure monarchies it hangs permanently over the head of the executive, even when acting in accordance with the C., in a free country resistance is rebellion in all cases in which the machinery which the C. possesses for its own modification is unimpeded in its action. Of resistance to this latter kind, the events that culminated in the late American civil war furnish an example.

For a historical account of the English C., see ENGLAND; see also PARLIAMENT, CONGRESS, CODE, CORTES, &c.

CO'NSUBSTANTIA'TION. See TRANSUBSTANTIATION.

CONSUETU'DINARY LAW, is that law which derives its binding character, not from the expressed, but from the tacit consent of the general will of the community. As it is generally transmitted from age to age by oral tradition and universal custom, and is rarely embodied in any positive enactment, C. L. is often spoken of as unwritten law (*lex non scripta*). The customary laws of Normandy, Brittany, and some other provinces of France, however, were reduced to writing; and with us much of the common law, both of England and Scotland, now rests on statute, as well as on custom and usage. Even in modern practice, usage is often resorted to as the best interpreter of law. Of this a familiar example is the important part assigned to mercantile usage in construing the law-merchant. In this case, the custom must generally be established by evidence, in place of being taken for granted, as are the laws of primogeniture, legitim, terce, courtesy, and the like. The effect of custom in repealing statutes will be considered under DESUETUDE. See also COMMON LAW.

CO'NSUL, the title of the two highest ordinary magistrates in the Roman republic. The etymology of the word cannot be precisely determined; thus much, however, seems clear, that it implies that there were more than one—that there were colleagues. The idea of two supreme magistrates, or joint-presidents of the state, seems to have been interwoven with the earliest conceptions of political organization in Rome. According to tradition, there were at first two kings; and the constitution of Servius is said to have provided for the sovereign power being again divided between two functionaries. But it was not till after the expulsion of Tarquin that Lucius Junius Brutus and Lucius Tarquinius Collatinus were chosen joint-heads of the state. These chief-magistrates seem to have been at first called *prætores* (leaders, i. e., of the armies), and the title of *consules* to have been introduced about 300 B.C. At first, the consuls seem to have differed from the kings in little else than their limited tenure of office, and the power which their fellow-citizens retained of calling them to account at its termination. They never assumed the golden crown, but their dress in almost every other respect was regal, and they had ivory scepters surmounted by eagles. In public assemblies, they occupied a sort of throne (*sella curulis*), and in the senate they presided and sat on elevated seats. They made peace and negotiated foreign alliances, had the supreme command of the army, and appointed the public treasurers. They likewise exercised the judicial functions of royalty. In their capacity of supreme judges they continued to be known as *prætores*, until ultimately separate magistrates with that title were appointed. The symbol of their authority was the bundle of rods (*fasces*), with the axe in the center, which was carried before them by twelve lictors.

For a considerable period, the consuls were chosen exclusively from the *populus* or patricians, as opposed to the *plebs;* and during the long struggle between the patricians and plebeians, they sided invariably with their own order. At length, however, two plebeian officers, called *tribuni plebis*, were appointed as a sort of democratic rivals to the aristocratic consuls. To them was assigned the duty of presiding in the assemblies of the plebeians, as the consuls did in the other assemblies; and though they could not dictate, they were entitled by their *veto* to arrest measures proceeding on consular or senatorial authority. The result of this rivalry was, that the consulship was opened to plebeians; and from 172 B.C. down to the period of the empire, the consuls were frequently plebeians. In accordance with the ordinary course of political development, the organization of the Roman state became more complicated, in proportion as it became impossible for the C. to discharge in person the various duties which in the beginning always center in the possessors of supreme power. In 442 B.C., censors (q. v.) were appointed. In 365, prætors had the chief judicial functions of the consuls assigned to them. In the government of the provinces, the aid of the former consuls was called in, the C. thus appointed having the title of *pro-consul*. In sudden and critical emergencies, the consuls were either superseded by a dictator (q. v.), or absolute power for the occasion was conferred on them by the decree of the senate, which ran in the famous formula: *Videant consules ne quid respublica detrimenti capiat*—'Let the consuls look to it, that the state take no harm.' The oath which the consuls took on entering the office they were obliged to repeat as a declaration, not of intention but of fact, on quitting it at the end of the year. The consuls were inaugurated by a great procession to the Capitol and a sacrifice to Jupiter Capitolinus. The shadow of the consulate survived the downfall of liberty; but the election of the consuls was taken from the people and conferred on the senate. Then their number was increased; they were divided into classes—*C. ordinarii, suffecti, honorarii*, &c.—till at last the office became a mere honorary appointment conferred by the emperor.

The title of C. was revived in the French republic. See CONSULATE.

CONSUL, MERCANTILE, the name given to those officers whom the state maintains in foreign countries for the protection of its trade, and vindication of the rights of its merchants, and to whom the further duty is assigned of keeping the home government informed of all facts bearing on the commercial interests of the country. The practice of appointing such officers originated among the trading communities of Italy about the middle of the 12th c., and gradually extended itself; and in the 16th c., had been adopted by all the countries of Europe. In addition to their commercial duties, others of a more strictly political kind were frequently confided to consuls in places in which there was no ambassador or political agent. In almost all the countries of Europe, consuls are divided into consuls-general, consuls, vice-consuls, and consular agents. The C.'s first duty on his arrival, is to exhibit his commission to the authorities of the country to which he is accredited, in order that he may obtain their sanction to his appointment. This sanction is communicated to him in a document called an *exequatur*, which secures to him the enjoyment of such 'privileges, immunities, and exemptions as have been enjoyed by his predecessors, and as are usually granted to consuls in the country in which he is to reside.' The general duties of English consuls are communicated to them in printed instructions. In these the C. is ordered to make himself conversant with the laws and general principles which relate to the trade of Great Britain with foreign parts, and with the language and municipal laws of the country wherein he resides. Further, it is his duty to protect his countrymen in the lawful exercise of their trade, to quiet their differences, to obtain the redress of injuries done them—failing which, to report the matter to the English ambassador at the court of that nation—and to forward to the Secretary of State for Foreign Affairs an annual return of the trade carried on at the different ports within his consulate, as well as a quarterly account of the market prices of agricultural produce during each week of the quarter, the course of exchange, &c. The C. must afford relief to British seamen or other subjects wrecked on the coast, and endeavor to procure them the means of returning to England. The commanders of Queen's ships touching on the coast are entitled to call on him for intelligence, and aid in procuring supplies of water, provisions, and the like; and it is his duty to endeavor to recover all wrecks and stores, &c., of Queen's ships, whether found at sea and brought into the port at which he resides, or thrown on the coast. As regards the 'privileges and immunities' of a C., it is doubtful whether he is in any case exempt from the civil jurisdiction of the state to which he is accredited; and in the case of a trading C., it is at anyrate plain that he is not. But a C. sent out from this country, and not engaging in trade, has always been exempted from the taxes of the country in which he resides. He is generally permitted to call in a guard when he requires it for his own safety, or the preservation of discipline; and in countries not inhabited by a European population, he has all the privileges of an ambassador.

A C. can perform all the acts of a notary-public; all deeds executed by him being acknowledged as valid by our courts of law. The fiction is, that the consulate is the territory of the country

from which the C. is sent, and, consequently, that deeds and acts done within it, or under the C.'s seal, are done in England. Hence the marriage of British subjects recorded in the books of a British C. is a valid ceremony.

In some cases, British consuls are allowed to trade ; in others, they are prohibited from so doing. The salary of consuls-general varies from £300 to £2000, the average being about £1000 : the salary of a consul varies from £100 to £1500, and of a vice-consul, from £50 to £800. A select committee of the House of Commons reported in 1872 that the consular service was still too varied in character and arrangements to be the subject of such organization and classification as other branches of the civil service, but in event of such regulation and revision of the posts as was then recommended, suggested that it would be desirable to introduce changes in that direction. Though of opinion that some posts were underpaid, the committee was opposed to an indiscriminate raising of salaries.

CO'NSULATE (Lat. *consulatus*, consulship), (in France). This supreme magistracy of the French republic was established after the revolution of the 18th Brumaire (q. v.), and lasted to the coronation of Napoleon. On the sudden overthrow of the Directory with the constitution of the year III., the members of the Council of the Ancients and the Five Hundred, or rather those of them who approved of, or submitted to, that act of violence on the part of Bonaparte's grenadiers, appointed three consuls—Sièyes, Bonaparte, and Roger Ducos. This approach to a monarchical government was confirmed, December 13, 1799, by the constitution of the year VIII., by which Bonaparte was made First Consul, with Cambacérès and Debrun as second and third; each was elected for 10 years, and was re-eligible. The powers of the First Consul were made almost absolute. He promulgated the laws, appointed or dismissed ministers, ambassadors, members of the Council of State, military and naval officers, and all civil and criminal judges, except justices of peace and members of the Court of Cassation. His income was fixed at 500,000 francs, and that of his inferior colleagues at 150,000 francs each. Bonaparte took up his residence at the Tuileries, and held a splendid court. By resolutions of the senate, in May 1802, Bonaparte was re-elected for 10 additional years, and in August of the same year was made First Consul for life. In the appeal made to the nation, out of 3,577,259 votes, 3,568,885 were in favor of Bonaparte. The adulation of the senate and people now knew no limit. Nothing but the imperial name and insignia were wanting to complete the picture of absolutism, and these were supplied, May 18, 1804, when Napoleon was made emperor.

CONSU'MPTION, in medical language Phthisis, Tabes, Marasmus (q. v.), and more particularly Phthisis Pulmonalis or pulmonary C., is a disease of great frequency and severity, which, in the civilized nations of Europe, produces from one-sixth to one-tenth of the total mortality in ordinary times. It is uncertain whether there is any part of the world, or any race of men, exempt from C.; this exemption having been at different times claimed for the inhabitants both of hot and cold climates, as for India, Australia, Canada, Iceland, &c., but in most instances in consequence of imperfect knowledge of the facts. On the whole, C. appears to be one of those diseases that have a tendency to increase, unless great care be taken to remove conditions unfavorable to the public health, with the increased aggregation of the human family, and with that extended intercourse which is one of the consequences of an advanced civilization. Hence it is most frequent and most fatal in towns, and most of all in those that are near the great centers of intercourse; while in remote mountain districts, in islands cut off by a wide ocean from the general stream of human communication, it is commonly stated to be, and probably is, comparatively rare. As a rule, however, the presence of this dreadful scourge has almost invariably been discovered to a greater or less extent, wherever the causes of mortality have been carefully examined under enlightened medical superintendence; and we are still very far from having acquired such an insight into its laws of diffusion, as to be able to deduce from them any exact doctrine as to its causation. C. affects peculiarly the young, especially those in the first period of adult life; though it is nearly certain that the seeds of the disease are commonly sown in the constitution in youth, and even in infancy. Its relation to sex is variable, being apparently determined in part by the predominating occupations, and the habits of living, of the population. It is often observed to be plainly inherited from one or the other parent, most frequently the mother; and it is one of the diseases which has been stated to be frequently developed as a consequence of the marriage of cousins or other near relatives, especially when the parental stock is itself tainted or not free from suspicion. In life-insurance, all thesecircumstances are usually carefully weighed by the medical officers of companies, as the grounds for admission or rejection of acandidate for insurance; and nothing is more certain to cause rejection, than a well-grounded suspicion of a consumptive tendency, either personal or derived from the parents, or shown in brothers and sisters. It is therefore a fair subject for consideration, on grounds of ordinary prudence, as well as on those of moral and religious obligation, whether those afflictedwith this malady, or strongly predisposed to it, ought to enter into the married state, and to incur the probable afflictions and responsibilities connected with the maintenance of an unhealthy family. It has even been proposed to legislate on this subject; but sober-minded political economists will probably always consider that it is in vain to constrain by laws the strongest instincts of humanity, especially when the application of the law must depend upon such refined distinctions as in the present instance.

The subject is clearly one for an appeal to the reason and conscience of individuals, rather than for an attempt to lay down theoretical rules of conduct; but those who would guide their lives by principle, and who would not rush into marriage from the inferior motives alone, would do well to take it into serious consideration.

Among the determining causes of C. in large populations, the best ascertained are those connected with overcrowding and bad ventilation, especially when connected with all the depressing influences inherent in poverty, or associated with a reckless and abandoned life. It is certain that much might be done to improve the public health in this respect, by more attention on the part of the employers of labor to the comfort and habits of those who are, in more senses than one, their 'hands,' and the sources of their prosperity. A certain amount of improvement has, indeed, already been effected by the improved living of the working-classes during the last twenty years. Still it is well known, and proved by careful inquiries, that the workshops of tailors, printers, bakers, and other businesses carried on in close, ill-ventilated apartments, by large numbers of workmen, are, in a very aggravated sense, nurseries of consumption. Cotton and linen factories have also been shown, when ill regulated, to be largely responsible for the death of their inmates from this disease. The finest regiments in the army were proved, some years ago, by evidence before a royal commission, to be decimated by this disease in time of peace to a frightful extent, in consequence, probably, of the bad ventilation and deficient comforts of the barracks. The cutlers and needle-grinders of Sheffield appear to owe their notoriously short lives to C., brought on by the inhalation of metallic particles in the close and stifling atmosphere of their workshops. The stone-hewers of Edinburgh and Glasgow, and the colliers of the Lothians, were some years ago in a similar predicament, from the inhalation, in the one case of stone-dust, in the other of lamp-smoke not sufficiently diluted with air. And even agricultural laborers, in many parts of the country, suffer from C. to an extent that is quite appalling, owing to the discomforts, and particularly the close and overcrowded condition of their dwellings. It is lamentable to think that such evils as these exist, and that they might be to a great extent avoided; but this conclusion appears to follow legitimately from the evidence that has been adduced of the intimate connection of C. with overcrowding and a diminished supply of fresh air in workshops and dwellings. Some years ago Dr. Guy published the details of an inquiry into the health of the journeymen printers of London, from which it appeared, in the clearest manner, that the liability of these workmen to spitting of blood, and other well-known symptoms of C., was in exact proportion to the degree to which they had been subject to the evil influences of ill-ventilated workshops; and the marked improvement in the health of our prisons in the present day, has likewise been shown to be to a considerable extent due to the diminished prevalence of C. among the inmates; which, again, is attributed, on good evidence, to the improved construction of the cells, and the increased facilities for wholesome exercise and occupation given to prisoners under confinement for lengthened periods.

It has even been plausibly maintained, that in some of our modern jails C. is less prevalent than it is among the general population of the classes from which prisoners are chiefly taken; so that the depressing influences of confinement and penal discipline are more than counterbalanced by the effect of a regular life, wholesome but plain food, and occupation. Even admitting, therefore, that the causes of C. may be in part irremovable, there is no reason to doubt that very much might be done to diminish its prevalence, as well as to arrest its course. [In 1881 it was confidently affirmed that tubercular consumption was due to the presence in the lungs of specific bacteria (see GERM-THEORY); and antiseptic treatment, such as the inhalation of carbolic acid vapor, has accordingly been recommended.]

The general symptoms of C. are patent to every eye; the more accurate appreciation of them, however, and the use of the more strictly medical means for detecting the disease, and judging of its progress and probable issue, are among the more difficult of the duties of the physician. The disease often escapes attention in its early stages; yet not so much from the absolute difficulty of its detection, as from the insidiousness of its invasion, and the small alarm which its early symptoms excite in the mind of the

sufferer, and even of his friends, when much occupied with the business of life, or when naturally not gifted with the faculty of refined observation. Whenever a young person appears to lose flesh and strength without known cause; when the color changes much from day to day, and from hour to hour; when shiverings are complained of, or even a sense of too great chilliness, alternated by flushings and an oppressive warmth, or too copious perspiration; when with these symptoms there is cough, however slight, or pains between the shoulders and about the shoulder-blades, or below the collar-bones; when there is an occasional tendency to spit up small quantities of blood from the chest, or when the patient is subject to repeated attacks of catarrh (q. v.), or when the bowels are habitually loose or very irregular, or when with any one of these symptoms in the female there is diminution or suppression of the usual periodic discharges, it is not too soon to apprehend the occurrence of C., and to place the patient under medical advice. In some instances the alarm may appear groundless, and health may rapidly return under appropriate treatment; but a far greater danger is that these symptoms, being overlooked or neglected, may prove only the precursors of a more apparently serious attack of disease, and that the first suspicion of C. may arise only after irreparable mischief has taken place. In general terms, it may be said that during the period of adolescence—i. e., before the body has assumed its full development in regard to strength and weight—no considerable check to its advance in these respects ought to pass unnoticed, more especially if attended with habitual feverishness, cough, or other symptoms of impaired health.

Attempts have been made to show, that a peculiar habit of body or physical conformation, apart from disordered health is to be regarded as predisposing to C.; and this has been called the phthisical diathesis (q. v.), but little or no dependence can be placed on any such indications, for this disease unquestionably occurs with nearly equal frequency in all the physiological varieties of the human race, when exposed to its exciting and predisposing causes. The experienced eye of the physician, however, will often discover the lurking germs of this insidious malady, even when active symptoms have been long absent, or have recurred after a long period of comparatively good health, by the effect of former disease upon the development of the frame in the period of childhood. For a similar reason the use of the stethoscope (q. v.), and other means of minutely examining into the state of the chest, will sometimes detect a wholly unexpected attack of pulmonary C. in persons who suppose their lungs to be quite sound, or who have forgotten that they were ever subject to disease. As a rule, however, the symptoms mentioned above are pretty safe guides as to the commencement of C., if care be taken that their gradual progress does not cause them to be overlooked. In a few cases the disease begins otherwise, the form being that of an acute attack, such as fever or inflammation of the chest; but such cases are of course at once detected, as being serious enough to require medical advice.

The further medical history of C. is very complicated, and can hardly be treated of with advantage in a work like the present. Generally speaking, the progress of the disease is marked by the following symptoms: progressive emaciation, with habitual fever and frequent sweating at night; cough and pains in the chest, with expectoration of mucus, and, in the end, of purulent matter in large quantities; diarrhœa (q. v.), and sometimes obstinate vomiting, oftener failure of the appetite, with occasional sickness; gradually increasing weakness and indisposition for active exertion, often with more or less difficulty of breathing on exertion, but rarely with extreme distress or pain of any kind. This remarkable freedom from acute suffering is probably one reason of the self-deception usually attributed to consumptive persons, by which they are led to believe in their curability up to a very advanced stage of the disorder.

The degree to which C. is curable has been a fruitful subject of discussion of late years. Properly speaking, there never has been any doubt that cases marked by all the symptoms of C. occasionally, and even pretty frequently in the early stages, get well; but it was argued that these were probably not genuine instances of what is now alone technically called C.—viz., tubercular disease. In France, where morbid anatomy was extensively cultivated in the beginning of the present century, the incurability of the tubercular form of C. was a general doctrine of the schools till the time of Laennec (q. v.), who, by multiplied instances, and careful observations on the dead body, showed beyond all question the occasional arrest even of advanced C., and the frequent cure of it in the early stages. The appearances in the lungs, and other organs of persons affected with C., will be discussed under TUBERCLE.

The treatment of C. is a very complicated subject, and one much misunderstood, partly owing to the misrepresentations of quacks, and partly from the great demand of palliative remedies on the part of patients and their friends, tending to obscure the true principles of treatment even to the mind of the physician. It is, however, now well ascertained that the greater part of the cure consists in hygienic measures—i. e., the regulation of the mode of living, the occupation, the diet, the clothing, the food, the hours of repose, &c., of the consumptive—and all treatment by drugs is usually regarded by well-informed physicians as subordinate to that just mentioned. A life in the open air to a considerable extent, and in a climate which admits of the enjoyment of such a life even in winter, is the best restorative in cases of incipient C.; yet too much may be sacrificed to the desire of obtaining these advantages, if a genial climate is sought at the expense of the comforts of an English home, or with the effect of producing anxiety of mind, or exhaustion of the body by a long and fatiguing journey. Moreover, to many men a regular occupation is really a necessity in more senses than one; and to break up all the associations of habit in a person debilitated by disease, and not capable of seeking new sources of excitement, is to poison the springs of enjoyment, and render the remainder of life a burden. Many consumptives have been sent abroad only to die, and in all probability to die more miserably, and at an earlier period, than if they had remained at home. On the other hand, the favoring influences of climate are by no means to be rejected, when they can be obtained in accordance with the patient's previously formed habits, and with due regard to his means of occupation and prospects of eventual cure.

A varied and wholesome, but light and unstimulating diet, including abundant dairy produce; flannel coverings next the skin, and clothing which is warm but not oppressive; a well-ventilated sleeping apartment, with a moderate fire in cold weather, bathing in tepid water; the use of a respirator or of a light woollen covering for the mouth and nose in excessively cold weather; avoidance of late hours, crowded rooms, and every kind of dissipation; avoidance also of draughts of cold air, and of sitting in damp clothes or with damp feet; these are the principal circumstances to be kept in view of the ordinary regulation of the life of a consumptive patient. The use of cod-liver oil has been very popular of late years in the treatment of C.; but it may be reasonably doubted whether the reputation of this remedy be due to its powers as a medicine or simply as a fattening food. Occasional small opiates, and other medicines to arrest irritating cough and subdue feverishness, and in special cases the treatment proper to the complications, such as diarrhœa (q. v.) and breathlessness, are generally admitted as useful adjuncts to the means above mentioned; but they can hardly be discussed in this place with advantage, and should be in general used only under medical advice. See Ancell on Tuberculosis —on Phthisis (translated for the Sydenham Society).

Consumption in the Lower Animals.—C. rarely occurs in horses, the health-depressing influences which produce it in man and other animals inducing in them Glanders (q. v.) and Farcy (q. v.). It is also rare among dogs, but is common in oxen and sheep, and still more so in pigs. It is one of the chief causes of death amongst the apes and other denizens of our zoological gardens. It is produced, as in man, by overcrowding, damp lodging, bad food, neglected colds, and the like debilitating causes. It is notoriously hereditary; is frequently developed by breeding from parents nearly related to each other, and mostly affects animals of faulty conformation, prevailing, for example, amongst cows with small thin necks, narrow carcasses, hollow flanks, and dirty unhealthy-looking skins. Such animals are, moreover, subject to dysentery; indeed, the two diseases depend, in cattle, on the same tuberculous or scrofulous state of system; they occur in the same stocks, and often replace each other in different generations. In all animals, the well-marked symptoms are very analogous. In cows, appetite and rumination become irregular; the coat stares, the skin is dry, and firmly adherent to the ribs; the animal is dull, loses flesh, is sometimes feverish, and if in milk, the secretion is diminished, blue, and poor; a tickling cough is easily excited; and diarrhœa is readily set up, and once established, is arrested with difficulty. As the disease advances, the lymphatic glands about the neck and elsewhere are enlarged; the fever, cough, and debility increase; the pulse is weak and quick; the excretions are fœtid; and purulent discharges trickle from the eyes and nostrils. C. in the lower animals is certainly curable, especially in the earlier stages.

The treatment consists mainly in attention to regimen and diet, with careful protection from damp, cold, and other causes inimical to health. The food should be good, easily digested, and nourishing, and the capricious appetite coaxed by frequent variety. For cows, linseed or other convenient oleaginous articles should be freely used. Irregularity of the bowels may be remedied by an occasional dose of treacle, or by a small quantity of linseed or of castor oil; but active purgatives, and, indeed, all powerful and irritating drugs, must be avoided. A few simple tonics may sometimes be advisable. C. might be greatly limited by rejecting, for breeding purposes, all animals having any tuberculous taint, and by greater attention to the feeding, shelter, and warmth of young stock. Neglect of these latter precautions is the cause of its unusual prevalence amongst the young cattle of the more exposed parts of our eastern coast. Its connection with

overcrowding and faulty sanitary arrangements, is evident from its frequent occurrence amongst the cows that have for several months been inmates of our badly managed town-dairies.

CONSUMPTION, in Political Economy, is the converse of Production (q. v.). The word is of very frequent use by political economists, but it has never had a definite meaning attached to it. It may be generally said, that everything which is produced or made by human labor is to be consumed, or to cease in its turn to exist. But there is not only a great difference in the rate at which things are consumed—some going rapidly, while others last for centuries—but there is a C. which is annihilation or loss, and a C. which is in reality gain, or an addition to the wealth of the world. Food is an article of production destined to be immediately consumed, but the food of the working-man sustains him while he is producing more than he consumes. A thousand pounds spent in improving a thousand acres of land, or in building a house, produce something which lasts for many years ere it is consumed or rendered valueless. The same sum spent in raising a wheat crop will seem to be immediately consumed, but it may have in reality been laid out more beneficially than the other, through the process of reproduction. If the thousand pounds laid out on land increases the value of that land so as to make it worth eleven hundred pounds, while the wheat raised by the expenditure of the other thousand is sold for fifteen hundred pounds, there is less C. in the latter expenditure than the former. If the thousand pounds on the other hand, be expended on squibs and sky-rockets, the C. is greater still. The makers of the squibs and sky-rockets no doubt live, but it would tend less to C. if they lived by making something that would last.

CO'NTACT. In Geometry, two lines, one of which at least is curved, are said to be in C. when they have a common point from which they recede, in such a way that the deflection of the one from the other will, if a sufficiently small departure be taken, become as small a fraction as we please of that departure. A complete discussion of the nature and order of C. can be obtained only by means of the differential calculus.

CONTA'GION, the communication of a disease from the sick to the healthy, either by direct contact of a part affected with the disease, or through the medium of the excretions and exhalations of the body. Some authorities have employed the term infection (q. v.) to designate this latter method of communication, and have correspondingly limited the meaning of the word C.; but no practical end is served by this refinement, and it has indeed led to great confusion by obscuring the fact of the communication, which is, when clearly proved by instances, the most important element in the inquiry. If of a given number of healthy persons exposed to association with the sick, a much larger proportion becomes ill than can be reasonably accounted for on general principles, or than is actually observed among persons of similar habits not exposed to this cause of disease, the disease is said to be propagated by C.; and if the characters of the disease are well marked, and nearly similar throughout the group of cases, it is said to be due to a specific C., which may be in some cases shown to be capable of reproducing the primary disease to an illimitable extent, being conveyed (as in the case of syphilis, q. v.), either through the liquid secretions of the affected part, or (as in the case of small-pox) in this way, and also through the aërial exhalations. Contagious diseases are generally epidemic (q. v.) in their mode of propagation, attacking large numbers of people at once, and traveling from place to place. But some epidemics are not contagious, as Influenza (q. v.)

CONTAGIOUS DISEASES (Women) ACTS were passed in 1865, 1867, and 1868 for the seaport and military towns, Aldershot, Canterbury, Chatham, Colchester, Dover, Gravesend, Maidstone, Plymouth and Devonport, Portsmouth, Sheerness, Shorncliffe, Southampton, Winchester, Windsor, and Woolwich; and in Ireland, the Curragh, Cork, and Queenstown. The policy of these Acts has since been keenly canvassed, one party denouncing them as demoralizing and degrading, the other party defending them on purely sanitary grounds. They authorize a justice of the peace, on the sworn information of a superintendent of police that a woman within the above area is a common prostitute suffering from venereal disease, to cause her to be examined, and if necessary detained in a hospital.

She is, however, first entitled to notice, so that she may submit voluntarily to examination. The limit of detention in hospital is three months to nine months. She may be convicted for refusing to attend for examination, and imprisoned for one month; and for a second offence, three months. If she considers herself cured, she can demand to be taken before a justice, who, on reasonable evidence, can discharge her. Occupiers of houses are liable to a penalty for permitting a woman uncured to resort to or be in their houses. The justice hears the case in private; but if the woman demands it, he must hear her in open court. These acts have always been strongly disapproved of by a large section of the public. A Select Committee of the House of Commons on the effect of the Acts issued an elaborate report in 1882. In the debate on supply in 1883, Mr. Stansfeld's motion, that these acts had neither checked disease nor promoted morality, was carried by a large majority; the vote of supply accordingly was lost. The administration of the acts was suspended, and the acts practically abrogated for the time being.

CONTARI'NI, the name of a noble family in Venice, one of the twelve that elected the first Doge. Between 1041 and 1674, seven Doges were furnished by this family, and several of its members were men of note.—Ambrogio C. was sent as ambassador from Venice to Persia, 1473—1477, and gave an account of his travels in his *Viaggi fatti da Venitia, alla Tana, in Persia, in India, et in Constantinopoli* (Ven. 1487).—Cardinal Gasparo C. distinguished himself as Venetian ambassador at the court of Charles V., and was papal legate at the diet of Ratisbon, 1541, where he displayed great moderation.—Giovanni C., born 1549, was one of the most famous painters of his time; he painted the Resurrection, in San Francisco di Paolo's, in Venice.—Vincenzo C., born 1577, had acquired, at the age of 26, such a fame for learning, that the magistrates of Padua, in order to secure him for their university, established an extraordinary professorship of Greek and Latin eloquence.

CONTE'MPT, against the crown's ecclesiastical supremacy, by assuming local ecclesiastical titles under the authority of the court of Rome, is forbidden under penalties by 10 Geo. IV. c. 7, s. 24, and by 14 and 15 Vict. c. 60.

CONTEMPT, against the sovereign's title. See Præmunire.

CONTEMPT OF COURT. There is probably no country in which courts of law are not furnished with the means of vindicating their authority and preserving their dignity by calling in the aid of the executive, in certain circumstances, without the formalities usually attending a trial and sentence.

Of this the simplest instance is where a judge orders the police to enforce silence, or to clear the court. Contempts by resisting the process of a court, are in England punished by Attachment (q. v.); contempts done in the face of the court, by directly obstructing its proceedings, may be visited with commitment and fine. Striking a supreme judge in the discharge of his duty, or even threatening him by drawing a weapon, or the like, has been an offence at common law in England of the highest kind since the times of the Anglo-Saxons; and in Scotland it is a statutory offence, punishable either capitally or by very severe arbitrary pains (1593, c. 173; 1600, c. 4). See Judge. In the latter country, minor contempts are punishable arbitrarily, either *ex proprio motu* of the court, where the offence has come under its immediate observation, or by a summary complaint at the instance of the public prosecutor, where, though not committed in the immediate presence of the court, it has relation to a matter which is, or has been recently, in dependence before it.

CONTEMPT OF PARLIAMENT. See Parliament.

CONTI, House of, a branch of the House of Condé (q. v.). Armand de Bourbon, first prince of C., and brother of the great Condé, was born at Paris in 1629. He took his title from the little town of Conti, situated five leagues from Amiens. Of a feeble constitution and deformed shape, he was early destined for the church, but the fame of his brother inspired him with military ardor. He commenced his martial career as the opponent of his brother, but soon entered into an alliance with him. After 1657, he retired from the world, and gave himself up, without reserve, to devotion. He died at Pezenas in 1666.—Louis Armand, Prince de Conti, Comte de Pezenas, and peer of France, eldest son of the preceding, was born in 1661. After a short career in arms, he died of smallpox at Fontainebleau, 5th November 1685. He left no children, and was succeeded by his brother François Louis, Prince de la Roche-sur-Yon et de Conti, who was born at Paris in 1664. This was the most remarkable member of the family. Educated under the eyes of the great Condé, he early conceived a passion for bearing arms. His first campaign was made in Hungary, where he distinguished himself; but having fallen into disgrace with the court, he was banished to Chantilly, with strict orders not to leave it. The great Condé, before his death, persuaded Louis XIV. to pardon him. Subsequently, C. served under the Duc de Luxembourg, who was warmly attached to him, and took a brilliant part in the victories of Steinkirk and Neerwinden.

In 1697, he narrowly escaped being made king of Poland. On his return to France he was still coldly received by Louis, who, however, was at last forced by disaster to employ him. He received the command of the army of Flanders in 1709, but died on the 22d February of the same year. Massillon pronounced his funeral oration. Saint-Simon, in his celebrated *Mémoires*, thus speaks of him: 'He was the delight of armies, the divinity of the people, the hero of officers, the darling of parliament, and the admiration of the most learned savans.'—The last member of the House of C. was Louis François Joseph, born 1734, died in Spain 1807.

CO'NTINENT. Though no mathematical distinction has ever been drawn between a C. and an island, the usage of language has generally recognized five great masses or divisions of land as continents—Europe, Asia, Africa, America, and Australia. Europe, Asia, and Africa form properly one great C., the only one known to the ancients; the second was discovered by Columbus; and the third made its appearance at the antipodes of Europe in the beginning of the 17th century. The existence of an antarctic C. has not yet been satisfactorily established. The apparent irregularity in the shape of the continents disappears on nearer examination, and certain uniformities become apparent, the causes of which have long been subjects of speculation. Bacon remarked, that the continents were pointed towards the south polar sea, and presented broad conformations toward the north. J. R. Forster followed up this remark by the generalization, that these southern points are the ends of mountain-ranges, which are continued northwards; and that at the east side of these promontories there are always larger or smaller archipelagos of islands, while the west side of the continents is indented with large bays.

Not only have attempts been made to reduce the horizontal outlines of the continents to rule, but their vertical dimensions have been examined with the same view. Observation had been confined to ascertaining the heights of individual summits, until Alexander von Humboldt enriched physical geography with a new numerical element, by endeavoring to determine the mean height of continents—i. e., the elevation of the center of gravity of their mass. He estimated the mean height of Europe at 103 toises (a toise is about 6 feet 6 inches), of North America at 117, of South America at 177, and of Asia at 180 toises. Laplace had calculated the mean height of all the continents at 1000 metres; Humboldt found this too great by two-thirds, and gives the height of the center of gravity of all the continents, except Africa, above the sea-level at 307 metres, or 1007 feet.

CONTINE'NTAL SYSTEM; BERLIN DECREE; ORDERS IN COUNCIL. The C. S. was the name given to Napoleon's plan for shutting England out from all connection with the continent of Europe, and thus compelling her at least to acknowledge the maritime law established at the peace of Utrecht. See NEUTRALITY. This system began with Napoleon's famous 'Berlin Decree' of November 21, 1806, which declared the British islands in a state of blockade, and prohibited all commerce and correspondence with them; every Englishman found in a country occupied by French troops or by their allies was declared a prisoner of war; all merchandise belonging to an Englishman, lawful prize; and all trade in English goods entirely prohibited. No ship coming direct from England, or from a British colony, was allowed to enter any port; and any ship seeking by false declarations to evade the regulation, was confiscated with its cargo as if British property.

England was not long in making reprisals. By an 'order in council,' issued January 7, 1807, all neutral vessels were prohibited from entering any port belonging to France or her allies, or under her control. Every neutral vessel violating this order was to be confiscated with its cargo. Still more oppressive for neutral commerce was a second order in council of November 11, 1807, by which all harbors and places of France, and her allies in Europe and the colonies, as well as of every country with which England was at war, and from which the English flag was excluded, were placed under the same restrictions as if strictly blockaded. These orders were followed by reprisals on the French side. By the Milan Decree of December 17, 1807, strengthened by a second of January 11, 1808, from the Tuileries, any vessel, of whatever nation, that had been searched by an English ship, had submitted to be sent on a voyage to England, or paid any duty to the English government, was to be declared *denationalized*, and treated as English. In order the more effectually to annihilate English commerce, there appeared, August 3, 1810, the tariff of Trianon for colonial goods; this was extended by a decree of 12th September, and on the 18th October followed the Decree of Fontainbleau, ordering the burning of all English goods; an order which was to be carried out with more or less modification in all countries connected with France.

The consequence of the C. S. was undoubtedly the springing up on the continent of many branches of manufacture to the prejudice of England; on the other hand, the price of foreign produce rose to an extraordinary height on the continent, enabling a few commercial men to make fortunes, but sensibly affecting the daily comfort of the middle classes. This violent interruption of human intercourse and sociability was an unnatural condition, which could not last long, and could only serve to strengthen the hatred of Europe against French tyranny. Accordingly, with the breaking up of Napoleon's power, the C. S. fell to the ground.

CONTI'NGENCY, in Law, an event, the occurrence of which, though uncertain, is sufficiently probable to be provided for. Thus, contingent debts, by the law of Scotland, are taken into account in estimating the claims on the estate of a bankrupt, though a contingent creditor is not entitled to concur in a petition for sequestration, or to vote in the election of a trustee, until his claim shall be valued.

CONTI'NGENT is the quota of troops furnished to the common army by each member of an alliance or confederation of states. The word was especially applied to the proportions contributed by the several German states to the army of the confederation, which has given place to the empire. See GERMANY.

CONTI'NUED FRACTIONS. See FRACTIONS.

CONTO'RNIATE (Ital. *contorno*, Fr. *contour*), a term applied to a class of antique medals, which have a deep line cut round the edge, like a furrow.

CONTO'RTED STRATA are beds which are bent and twisted, so that in a section their edges would be seen to follow crooked and curved lines, often doubling back and running altogether out of their former course. An account of extensive C. S. will be found under the article APPALACHIANS.

CO'NTRA, a term in Music, meaning opposite, lower, and applied to the alto and tenor parts when they form the lowest part in the harmony. When a part lower than the usual bass is employed, it is called contra-basso. C. is also used in organ-building, to indicate that a certain stop, or register of pipes, is an octave lower than the usual pitch.

CONTRA BASS, or VIOLO'NE, the largest species of stringed instrument, commonly called the double bass. In Britain, this class of instrument has three strings, the lowest being A, a minor third below the low C of the violoncello; the next is a fourth above, viz., D; and the highest is G, a fourth above D. This manner of stringing is defective, as all the great masters have written for the C. B. down to E, for which reason the German instruments have all four strings, the lowest a fourth below our low A. C. B. is also the name of an organ stop of 16 feet pitch.

CONTRABAND OF WAR (Lat. *contra bannum*, against the proclamation), is a name applied to certain commodities, or the rules relating to them, during hostilities between states which acknowledge what are called the laws of nations. One such law is, that neutral nations must not carry on, for the advantage of either of the belligerent powers, any branches of commerce from which they are excluded in time of peace. Another is, that the name of C. of W. shall be given to such articles as pertain to military or naval warfare—guns, ammunition, and stores of all kinds. Unless there are special treaties defining exactly what articles are C. of W., the interpretation of this law often leads to much embarrassment. Another law insisted on by England during the last great war was, that each belligerent shall have a right to visit and examine neutral ships, to see whether they carry any articles which are C. of W., and which seem likely to be intended for the enemy. A neutral state may carry on ordinary trade with either belligerent, except when prevented by blockade (see BLOCKADE); but the ships, according to the above rules, must not contain articles C. of W.; nor must a conterminous land frontier be crossed by such commodities. If a merchant evades these rules, he does so at his own risk; his merchandise may be seized, and his own government will not protect him. By the law and practice of nations, it is for the Admiralty Court of the capturing power to decide what is or what is not contraband of war. Upon such questions it is the province of this tribunal to adjudicate; and from its final judgment there is no appeal. At various times, discussions have arisen whether corn, hay, or coal, can ever be included in the list of articles C. of W.; they are obviously articles of peaceful commerce, but they are also essential to the maintenance of an army, and sometimes a supply would give one belligerent a great advantage over the other. Especially is this the case in reference to coal, in the present age of war-steamers.—Contraband in commerce depends upon the special laws of each country. See SMUGGLING.

CO'NTRACT. For a statement of the principles on which contracts in general are founded, see CONSENT.

CONTRA'CTIONS. The wish or necessity of economizing labor and parchment, led the scribes of the middle ages to use a great many abbreviations or C. in their manuscripts. These C. were transplanted into the first printed books; and more recently they have been reproduced in many works, as well in this country as on the continent, where it was thought desirable that the modern print should represent as nearly as possible all the peculiarities of the ancient manuscript. A knowledge of C., therefore, is indispensable not only to readers of old writings, but to readers of the printed books of the 15th, the 16th, and the earlier part of the 17th centuries, and to all who desire to avail themselves of the vast stores of historical and archæological materials accumulated in the rolls and records published by the governments of Great Britain, France, and other countries.

C. may be divided into six classes: 1. C., properly so called; 2. C. by elision or suspension; 3. C. by writing a smaller letter

above the word contracted; 4. C. by running two or more letters into one character; 5. C. by symbols representing syllables or words; 6. C. by initial letters.

1. *Of C., properly so called*, there are three great kinds: (I.) A straight line over a letter denotes the omission of an *m* or an *n* after it, as in the following examples:

ā ānus, *annus*; quā, *quam*; faciāt, *faciant*; tenendā, *tenendam*.
ē faciēt, *facient*; regē, *regem*; seruiētibus, *seruientibus*.
ī statī, *statim*; ī, *in*; īmediate, *immediate*.
m̄ om̄es, *omnes*; om̄ia, *omnia*; om̄i, *omni*.
ō nō, *non*; cōmunis, *communis*; hōines, *homines*; cōcessa, *concessa*.
ū hūc, *hunc*; volūtatē, *voluntatem*; festū, *festum*; hōiū, *hominum*.

(II.) A crooked or circumflex line over or through a letter signifies that one or more letters are omitted after it—occasionally both before and after it—thus:

ã cã, *causa*; añ, *ante*; aña, *antea*; añlo, *angelo*; miãm, *misericordiam*.
ꝑ ꝑe, *beate*; ꝑi, *beati*; noꝑ, *nobis*; liꝑtatē, *libertatem*.
ꝑꝑ aꝑꝑe, *abbate*; aꝑꝑ, *abbas*.
ꝯ aꝯus, *dictus*; ecc̃ia, *ecclesia*; sc̃a, *sancta*.
ꝓ ꝓ, *de*; ꝓ, *dans*; ꝓo, *deo*; dn̄s, *dominus*; dn̄i, *domini*; ebda, *ebdomada*.
ꝺ *David*; ꝺ ꝺ, *David*.
ẽ ẽe, *esse*; ẽ, *est*.
�fr fr, *frater*.
g̃ mag̃ro, *magistro*; mg̃r, *magister*; mag̃, *magis*.
h̃ h̃eat, *habeat*; h̃ui, *habui*; h̃nt, *habent*.
ĩ aĩa, *anima*; aĩal, *animal*; aĩā, *animam*; feĩa, *femina*; mĩe, *minime*; oĩo, *omnino*.
k̃ k̃mus, *karissimus*; k̃mi, *karissimi*.
ꝉ fiꝉ, *filio*; vꝉ, *vel*; ꝉia, *licentia*; ꝉ, *lege*; ꝉr, *libenter*; pꝉaꝉ, *pluralis*.
ll̃ ball̃is, *ballivis*; sigill̃, *sigillo*; Will̃mo, *Willelmo*.
m̃ om̃es, *omnes*; hom̃ibus, *hominibus*; com̃, *comite*; m̃s, *meus*; tm̃, *tantum*, *tam*, *tamen*.
n̄ dn̄s, *dominus*; n̄r, *noster*; n̄ro, *nostro*; n̄dū, *nondum*; tn̄, *tandem*, *tamen*; sn̄iā, *sententiam*.
õ õia, *omnia*; õro, *oratio*; rõis, *rationis*.
p̃ ep̃is, *episcopis*; p̃p̃, *papa*; ap̃lice, *apostolice*; p̃r, *pater*; tp̃s, *tempus*.
q̃ q̃stio, *questio*; extorq̃re, *extorquere*.
r̃ gr̃a, *gratia*; nr̃m, *nostrum*; pr̃, *pater*; pr̃na, *paterna*.
s̃ s̃btus, *subtus*; s̃, *sum*, *sunt*; s̃s, *suis*.
t̃ dict̃, *dictus*, *dicti*, *dicto*, *dictum*; salt̃, *salutem*; it̃m, *item*; t̃c, *tunc*.
ũ aũ, *autem*; ũre, *uestre*; ũba, *uerba*.
ṽ ṽr, *vester*; ṽris, *vestris*.

(III.) The sign ᵓ over a letter shows that *er*—or occasionally *re*—is omitted after it, as:

Ꝭ haꝬe, *habere*.
ꝯ ꝯto, *certo*; exerꝯe, *exercere*; feꝯit, *fecerit*.
ꝑ possiꝑe, *possidere*; evaꝑe, *evadere*.
ꝼ ꝼvida, *fervida*; preꝼre, *preferre*.
ᵹ infringᵹe, *infringere*; eᵹssum, *egressum*; transᵹressor, *transgressor*.
ꝛ ꝛes, *heres*; coꝛcioni, *cohercioni*.
ꝕ cꝕicus, *clericus*; expelꝕe, *expellere*.
ꝛꝛ amꝛcietur, *amercietur*; ꝛꝛcis, *mercis*; ꝛꝛcator, *mercator*.
ꝓ oꝓa, *onera*; geꝓosi, *generosi*; itiꝓe, *itinere*.
ꝙ inquiꝙe, *inquirere*.
ꝝ ꝝvus, *servus*; ꝝvicium, *servicium*.
ꝑ ceꝑa, *cetera*; ꝑram, *terram*; ꝑs, *tres*; ꝑr, *ter*.
ꝟ fꝟit, *fuerit*; hꝟit, *habuerit*.
ꝶ ꝶbo, *verbo*; oꝶtes, *overtes*; reꝶt̃e, *revertere*.
ꝴ eꝴcitum, *exercitum*.

2. *In C. by elision or suspension*, the word is not fully written, the want of the terminating letters being denoted by the marks ⸗, or ', or .; thus:

assꝫ	*assisa*.	dat.	*datum*.
test'	*teste*.	temp.	*tempore*.

3. *C. by writing a smaller letter above the word contracted.*—If the letter so written be a vowel, it denotes the omission of a consonant; if a consonant, the omission of a vowel. Occasionally the omission extends to two or more letters, whether vowels or consonants.

qᵃm	*quam*.	mᵒ	*millesimo*, *modo*.
gᵃtia	*gratia*.	intᵒitus	*introitus*.
occₐone	*occasione*.	magᵒ	*magistro*.
pⁱmis	*primis*.	mᵒasteriū	*monasterium*.
mⁱ	*mihi*.	pʳsas	*prisas*.
nⁱ	*nisi*.	figʳa	*figura*.
sⁱ	*sibi*.	cꝛcis	*crucis*.
impⁱsonetʳ	*imprisonetur*.		

4. *Of C. by running two or more letters into one character*, the diphthongs *æ* and *œ*, and the sign *&* for *et*, are familiar examples. The modern *&* has often, in old writings and books, the form of ⁊, and 7, and ⁊. A circumflex over this last character ⁊̂ represents *etiam*.

5. *C. by symbols representing syllables or words.*—The most common of these are shown in the following table:

cō *cio*; invencōe, *invencione*.
ꝯ *con* or *com*; ꝯuentus, *conuentus*; ꝯpellere, *compellere*.
ꝑ *pre*; ꝑ oculis, *pre oculis*; ꝑstito, *prestito*.
ꝓ *per*, *par*, and *por*; ꝓpetuo, *perpetuo*; ꝓ atus, *paratus*; corꝓum, *corporum*; ꝓnª, *persona*.
ꝓ *pro*; ꝓprio, *proprio*; ꝓ ꝓpetuo, *pro perpetuo*.
ꝗ *que*; absꝗ, *absque*.
ꝝ *rum*; ꝙuoꝝ, *seruorum*.
ꝛ *ser*; ꝛuicio, *seruicio*.
ꝫ *us* and *et*; quibꝫ, *quibus*; quilibꝫ, *quilibet*; sꝫ, *set* (*sed*).
ꝛ *ur*; auditᵒis, *audituris*; visᵒis, *visuris*.
ꝰ *us*, *os*, and *ost*; hujꝰ, *hujus*; dedimꝰ, *dedimus*; pᵒ, *post*; pᵒt, *post*; pᵒtea, *postea*.
ꝣ *tz*; fiꝣ, *fitz*.
ꝭ *is*; Scotꝭe, *Scottis*; lordꝭe, *lordis*.
ꝭ *est*.
ẽ *est*.
gª *igitur*.
gᵒ *ergo*.
hꝰ *hic*.
ñ *hec* or *hoc*.
ꝟ *vel*.
ñ *non*.
q̃ *que*.
ꝙ *quod*.
ꝓª *quam*.
qᶻ *quia*.

6. *Of the more common C. by initials*, a list has already been given in this work, under ABBREVIATIONS (q. v.). In this way of writing, a whole sentence may be expressed without so much as one word being written at length, as in the well-known epistolary form S.V.B.E.E.Q.V.; that is, *Si vales, bene est, ego quidem valeo*. Among the initials used in old writings and books, it will suffice here to mention the following:

A.	Alexander, Alanus, Arthurus.
B.	Benedictus, Bernardus, Bonifacius.
B.M.V	Beata Maria Virgo.
B.P.	Beatus Paulus, *or* Petrus.
B.V.	Bene vale.
C.TT.	Cardinalis Tituli.
D.	David, Durandus, Duncanus.

D.N.PP.	Dominus Noster Papa.
E.R.	Ecclesia Romana.
F.F.F.	Fiat, Fiat, Fiat.
G.	Gulielmus, Gilbertus, Guido, Georgius.
G.G.	Gregorius.
I.C. or I.X.	Jesus Christus.
I.D.N.	In Dei Nomine.
J.	Johannes, Jacobus, Julietta, Josephus.
M.	Malcolmus, Martinus, Matilda, Maria.
N.E.R.	Notarius Ecclesiæ Romanæ.
O.S.B.	Ordinis Sancti Benedicti.
P.S.R.I.	Princeps Sacri Romani Imperii.
R.	Robertus, Rolandus, Ricardus.
R.P.D.	Reverendissime Pater Domine.
S.	Symon, Samuel, Siwardus.
S.C.M.	Sacra Cæsarea Majestas.
S.D.	Salutem Dicit.
S.D.N.R.	Supremus Dominus Noster Rex.
S.M.E.	Sancta Mater Ecclesia.
S.P.	Sacri Palatii.
S.R.E.	Sacra Romana Ecclesia.
S.V.	Sanctitas Vestra.
T.	Thomas, Turgodus, Thoraldus.
V.R.P.	Vestra Reverendissima Paternitas.
V.S.	Vestræ Sanctitatis.
W.	Willelmus, Walterus, Wido.

Doubling an initial, shows that it is to be taken in the plural sense, as PP. for Papæ, TT. for Tituli, MSS. for Manuscripts.

C. Corrupted.—The Anglo-Saxon p, denoting *th*, has been corrupted into *y*; whence y^e is put for *the*, y^r for *their*, y^n for *then*. In Scotland, the numerals j^m vj^c, that is, 1600, have been corrupted into the unmeaning word jaj, or jajc.

C. Exemplified.—A sentence of the famous Declaration of Scottish Independence of 1320 is here given, with the contractions of the original (now in the Register House at Edinburgh); the same sentence with the contracted words written at length being placed by its side.

Original.	Contracted words at length.
Quia q^adiu Centū viui remanserint / nūcq^a Angto$\mathcal{Y}$ dñio aliq^{a}ten^9 volum^9 subiugari / Non eni ppt' gtiam / diuicias aut honores pugnam^9 / set ppt' libtatem solūmodo / q^am nemo bon^9 / n^i simul cū vita amttit.	Quia quamdiu Centum viui remanserint, nunequam Anglorum domino aliquatenus volumus subiugari: non enim propter gloriam, diuicias, aut honores pugnamus, set propter libertatem solummodo, quam nemo bonus nisi simul cum vita amittit.

That is, 'So long as a hundred of us remain in life, we will never be brought under the dominion of the English; for it is not for glory, or riches, or honors that we fight, but for freedom alone, which no good man will part with, except with his life.'

Collections of C. have been engraved in *fac-simile* in several works, among which may be enumerated Baring's *Clavis Diplomatica*, Hanov. 1737 and 1784; Anderson's *Diplomata Scotiæ*, Edin. 1739; Walther's *Lexicon Diplomaticum*, Gotting. 1745; the *Nouveau Traité de Diplomatique*, Paris, 1750—1765, one of the many noble works of the Benedictines of St. Maur; Lemoine's *Diplomatique Pratique*, Metz, 1765; Trombelli's *L'Arte di conoscere leta de' codici Latini ed Italiani*, Bologn. 1756 and 1778; M. Nat. de Wailly's *Eléments de Paléographie*, Paris, 1838; M. L. Alph. Chassant's *Paléographie*, Paris, 1839 and 1854, and his *Dictionnaire des Abréviations*, Evreux, 1846.

CONTRA'VENTION, in the law of Scotland, any act done in violation of a legal condition or obligation. The term is most frequently applied: 1. To an act done by an heir of entail, in opposition to the provisions of the deed; 2. To an act of violence or molestation, in opposition to Lawburrows (q. v.). Stair, i. 9, s. 30, and iv. 48.

CONTRAYE'RVA, a medicine once in much repute against low fevers, and as a mild stimulant and diaphoretic, and still used in some countries, although not much in Britain, consists of the root-stocks (rhizomes) of different species of *Dorstenia*, a tropical American plant of the natural order *Moraceæ*. The genus is remarkable for the plane receptacle in which the numerous small flowers are fixed, the male flowers in superficial depressions, the female flowers in deep sockets. The flowers have neither calyx nor corolla. The fruit consists of *achenia*, imbedded in the fleshy receptacle from which they are projected by elastic force when ripe. *D. Contrayerva* is a perennial plant, with palmate leaves, and somewhat quadrangular receptacles. Its root-stock is knotty, 1—2 inches long, about half an inch thick, reddish-brown, pale within, sending out on all sides many slender fibres (roots), which are generally loaded with small brown knots. It has a peculiar aromatic, overpowering smell, and a somewhat astringent, warm, bitterish taste. It keeps badly. It contains so much mucilage that a decoction of it will not pass through a filter.—*D. Brasiliensis*, a stemless species, with oblong, heart-shaped leaves and a circular receptacle, a native of the West Indies and Brazil, possesses similar properties, but is said to be more energetic, and furnishes the C. of British commerce. Other species possess similar properties. They have also been represented as efficacious against serpent-bites, and hence the name C., a *counter-poison*.

CON'TUMACY, a Scotch law-term, in one sense, equivalent to non-appearance in England (see DECREE IN ABSENCE; DEFAULT); but sometimes used in the wider sense of disobedience to a judicial order. In a criminal process, C. is punished by a sentence of fugitation; in a civil process, its only consequence is that the case will be proceeded with, and decree pronounced against the contumacious defender.

CONVALESCENT HOSPITALS are institutions of the greatest importance. Many patients die on returning to their own unhealthy homes from our ordinary hospitals; the convalescent home or hospital supplies a valuable stage in the process of cure. Either a series of detached cottages, or one large and well-appointed house, may serve to secure pure air and wholesome treatment. Of the latter kind, one of the first and best models was the magnificent establishment at Vincennes, founded in 1857. It contains more than 400 beds; permits an average stay of from twenty to thirty days; and in three years received 14,000 convalescent artisans.

CONVALLA'RIA. See LILLY OF THE VALLEY.

CONVENT. See MONASTERY.

CONVECTION. See HEAT.

CONVE'NTICLE (Lat. *conventiculum*, a diminutive of *conventus*) originally meant a cabal among the monks of a monastery, formed to secure the election of a favorite as abbot. The word consequently fell into disrepute. It was first given as an appellation of reproach to the assemblies of Wickliffe's followers, and was afterwards applied to the meetings of the English and Scottish noncomformists. Severe statutes were often passed for the suppression of these conventicles. See ACT OF TOLERATION, TEST ACTS.

CONVENTION. See NATIONAL CONVENTION.

CONVENTION OF ROYAL BURGHS, in Scotland. The burgh system of Scotland is very ancient (see BURGH), but it was by stat. 1487, c. 111, that the royal burghs of Scotland were first ordered to hold an annual meeting by commissioners, at what is now the unimportant town of Inverkeithing, where 'the welfare of merchandize, the gude rule and statutes for the common profit of burrows,' should be discussed, 'and which should provide for remeid upon the skaith and injuries sustained within the burrows.' This convention is conjectured by Mr. Burton to have taken the place of the more ancient 'court of the four burghs'—Edinburgh, Sterling, Berwick, and Roxburgh. The powers conferred by this act, which were renewed by later statutes, are still in force, and in virtue of them the C. of R. B. meets annually in Edinburgh on the second Tuesday of July. This court had a partial jurisdiction in questions as to the general regulation of trade, along with legislative authority over the constitutions of the burghs, which, previously to the passing of the Burgh Reform Act, included a right to adjust their 'Setts' (q. v.). Its operations are now almost entirely limited to discussing measures connected with trade, for which it may be proposed to apply to parliament. In this respect, it acts in the character of something like a general chamber of commerce (q. v.).

CONVENTION PARLIAMENT. It is a branch of the royal prerogative, that no parliament shall be convened by its own authority, or by any other authority than that of the sovereign. Where the crown is in abeyance, this prerogative cannot of course be exercised, and the expedient of Convention Parliaments has been resorted to, the enactments of which shall afterwards be ratified by a parliament summoned in accordance with the provisions of the constitution. The C. P. which restored Charles II. to the throne met above a month before his return, and was afterwards declared to be a good parliament, notwithstanding the defect of the king's writs (13 Car. II. c. 7 and c. 14). In like manner, at the revolution of 1688, the Lords and Commons, on the summons of the Prince of Orange, met in Convention, and disposed of the crown and kingdom, and this convention was subsequently declared (1 Will. and Mary, st. 1, c. 1) to be really the two Houses of Parliament, notwithstanding the want of writs and other defects of form. Under the name of CONVENTION, there also took place a meeting of the Estates of Scotland, called by the Prince of Orange on the same occasion. The meeting commenced on the 14th of March 1689, and was turned into a parliament on the 5th of June thereafter. The principal act of the Convention was to settle the Scottish crown upon William and Mary. After these precedents, we are perhaps almost entitled to regard the meeting of a C. P. as the constitutional mode in which the general

will of England expresses itself on such questions as cannot be constitutionally discussed in parliament—e. g., a change of the reigning dynasty.

CONVE'NTIONAL, in Art, is that which is in accordance, not with the absolute principles of beauty in form and color, but with the opinions and sentiments with reference to forms and colors, which chance to prevail at a particular time, in a particular country, or social class. Conventionality in art holds the same relation to the beautiful that conventionality in morals does to the good, or a speculative opinion to the true.

CONVERGING, or CONVERGENT, is applied, in Geometry, to straight lines that meet or tend to meet in a point; looked at in a direction from the point, they are *divergent*, or separating. C. and divergent are often used in reference to rays of light. See CATOPTRICS. In Algebra, the term convergent is applied, in a loose way, to any infinite series the terms of which go on diminishing; while a series is called divergent when its terms continually increase. Strictly, however, a C. series is one whose terms diminish in such a way that no number of them added together will be as great as a certain given number. Thus, however far we extend the series, $1+\frac{1}{2}+\frac{1}{4}+\frac{1}{8}$, &c., the sum will never amount to 2, though always approaching nearer to it. But the series, $1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+$ &c., has no such limit, and is therefore not convergent in this sense.

CONVERSA'NO, a town of South Italy, in the province of Bari, about 19 miles south-east of the city of that name. It is pleasantly situated on a hill in a fertile wine, oil, almond, and cotton producing district. It has a cathedral and several convents. Pop. about 10,500.

CO'NVERSE AND CONVE'RSION are terms in Logic, signifying that one proposition is formed from another by interchanging the subject and predicate: as 'Every A is B;' the C. of which is, 'Every B is A.' This example is termed a case of *simple* conversion; besides which, however, logicians recognize two other kinds of conversion—viz., *limited* conversion, and conversion by *contra-position*. The former may be exemplified thus: 'Every A is B;' the limited C. of which is, '*Some* Bs are As;' and the latter thus: 'Some A is not B;' which, converted by contraposition, is, 'Something that is not B is A;' 'Some men are not wise; some beings that are not wise are men.' Of these logical converses, the second and third are *necessarily* true, but not the first. When we say, 'Every A is B,' the reader might at first sight conclude that 'Every B is A' also; but if, instead of these letters, to which he probably attaches no meaning, he employ terms denoting objects with which he is familiar, he will see that a simple C. may be very far from the truth. Thus, 'Every penny is a coin,' has for its simple C. 'Every coin is a penny.' The reason why a simple C. is not necessarily true is, that in such a proposition as 'Every A is B,' the subject 'A' is—to speak logically—universally distributed, whereas the predicate 'B' is not. If it were, the proposition would read as follows: 'Every A is *every* B;' the simple C. of which, 'Every B. is every A,' would be true.

CO'NVEX. See CONCAVE.

CONVEY'ANCE, in Law, is the deed or writing by which property is conveyed or transferred from one person to another. The term, though strictly applicable, is not generally applied to the act of transferring personal, or, as it is called in Scotland, movable property. As regards real or heritable property, the more special nature of a C., and the consequent duties of the conveyancer, in so far as they fall within the scope of this work, will be explained under separate heads. See, for England, FEE, FREEHOLD, COPYHOLD, LEASEHOLD, MORTGAGE, CHATTELS, BILL OF SALE, ASSIGNMENT, FEOFFMENT, DEED, COMMON FORMS, GRANT, TRUST, SETTLEMENT, USAGES, &c.; and for Scotland, FEU, SUPERIOR, VASSAL, WARD-HOLDING, MORTIFICATION, BLANCH-HOLDING, BURGAGE-HOLDING, CHARTER, SASINE, DISPOSITION. A statement of the general nature of a C., and of the feudal system, with which the conveyancing of many of the countries of Europe is still so intimately connected, will be given under CONVEYANCING.

CONVEY'ANCER is a person who practises the art of preparing the deeds or writings used for the conveyance or transference of property from one person to another. Conveyancers in England are generally barristers, who in most instances belong to the Equity bar. There is also a special class of practitioners, known by the name of conveyancers, who are members of the Inns of Court, though not called to the bar. These must take out an annual certificate. But although most deeds respecting real estate are drawn by conveyancers, they are also the ordinary work of an attorney or solicitor, and may be drawn indeed by any party if he chooses to take the risk.

CONVEY'ANCING is the art of preparing the deeds or instruments used for the transference of property from one person to another. Such writings form the title or evidence of the right of the person possessing or claiming possession of property; and it is of the greatest importance that the conveyancer employed to prepare them, should be possessed of a competent knowledge of the law as applicable to such deeds, and have the skill required to frame them in such a form as clearly to express and attain the object intended. In the earliest stage of society, there was no call for the profession of a conveyancer; property was held in right of occupancy, without any written title, and was also conveyed from one to another without writing, the new owner being usually put in possession in presence of witnesses called for the purpose, by some symbolical form, such as the delivery of earth and stone to represent the land, a wand to represent wood, grass and corn to represent tithes, and other appropriate symbols to represent mills, fishings, or other kinds of property.

In the earlier period of the history of the Jews, the symbolical mode of changing the ownership of property was curious. 'Now this was the manner in *former time* in Israel concerning redeeming and concerning changing, for to confirm all things: a man plucked off his shoe and gave it to his neighbor: and this was a testimony in Israel' (Ruth iv. 7). In later times, the Jews appear to have had a much more artistic system of C., making use of all the safeguards that are used in modern times—viz., writing, witnesses, subscribing, sealing, and recording the documents. There is a very distinct account of a Jewish conveyance in the later period in Jeremiah xxxii. 9—12, 'And I bought the field of Hanameel, and weighed him the money. And I subscribed the evidence, and sealed it, and took witnesses. So I took the evidence of the purchase, both that which was sealed according to the law and custom, and that which was open: and I gave the evidence of the purchase unto Baruch, in the sight of Hanameel [the seller], and in the presence of the witnesses that subscribed the book of the purchase, before all the Jews that sat in the court of the prison.'

The Romans made no distinction in principle between real and personal or movable and immovable property, in their conveyancing. Each kind of property was held free of any superior. Their deeds were therefore simple, not requiring any reservation or declaration of the superior's rights. They had public registers in which conveyances were recorded. After the invasion of the southern by the northern nations, the feudal system spread over nearly the whole of Europe, and C. was regulated in accordance with it; the rights of the superior and the rights of the vassal or proprietor being carefully distinguished. The Leges Barbarorum, contained in the Burgundian Code, and the Code of the Longobardi, embody the older feudal uses, from which the modern are derived. In the 7th c., a work of peculiar interest to the conveyancer was compiled by Marculfus, a monk, containing the germs of modern conveyancing. It is in substance a book of styles or forms of deeds, partly Roman and partly feudal. The genius of the system of land-rights derived from the barbarians was to concentrate the property of land, for the sake of individual power; while the Roman laws and customs tended in the opposite direction, for they treated land in regard to succession like movables, as the French now do, dividing it among the whole members of a family. Alienation by sale or gift was freely permitted, a power long denied by the feudal rules. Indeed, feus or grants were originally revocable by the superior, and did not become hereditary till the time of Charlemagne.

Among the ancient Goths and Swedes, the conveyance of land was made in the presence of witnesses, who extended the cloak of the buyer, while the seller threw a clod of the land into it, as a symbol of the transference of possession. Among the Saxons, the delivery of a turf by the seller to the buyer was necessary. Written titles were, however, introduced at an early period, and at first were short and simple in form, but increased in length and complexity as civilization advanced, containing various conditions, provisions, and limitations, so that the art of the conveyancer became both a difficult and laborious one. He had not only to prepare the appropriate form of conveyance, but to examine the prior writings forming the title to the property, in order to judge whether they were in proper form and valid. As a general rule, a written title is now essential to the possession of real property in civilized communities; and if there is no written title, the property falls to the crown or state. In the Roman empire, extending over the greater part of Europe, the system of land-rights was allodial—that is, the lands were held independent of any superior. After the irruption of the northern nations into Italy, the feudal system was introduced, by which the proprietor has only a limited right under a superior. The introduction of the feudal system tended to complicate written titles to land very much, as not only had the rights of the grantee or vassal to be expressed and defined, but those of the granter as overlord or superior, also. In the present century, again, the tendency is towards simplicity; and in France, the feudal system has been superseded by the Code Napoleon.

In Great Britain and other countries still retaining the feudal system, the forms of C. have been much shortened and simplified. While the feudal system, on the one hand, increased the com-

plexity of C., it ought not to be forgotten that, on the other hand, it greatly lessened the number of conveyances. Under the Roman law, real property descended equally to all the heirs of a deceased proprietor, each heir requiring a written title to his own share; while the genius of the feudal law was to concentrate property in the heads of families, and the eldest son inherited the whole real estate of his ancestor; and alienation, by gift or sale, was long denied to feudal proprietors. Improvement in the science of law occasions improvement in conveyancing. Under the Roman empire, the art of C. had attained to much precision in the hands of the imperial notaries. After the fall of the empire, C. fell into the hands of ecclesiastical notaries; by them it was communicated to the conveyancers of the church, who performed the duties of the conveyancer for some centuries, till after the revival of letters, when the art again passed to laymen.

The feudal system does not seem to have been generally introduced into Great Britain till after the Conquest, though traces of it are to be found earlier. The inherent character of the feudal tenure is a grant of land made voluntarily by a king or leader, on the condition of the fidelity of the grantee and military service. While, on the one hand, the superior was a protector to the vassal in time of trouble; on the other hand, the vassal was exposed to the cupidity and rapacity of the superior, whose right to casualties or feudal incidents enabled him to oppress his vassals. The nature of these casualties or incidents will be explained under FINE, QUIT-RENT, HERIOT, COPYHOLD, ESCHEAT, WARDSHIP, MARRIAGE. One of the most curious of these incidents was that last mentioned. A male heir required the consent of his superior, and large fines were exacted for the consent. In the time of Charles I., the Earl of Warwick exacted £10,000—equal to a much larger sum now—for his consent to a lady-vassal marrying a husband in every respect suitable.

So long as feudal forms are retained, C. must be complex and expensive. Public opinion has latterly tended unmistakably towards a thorough abolition of the complex and expensive deeds required in the sale and mortgage of land; and the legislature has of late years done much towards this reform. Movable property is usually conveyed by delivery, but there are exceptions; thus, if it has been part of the bargain that the sale has to be completed by writing, the contract must be reduced to writing; and by statute, ships must be conveyed by writing. An Act for simplifying and improving the practice of conveyancing (44 and 45 Vict. c. 41) was passed in 1881.

CO'NVICT (from the Latin) means a person convicted of any criminal charge. The term came by custom to be applied to persons subject to punishment for the more serious class of offences, and of late its meaning has become almost entirely restricted to the class of criminals who used to be transported to the distant colonies of Britain. These criminals are now condemned to penal servitude for longer or shorter periods, and are usually spoken of as convicts under penal discipline, while offenders sentenced to short periods of detention in the ordinary jails are called prisoners. The convicts are confined in special C. establishments in different parts of the United Kingdom. The earlier history of the treatment of these criminals will be found under the head TRANSPORTATION. In the year 1840, the system of transportation to the chief penal colony, New South Wales, was suspended. Grave doubts had become prevalent as to the efficiency of the system, and all questions created by these doubts were solved by the refusal of the colonies to receive convicts, and the impossibility of disposing of them abroad, except in trifling numbers to the small districts of Western Australia. It was thus necessary to solve the question, how these convicts could be treated at home in a manner consistent with the objects of punishment—the protection of the community, and the reformation of the offender to the extent to which that is practicable. Before this necessity occurred, considerable progress had been made in prison-discipline by arrangements which, without subjecting criminals to absolute silence or absolute solitude, separated them from the contaminating society of each other. It was naturally supposed that a system found beneficial for ordinary prisoners would suit convicts. But it was discovered that the discipline beneficially applied during a short period of imprisonment, could not be endured for a long period without physical and mental deterioration; and that the depression and anxiety created by their long sentences—sometimes for twenty years, and sometimes for life—made convicts break down under it within the period for which it could be quite easily endured by ordinary prisoners.

It is a fixed principle of prison-discipline, that while punishment may be made to any extent disagreeable, it is never to be permitted, if possible, to injure either the body or the mind. It was found unsafe to subject male convicts to separate imprisonment for more than eight months; females, owing to some constitutional difference, are found to bear it without detriment for four months longer. At the end of eight months, then, or a year, as the case may be, the C. is gradually, so far as is consistent with safe custody, brought back into the habits of the freer population. It is usual to call the early stage of their discipline the probationary, and the later the reformatory. In the latter, they are associated under precautions and careful inspection, and are occupied in trades in which they may make their bread when free. Public works, such as the breakwater, quarries, and fortress at Portland, and the works at Chatham and Portsmouth, afford a valuable outlet for C. labor. In such establishments may be seen a thousand men or more, with hammers, mattocks, axes, and all descriptions of formidable tools, working under the eye of their warders as quietly and systematically as ordinary laborers. There are establishments where, as far as possible, the same system is administered to females—as at Woking and the general prison for Scotland at Perth. The great hold by which the convicts are kept in order, is the system popularly called 'the mark system,' under which, by steady application to work, convicts earn a remission of part of their sentence. Conduct is not taken into account in assigning these marks, but on the occasion of any specific misconduct a proportion of earned and registered marks is forfeited. The present C. establishments of the United Kingdom are: In England—Dartmoor, in which the great proportion are invalids; Portland, Portsmouth, Chatham, and Borstal, for males, in each of which there are public works; Pentonville, Parkhurst, Wormwood Scrubs, and Brixton, for males; Woking and Millbank for males and females; and Fulham, for females. In Scotland, the C. department of the general prison at Perth is occupied by a limited number of males for the first nine months of their sentence (after which they go to public works prisons in England), and by females for the whole period. In Ireland—Spike Island (with Forts Camden and Carlyle) and Lusk for males; and Mountjoy for males and females. The number of convicts in England on 31st March 1880 was—males, 9239; females, 1139: Scotland (1881), males, 31; females, 179: Ireland (1879), males, 750; females, 179.

CONVOCA'TIONS (from Lat. *convocare*, to call together) were originally synods of the clergy or the ancient ecclesiastical councils of the archbishop, but became incorporated into the English constitution of church and state, and endued with certain parliamentary privileges. Some writers distinguish between councils and C.—the former as being for spiritual purposes, and summoned without authority from the crown; the latter as being for civil purposes, and by command of the crown. The two, however, in process of time, especially after the Conquest, became gradually blended; C. made canons, and councils granted subsidies, and all distinction had disappeared before the Reformation. The circumstances attending the famous assembly at Northampton, 1282, in the reign of Edward I., helped to settle the form which C. have since assumed. In England, the provinces of Canterbury and York have each their convocation. Previous to the Reformation, these were sometimes convened into a *National* Synod; but since then, matters have usually been concluded in the C. of Canterbury, and transmitted to York for concurrence. A convocation consists of three elements—1. The archbishop; 2. The bishops; 3. The clergy of the second order. They originally met in one assembly, but since the beginning of the 14th c. the clergy in the province of Canterbury have retired into a distinct chamber, presided over by a *prolocutor*, with officers and journals of their own. These two bodies are called the Upper and Lower Houses. In the Convocation of York the same distinction exists, but on the rare occasions of their meeting, the business has been generally conducted in one assembly. The archbishop has the sole power of summoning, presiding, and proroguing; he has also a veto upon all measures. He cannot, however, summon without authority from the crown. The Upper House is the proper *locus synodi*, where the bishops have a right to sit and vote, and before the Reformation the mitred abbots had place there also. The Lower House consists of the lesser dignitaries, as deans and archdeacons, and the proctors sent by capitular bodies and by the parochial clergy. In Canterbury, the beneficed clergy only elect, and they send one proctor for each diocese; in York, all the clergy elect, and send one proctor for each archdeaconry. The Lower House deliberates on matters proposed by the archbishop; it may present petitions to the Upper House and state grievances, be with it in judicature on persons convened, and dissent from and so hinder the passing of any synodical act.

The passing of subsidies in convocation ceased in 1665, and the records were destroyed in the fire of London in the following year. Meetings of convocation fell into abeyance from the political troubles caused by the Revolution of 1688. They have been revived with considerable advantage to the church, but their action has been and is greatly restricted. In Ireland, the C. of the four provinces assembled at Dublin, all together, and were on the model of those in England. From the Union downwards, the Irish C. never assembled. Since the disestablishment, the legislative assembly of the Protestant Episcopal Church is called the General Synod. An act of parliament was passed in 1663, for

regulating the meetings of convocation in Scotland; but shortly after the Revolution of 1688, the Episcopal Church ceased to be the national church; and ever since, the meetings of the Presbyterian Church, embracing clergy and laity, have been called General Assemblies. See ASSEMBLY, SYNOD.

The position of the church of England as respects its C. is exceedingly anomalous, but is incidental to certain circumstances in the constitution and polity of the country. As essentially interwoven with the state, the church possesses no independent action; its articles, liturgy, organization as to benefices, &c., are all regulated by parliament; while its discipline falls within the scope of the ecclesiastical courts, a class of tribunals apart from the ministering clergy. The church, therefore, in its capacity as an institution to teach certain doctrines of religion, is left little to do in the way of jurisdiction. It is further urged, as a reason for restricting the power of Convocation, that being purely sacerdotal, it might be apt to run into excesses, and put forth claims adverse to the prevailing tone of sentiment on religious matters; that, in short, as things stand, it is safer for the public to be under the authority of parliament than to be subject to the ordinances of a body of ecclesiastics. At the same time, it is generally allowed that some kind of reform is desirable, though how this should be effected in a manner satisfactory to all parties, it would be difficult to say. The convocations of Canterbury and York assemble annually at the opening of parliament, each keeping up its own distinctive customs. See Trevor's *Convocations of the Two Provinces*, Cardwell's *Synodalia* and *Documentary Annals;* Lathbury's *History of the Convocation of the Church of England.*

Convolvulus: *a*, part of stem with leaves and flower; *b*, a flower-stalk and flower, the corolla and stamens removed.

CONVO'LVULUS, (Lat. *convolvo*, to twine together), a genus of plants, the type of the exogenous natural order CONVOLVULACEÆ. This order contains nearly 700 known species, herbaceous and shrubby; generally with a twining stem and milky juice; large and beautiful flowers; a 5-partite calyx; a monopetalous corolla, with regular 5-lobed and plaited limb; five stamens, the ovary free, with 1—4 cells and few ovules; the fruit a capsule, sometimes succulent.

The plants of this order are very abundant in the tropics, but comparatively rare in cold climates. Many are cultivated as ornamental plants, particularly species of *Convolvulus* and *Ipomœa*. The acrid milky juice is often strongly purgative; and jalap and scammony are products of this order. Some species, however, have large farinaceous roots, capable of being used as food, of which the Batatas (q. v.), or Sweet Potato, is the most important. A few are natives of Britain, and are known by the name of BINDWEED. *C. arvensis* is a troublesome weed in some sandy soils in England, and *Calystegia sepium* in richer soils. The former has rose-colored fragrant flowers, the latter large white flowers. Both are ornamental; the latter is now often planted to cover posts and trellises. *C. scammonia* yields scammony, and the root of *C. panduratus* is used as a purgative in the United States. *C. scoparius*, a shrubby species, native of the Canary Isles, yields one of the kinds of wood called Rosewood, which has a strong smell of roses.

CO'NVOY (Fr. *convoi*) is the name given to one or more ships of war appointed to protect a fleet of merchant-vessels against the attacks of an enemy or of pirates. If a merchant-ship part company with the C., or neglect to obey the signals, all claims of insurance are forfeited. The name is sometimes applied to the merchant-vessels so escorted. In the military service, a C. is, properly speaking, a train of wagons laden with provisions or warlike stores; the term, however, is applied also to the detachment of troops, or escort, appointed to protect such train.

CONVU'LSIONARIES, the name given to a fanatical sect of Jansenists who sprang up in France about 1730. Their meeting-place was the churchyard of St. Medardus, in a suburb of Paris, where was the tomb of a certain Francis of Paris, who died in 1727, and was reckoned very holy by the Jansenists on account of his extravagant asceticism. At this tomb a multitude of people poured forth fanatical prayers, preachments, and prophesyings. Miracles are also alleged to have been performed, for proof of which we are referred to a work written by M. Montgeron, a French senator, and entitled *La Verité des Miracles opérés par l'intercession de François de Paris* (Paris, 1737). After 1731, the fanaticism of the C. increased to utter madness. 'They threw themselves into the most violent contortions of body, rolled about on the ground, imitated birds, beasts, and fishes, and at last, when they had completely spent themselves, went off in a swoon.' In 1733, the king issued an order for the imprisonment of these fanatics, but it was found impossible to put a complete stop to the mischief. They took to predicting the downfall of the throne and the church, which prophecy the French Revolution appeared to fulfil. They were not much heard of in Paris after the middle of last century, but have occurred in country-places at various times within the present century. They brought Jansenism into so much disrepute, that Voltaire declared the tomb of Francis to be the grave of Jansenism.

CONVU'LSIONS, a form of disease very frequently affecting infancy, in which the body is thrown into violent spasmodic contractions, the sensibility and voluntary motion being for a time suspended. A fit of C. may last from a few minutes to some hours, and may readily prove fatal, if not relieved within a short period. The first symptom observed is often a twitching of particular muscles or groups of muscles, and a change in the habitual expression or color of the face, with distension of the features, and turning of the globes of the eyes suddenly upwards. The fingers are sometimes clenched in the palm, and the feet turned inwards; sometimes, however, C. occur absolutely without warnings of this kind, and even in the midst of perfect apparent health. Their cause is usually to be found in some source of irritation, capable of producing fever if long continued; as, for instance, disordered dentition, worms in the intestine, hooping-cough, &c. Most epidemic fevers are also apt to be attended, in children, by C. in their early stages; and diseases of the brain and its membranes at every stage of their progress. C. are greatly promoted by bad ventilation and injudicious feeding, with deficient exercise; and a great part of the cure consists in discovering and removing the causes of the disease.

When a child is suddenly seized with C., or with a tendency to spasm, such as twitching of the features, or contractions of the fingers and toes, it should be placed at once in a very free current of air, with its feet towards the fire; the extremities should be kept warm, and a cold lotion may be applied to the head, especially if there is much flushing of the face; a little castor oil may be given if the bowels are confined; and if there is flatulence, the belly may be rubbed with a warm hand, or with some simple stimulating liniment, such as camphorated oil. Not much more can be done without medical assistance; but in the event of the case being very serious, and medical aid at a great distance, it might perhaps be right to cause the child to inhale a little chloroform, great care being taken that plenty of air is also admitted to the lungs. The strictly medical treatment commonly consists in the administration of medicines adapted to the state of the bowels, with the application of cold to the head, and sometimes the inhalation of chloroform. Leeches and bleeding are very rarely useful, though too often employed.

C. are rare amongst horses and cattle. In young dogs, however, they frequently occur from intestinal worms, disordered digestion, or in connection with distemper or other debilitating diseases: they usually disappear when their special causes are removed.

CO'NWAY, or ABERCO'NWAY, a seaport town of Caernarvonshire, North Wales, on the estuary of the Conway, here crossed by a fine tubular, and a suspension bridge, 22 miles north-east of Caernarvon. The town, which is triangular in form, is beautifully situated on a steep slope on the left bank of the Conway, and is surrounded by walls 12 feet thick, with towers and battlements. The principal streets are well proportioned and regular, and contain several ancient houses. C. Castle, one of the noblest castellated structures in Britain, stands on a precipice overlooking the river. It was first built by Hugh Lupus, Earl of Chester, and rebuilt in 1283 by Edward I., to check the Welsh. Its walls are 12 to 15 feet thick, with eight vast towers, four of which are each surmounted by a slender turret. In 1646, the parliamentary forces took the castle, but did not injure it; but after the Restoration it was dismantled by the Earl of Conway. The Plâs Mawr, 'Great Mansion,' is a noble pile erected in 1585, in the Elizabethan style, with the exterior and interior profusely ornamented with figures, coats of arms, scrolls, &c. The harbor is dry at low water. Conway was an opulent town until the great plague in 1607 almost depopulated it. A Cistercian abbey was founded here by Llywelyn ab Jorwerth, prince of North Wales. Llywelyn the Great, and several other princes and illustrious persons, were buried in it. The Castle Hotel occupies its site. Pop. (1881) 3179. C. (a chartered borough since 1876) unites with Caernarvon, Bangor, Criccieth, Nevin, and Pwllheli in returning one member to parliament.

CONWAY, a river in North Wales, 30 miles long—one of the most noted in Wales for the bold romantic scenery along its higher, as well as the rich beautiful scenery along its lower course. It rises in a small mountain-lake where the three counties, Merioneth, Denbigh, and Caernarvon meet, and runs north-west, north-east, and north, past Llanrwst, Trefrhiw, and Con-

way, to Beaumaris Bay in the Irish Sea. It receives many rapid mountain-streams. In the lower 12 miles of its course it is a large, winding, smooth stream, up which the tide flows, and is navigable for vessels of 100 tons. At Conway it is half a mile broad at spring-tides, which rise here 21 to 24 feet. The C. has been famous for its pearls since Roman times.

CONY, an old English name for the rabbit, but employed in the authorized and other versions of the Bible as the translation of

Daman or Ashkoko. The Cony of the Bible.

a Hebrew word which certainly does not designate the rabbit. The C. of the Old Testament is with the greatest probability supposed to be the Daman (q. v.) or ashkoko.

CONY'ZA, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, of which one species, *C. squarrosa* (also known as *Inula conyza*), is of frequent occurrence in England and throughout great part of Europe. It has a stem two or three feet high, downy ovato-lanceolate leaves, and yellow flowers. It receives the English name Fleabane and Ploughman's Spikenard, and has a strong peculiar smell, which is said to drive away fleas and gnats. In most of the languages of Europe, it bears names referring to this property.

COOK, CAPTAIN JAMES, one of the most eminent among England's celebrated navigators, was born October 27, 1728, at Marton, in Yorkshire, where his father was an agricultural laborer. At first apprenticed to a haberdasher, he afterwards went to sea, and having spent some years in coasting-vessels, entered the royal navy, in which he soon rose to the rank of master. The charts and observations which he drew up as marine-surveyor of the coasts of Newfoundland and Labrador, introduced him to the notice of the Royal Society, who offered him the command of an expedition to the Pacific Ocean, to make an observation of the transit of Venus over the face of the sun. The voyage being one to his taste, C. immediately accepted the offer, and set sail from Plymouth on the 26th of August 1768 in the *Endeavour*, a small ship of 370 tons. The expedition arrived at Tahiti (or Otaheite, as he named it) on the 13th April of the following year; and the transit was witnessed in a most satisfactory manner on the 3d June. Leaving Tahiti on the 13th July, C. visited New Zealand, which had not been touched at by Europeans for a century and a quarter; and after exploring the coast for six months, sailed westward, reaching (on the 19th April 1770) New Holland, now Australia, which he called New South Wales, and took possession of in the name of Great Britain. Having explored a large portion of the coast, he steered for New Guinea, passing between Australia and that island, and thus proving, what had heretofore been doubted, that the two were distinct islands. Continuing his voyage by Java, Batavia, and the Cape of Good Hope, C. anchored in the Downs on 12th June 1771. This voyage, besides vastly increasing geographical knowledge—one of the most important results in this respect being, that it proved that neither Australia nor New Zealand belonged to the southern continent at this time supposed to exist, and that to the northward of lat. 40° S. no continent could exist—also added not a little to the sciences of botany and astronomy. A second voyage, for the discovery of what was then called the *Terra Australis Incognita*, which was now believed to lie in higher latitudes than had hitherto been explored, was undertaken by C. in the year of his return; and the expedition, consisting of two ships—the *Resolution* and the *Adventure*—sailed from Plymouth on the 13th July 1772.

It would be out of the scope of this article to follow Captain C. through his three years' navigation of the Pacific and Southern Oceans, in the course of which time he sailed upwards of 20,000 leagues. It can only be stated generally, that his voyage proved the non-existence of land of any extent between the 50th and 70th parallels. C. arrived in England again on the 30th July 1775. So admirable had been his arrangements for the health of his crew, that during the whole voyage he lost only one man by sickness; and so skilful his seamanship, that not a spar of any consequence was lost. C. wrote an account of his second voyage himself. The belief in a practical North-west Passage, notwithstanding the failure of attempts extending over two centuries, still held possession of men's minds; and C. had no sooner returned from his second voyage, than he offered his services to the Admiralty, who had resolved on another effort for the discovery. They were gladly accepted, and C. determined to seek the passage by the way of Behring's Strait, instead of by Baffin's Bay and Davis' Strait, the routes formerly attempted. In his old ship, the *Resolution*, accompanied by Captain Clerke in the *Discovery*, C. sailed from Plymouth on the 12th July 1776. In this last voyage, C. met his death at the hands of savages, on the island of Hawaii, while endeavoring to recover a boat which had been stolen from the *Discovery*. This tragical event occurred on the 14th February 1779; not, however, before C. had made valuable additions to our geographical knowledge of the coasts of America and Asia, in the region of Behring's Strait. The news of his death occasioned deep and general regret in England. The king granted his widow a pension of £200, and each of his children £25; while the Royal Society did honor to his name, by having a gold medal struck in his commemoration. C. was one of England's greatest navigators. A practical and scientific seaman, he was also a sagacious, self-possessed commander, kind although strict to his crew, and marked by indomitable perseverance and ready decision.

COO'KERY. To prepare and soften food by the action of fire, and so to render it fit for digestion by the human stomach, has been a general custom from remote times; and more or less of skill in accomplishing this primary end has been displayed, according to the knowledge, wealth, and refinement possessed by each nation or people.

In ancient times, the occasion of a banquet appears chiefly to have arisen in a sacrifice to the gods, when a part of the victim was brought to the dwelling of the sacrificer, and was cooked for the feast. Birthdays, funerals, and victories were also celebrated in this manner. 'The Persians,' says Herodotus, 'were accustomed to honor, above all others, that day on which they were born, when the rich among them would sacrifice an ox, a horse, or a camel, which they roasted whole in ovens, while the poorer class gave only the smaller animals, as sheep. Yet the Persians were not great eaters of meat, but consumed much sweet food, and did not use salt.' The appendages to the higher order of banquets were most magnificent, so that in point of quantity and display they were very expensive.

Herodotus says on this head, 'that the Greeks who invited Xerxes to supper all came to the extremity of ruin; and that, wherever he took two meals, dining as well as supping, that city was utterly ruined.'

The Egyptians, it is said, were great bread-eaters. Though they possessed wheaten-flour of the finest sorts, they do not appear to have used it for their common bread, which was made of spelt, or of the center of the lotus dried and pounded. Fish they salted and dried in the sun; quails, ducks, and small birds they salted and ate raw. We read of their roasting and boiling the flesh of the ox. Large flocks of geese and of fowls were kept by them for the use of the table, hence their plan for the artificial hatching of eggs. 'Fish was used by all classes except the priests, but the staple food of the people consisted of vegetables, of which they had a large supply.' Herodotus mentions their making beer from barley, which they called *lythus*. We may still see the form in which their food came to table; ducks, loaves made round, and some biscuits and cakes, which have been taken from Egyptian tombs, are to be found in the British Museum. Apollonius, who wrote a treatise on the feasts of the Egyptians, says that they ate in a sitting posture, using the very simplest and most wholesome food.

There appears to have been considerable difference as to the manner in which good eating was appreciated in different parts of Greece. The Athenian meals are ridiculed by the comedians for their parsimony. After the Homeric age of simplicity, in which roast and boiled meat seems to have sufficed the kingly table, a diversity of preparation was obtained in cooking, and a certain epicureanism displayed in the quality, seasoning, and method of dressing food. The names of many authors of C. books are preserved in the writings of Athenæus; that of Archestratus, who is called the guide of Epicurus in his pleasures, and styled the inventor of made dishes, being the most renowned.

Fish was a principal article of food with all classes of Greeks; but with the wealthier, much skill and delicacy were used in cooking it, and choice and expensive sorts were sought after. Archestratus writes of 'a boiled torpedo done in oil and wine, and fragrant herbs, and some thin grated cheese.' Fish, stuffed with forcemeat and fried, boiled in pickle, baked in fig-leaves soaked in oil, cooked in hot ashes, &c., are among the recipes we find recorded. Large quantities of salt-fish were brought from the shores of the Euxine and the Hellespont; and this, with meal, cheese, and onions, was the chief food of the armies and navies when on service.

The Greeks boiled and roasted the flesh of sheep, pigs, lambs, and goats. They had poultry, small birds, and game, and sausages made of blood, partaking of the character of black-puddings. The bread made at Athens was the most celebrated; it

was sometimes household, but chiefly bought in the market, and was made in great variety, as pan-loaves, rolls, sweet loaves, &c. The bread eaten by the poorer classes was made of barley, and sometimes flavored with oil, honey, poppy-seed, &c. Athenian cheese-cakes were also famous; and they had honey and sesame-cakes, which, with fresh and dried fruits, as figs, almonds, olives, and nuts, seem to have been partaken of after dinner. They consumed vegetable food also in abundance, and had cabbage, onions, lettuce, and so on.

In the Greek house there was no regular cook, though in the establishments of the wealthy several females were kept, to attend to the kitchen. The women, in general, saw to the requirements of the table, and even the lady of the house was not idle. Cooks stood in the market at Athens, ready to be hired for particular occasions; the most celebrated were those of Sicily; they were probably persons of some importance.

'To roast some beef, to carve a joint with neatness,
To boil up sauces, and to blow the fire,
Is anybody's task; he who does this
Is but a seasoner and broth-maker;
A cook is quite another thing. His mind
Must comprehend all facts and circumstances:
Where is the place, and what the time of supper;
Who are the guests, and who the entertainer;
What fish he ought to buy, and where to buy it.'

Quoted by Athenæus from Dionysius, a comic poet.

In the early days of Rome, a gruel made of barley, and called *puls*, was the principal food of the people, and with green and other vegetables was, till later times, the usual fare of the inferior classes—meat being used but sparingly. By degrees, however, a taste for better eating crept in; and after the Asiatic conquests luxury was imported. Lucullus introduced habits of epicureanism after his return from Asia; the gourmand Apicius earned for himself a deathless name. The wealthy Romans cared for the elegant serving of their table, as well as for the quality of viands placed before them. With them, as with the Greeks, fish was a necessary as well as a luxury: they took much trouble to procure their oysters, and gave large sums for other fish. We read of a mullet of six pounds sold for 8000 sesterces (£70 16*s.* 8*d.*), and of the rhombus or turbot from Ravenna being held in high estimation.

They seem to have been as clever as the French in preparing *surprizes*, and in carrying out *disguises* in their dishes. The *pistor*, who made the bread and pastry, and the *structor*, who composed artificial figures of fruits or flesh, and who also arranged the dishes, seem to have shared the duties of the cook. We read of dainties, as ring-doves and fieldfares, hares, capons, ducks, peacocks, pheasants, and the livers of geese; also of such a formidable *pièce de résistance* as a 'huge boar, surrounded with sucking-pigs made in sweet paste, which were distributed among the guests.' The Romans prepared and cooked their food with oil to a great extent. Their meals probably consisted of two courses and a dessert, the first course being of materials intended to sharpen the appetite, and the second the 'brunt of war,' that is, a joint roasted or baked. The discovery or cultivation of vegetables, perhaps, gave rise to some proper names, as Lentulus, Fabius, &c. It is a Roman saying, that the number of persons at a repast should not be less than that of the Graces, nor more than that of the Muses. The Greeks and Romans used honey for the purposes for which we use sugar. The sugar-cane probably was cultivated in China, and its manufacture understood there; but the Greeks took it for a kind of concrete honey, and used it only for medicinal purposes.

Of ancient British C., nothing is known; it was probably of an extremely rude description. Hares, poultry, and fish are said to have been forbidden as food. We do not find much mention of the art of C. in the Saxon chronicles. The Danes and Germans appear to have been great drinkers, and to have paid little attention to the preparation of their eatables. The Normans were more curious in these matters; some offices among them were held in right of the kitchen. In early English C. much use was made of the mortar. Oil and lard were used instead of butter. Several English C. books bear an early date, as *The Forme of Cury*, by Mr. Pegge, 1390; and others date as follows: Sir J. Elliott's book, 1539; Abraham Veale's, 1575 *The Widdove's Treasure*, 1625.

The C. of France was probably of an imperfect and rude kind, till the introduction of Italian tastes by the princesses of the House of Medici. The ancient use of oil was modified by the discovery made by the French, of dressing meat in its own gravy. In our own day, there is no denying that the French cook is a true artist. We may, if we please, impute the trouble he takes with the dressing of his meat to the inferiority of the material, but this can be said of meat only; the preparation of vegetables and fruits is attended to with equal care, although, probably, the French have some of these things in greater perfection than ourselves.

The great difference between French and English C. consists in the fact, that they cook their meat much longer than we do. They consider that this renders it more digestible. They are thereby enabled to multiply dishes by altering or annihilating the original taste of the meat, and making it a vehicle for foreign flavors. The variety, daintiness, and grace of form which dishes thus acquire, is advantageously made use of by us, when we admit them at our repasts to mingle with our heavier and radically English joints. But, for ourselves, we desiderate the integrity of the form and flavor of our meats, considering that to be *over-cooking* which the French think only sufficient. In the point of economy, the French have a decided superiority over us. The French cook throws nothing away. Instead of going to the butcher for meat for stock, as our English cook does, he uses the trimmings for stock and glaze, and the skimmings of his boiled meats for purposes to which we apply butter or lard; and like a true workman, he produces great results from small means. This requires an education which few mistresses demand and few cooks obtain, but which, when achieved, justifies the expression of Voltaire:

Qu'un cuisinier est un mortel divin!

The estimation in which the services of a cook are held, may be known by the large salary attached to the office in great families, hotels, and club-houses. A visit to the kitchens of one of these establishments will teach us what a highly important post is that of *chef de cuisine*. There must be in such a person not only the necessary knowledge how things are to be done, but the power to arrange and direct the work of the numerous assistants, as to the exact part they must fulfil at each moment of their long and busy day. These places, indeed, are excellent schools for cooks, where they can undergo that severe training, without which a thorough practical knowledge of the business cannot be attained. It is indeed to be regretted—because a source of so much disappointment, discomfort, and waste—that a knowledge of plain C., at least, is not more desired by mistresses for themselves. That acquirement, and household management generally, are important enough to be made part of the education of all classes. The poorer would thereby be enabled both to lay out their money profitably, and to prepare their food so that it might satisfy and nourish them; and the heads of establishments in the upper classes would be more in a position to direct, appreciate, or, if necessary, condemn the performance of the cook. A cultivated and elegant taste is as much shown in the arrangement of viands as in the furnishing and decoration of the choicest boudoir.

The art of C., as a branch of female education, has latterly engaged considerable attention in England; and there are in London, Edinburgh, and other places, establishments where young ladies receive this kind of instruction. Recently, a school of cookery has been attached to the South Kensington Museum. Efforts are also made to teach C. to the humbler classes of girls, but much in this respect remains to be done.

For any shortcomings in cooking, however, the taste of the English is in some measure accountable. The universal practice of roasting large pieces of meat, which cannot be consumed while hot, causes no little waste, and is obstructive of improvement. The Scotch—who derive some part of their C., along with other usages, from the French—deal more in soup and boiled meat than the English, and their processes, while not less savory, are perhaps more economical.

So numerous are the books on C., that it would be out of our power to name even all the excellent ones. We can only say that Miss Acton's *Cookery Book*, Webster and Parkes' *Encyclopædia of Domestic Economy*, Mrs. Beeton's *Household Management*, Soyer's work, and Francatelli's are all good; *Meg Dods's Cookery* is also excellent. For cheapness and simplicity we may refer to Chambers's *Cookery for Young Housewives* (1*s.*). The two last mentioned embrace Scotch along with English cookery. See FOOD, BOILING, ROASTING, &c.

COOKERY, ARMY, is now becoming an important feature in the English military system. The sufferings in the Crimea in the winter of 1854—5 drew public attention to the subject; it was then found that C. was little understood by the British troops, and that the soldiers seldom had meat otherwise than boiled. M. Soyer was sent out by the government, principally to advise in reference to hospital C., but also to improve the system of camp-C., so far as military routine would allow. He devised new forms of stove, and constructed recipes for using to the best advantage all the available provisions for a camp. The officers at Sebastopol made a highly favorable report of Soyer's *field-kitchen*, a kind of camp-stove, with a caldron holding 12½ gallons: two such stoves would easily cook for a company of 100 men; both could be carried by one mule, with sufficient dry wood for three day's fuel. Though mainly intended for boiling, the apparatus afforded facilities for many varieties of cooking. When M. Soyer returned to England, he made a few improvements; and finally the apparatus presented itself as a sort of upright can, suitable for boiling,

steaming, baking, roasting, stewing, and making tea or coffee: with 14 lbs. of fuel, one of these would cook for 50 men; and if twenty such were put near together, four cooks could serve for 1000 men.

A committee which inquired on the subject of barrack economy some years ago, recommended that every large barrack should have a bakery with two ovens, where the men could learn to make and bake their own bread; and that the barrack-kitchens should be so furnished as to enable the men to bake their meat if so inclined instead of being confined, as heretofore, almost wholly to boiled dinners.

A school of cookery has been formed at Aldershot, where men are trained to act as sergeant-cooks, of whom there is now one to each regiment. His duty is to superintend and direct the operations of the soldiers detailed from the several companies to act as cooks.

Numerous forms of apparatus have been invented for baking and cooking food in the field. Several of them are based on modifications of Papin's Digester; such as the compressed steam cooking-pot of Captain Warren. Steam baking-ovens have also been successfully used; and apparatus has been devised for cooking while *the kitchen itself is on the march.*

COOK ISLANDS, otherwise known as the Harvey Archipelago, were visited rather than discovered by the navigator whose name they bear, during his first voyage. They lie about midway between the Society and Navigator groups, near lat. 22° S. and long. 158° W. The principal members of the cluster are Mangeia, Atiou, Harvey, and Raratonga. The natives, estimated at about 15,000, have been generally converted to Christianity; Raratonga, in particular, being one of the most successful missions in Polynesia.

COOK, MOUNT, the highest peak of Australasia, is one of the Southern Alps in the South Island of New Zealand. It is 14,000 ft. high, is covered with perpetual snow, is difficult of access, and was scaled for the first time in 1882.

COOK'S STRAIT, discovered by Captain Cook on his first voyage, separates the north and south islands of the New Zealand group, and varies from 80 to 100 miles in width. The proof of its existence dissipated the popular belief that New Zealand, as previously known, was merely a salient point of a great southern continent.

COO'KSTOWN, a town in the county of Tyrone, Ireland, 23 miles E.N.E. of Omagh. It consists of one very long and broad street, shaded with trees. It has a linen trade. Pop. (1881) 3870.

COOKTOWN, on the extreme north of Queensland, 1050 miles north of Brisbane, is one of the chief ports of the colony, though only founded in 1873. There are already handsome banks, schools, and public buildings. Pop. about 5000, of whom 3000 are Chinese. Near there are gold diggings and iron mines, and fisheries of beche de mer.

COO'LIES, or COULIES, originally the name of one of the aboriginal or hill tribes of Hindustan. From the circumstance that many of this tribe are employed as laborers and porters in Bombay and other places, the name is applied by Europeans in Hindustan to porters in general; and it is now used to denote emigrant laborers from India and China to tropical and other countries.

The importation of this useful class of laborers to the Mauritius, West Indies, and British settlements on the mainland of South America, has grown up as a result of negro emancipation—the emancipated slaves showing an indisposition to become regular laborers. Hence the necessity for resorting to imported labor from India or China.

Much difference of opinion prevails as to the propriety of coolie immigration. It is one of those vexed questions on which something can be said on both sides. We would refer to Mr. A. Trollope's *West Indies and Spanish Main* (1860), for some general observations on the introduction of C. to certain British West India settlements. A later work by Mr. Jenkins, *The Coolie, his Rights and Wrongs* (1871), though relating exclusively to British Guiana, is full of most interesting matter. The conclusion at which he arrives regarding the system is thus expressed: 'Taking a fair review of the whole system, it is one which spite of its disabilities, its difficulties, its present evils, is full of promise, and, in my belief, can be made, with care, and skill, and honest endeavor, not only an organization of labor as successful as any hitherto attempted, but one leading to almost colossal benefits' (p. 367). Mr. Jenkins, further asserts that 'any one who has seen the coolie in British Guiana is forced to admit that he has undergone a change for the better. In illustration of this, we may mention that the number of immigrant depositors in the British Guiana Savings Bank on June 13, 1870, was 1817, whose deposits amounted to 138,425 dollars, or over 70 dollars a head. The commissioners appointed by her Majesty to take evidence on the working of the system at the time Mr. Jenkins went out, state in their Report (pp. 854, 855): 'From papers submitted by the Immigration Agent-general, the commissioners gather, that in 12 ships which sailed with returning Indian immigrants between 15th November 1834 and the 11th November 1869, 2828 immigrants took away with them money acquired in the colony to the amount of 433,369 dollars, or £94,452.' The great drawbacks of the system appear to be the reckless mode of recruiting in India; the insecurity, if not the actual worthlessness, in Guiana of contracts drawn up in the former country; the severe penalties attached to breach of contract, and the practical difficulties, as the law stands at present, in the way of the coolie obtaining a remedy for any injustice inflicted on him. Immigration from China was stopped for all the West Indies in 1867, on account of the Chinese government insisting on a return passage at the end of five years, which the planters find will not pay them for their outlay. The total number of C. at present in British Guiana is about 50,000.

The reports (1872 and 1877) of the governor of *Trinidad* on the coolie question are satisfactory. In 1870 various laws were passed, all of a just and beneficent character. 'Among the most important provisions,' says Governor Longden, 'are those which regulate the allotment of immigrants upon their arrival in the colony, the supply of food to them during the first two years of their residence, their lodging, the medical attendance and hospitals provided for them, their wages, the exemption of women from labor, the prevention of vagrancy, and the right of repatriation.' In proof of this it may be stated, that although the coolie has a right to a free passage back to India at the public expense, after a continuous residence in the island for ten years, in many cases he has preferred to commute this right for a grant of ten acres of crown land, and to settle permanently in the colony. The number of Indian immigrants in 1871 amounted to 27,400. In addition to these must be reckoned 1400 Chinese.

Sir J. P. Grant, while governor of *Jamaica*, was no less emphatic in expressing his opinion that a great change for the better has taken place in the treatment of the coolie in that island also. His words are (*Report* for 1871): 'Under the old state of things this department [the Immigration Department] in Jamaica was in a disgraceful state, but it has now been completely reformed under the new system introduced by the new law of 1869.' This law secures to the coolie full payment of day-wages at the rate fixed by law as a minimum, unless where he prefers task-work, and also regular daily rations during the whole of his five years' term of indenture, besides putting an end to all stoppages of wages at the arbitrament of only one party to the bargain. Many of the details of medical supervision are extremely creditable to the planters. The public returns for 1872 give the gross number of Indians at 7793; for 1879, at 15,134. Here also, as well as in Trinidad, the C. show a disposition to become settlers on the crown lands.

Some recent reports from the island of *Mauritius* are less encouraging, which is much to be deplored, because that island contains more C. than all the rest of our colonial possessions put together. Out of a total population of (1881) 359,419, more than 247,000 were Indian immigrants. It would seem that the relations between employers and employed are not quite satisfactory, though here too, improvement can be noted.

Besides what may be called the *legitimate* traffic in Chinese C. (stopped at present), an infamous counterfeit was long carried on at Macao (q. v.). Native crimps brought thousands of their countrymen to that Portuguese island, and shipped them for Cuba and Peru. This 'involuntary emigration,' as it has been called, began in 1848, and as many as 13,000 persons were shipped in the course of a year; but as in reality it was nothing more than an elaborate system of kidnapping, the Chinese and British governments, in 1872, prohibited any vessel suspected of being engaged in this trade, from fitting out in any Chinese or British port, and the 'trade' was practically destroyed in consequence. At the close of 1873, the Portuguese government formally declared the 'exportation' of C. illegal, and the atrocious traffic may now be considered at an end.

Similar to the coolie immigration, though the laborers are not called C., is the importation of Polynesian natives into Queensland to work on the sugar plantations, and into the Fiji Islands. By laws of 1868 and 1875, the Imperial Parliament has secured the rights of a helpless but industrious race. See *In Quest of Coolies*, by J. L. A. Hope (1872).

COOMA'SSIE, the capital of the kingdom of Ashantee, Western Africa, is situated about 120 miles N.N.W. of Cape Coast Castle, in lat. 6° 35′ N., long. 2° 12′ W. C. occupies the side of a rocky hill, and is about four miles in circuit. The walls of the houses are mostly formed of stakes and wattle-work, the interstices being filled up with clay; the roofs are of palm-leaves. The king's palace is here. C. was captured and burned in 1874 during the war with Great Britain. See ASHANTEE. Pop. stated by natives to be 100,000; but other reports, including observations during the war, say 20,000.

COO'PER, James Fenimore, an American novelist, was born at Burlington, New Jersey, United States, September 15, 1789. Having received his early education from a private tutor, he, at the age of 13, passed to Yale College, and after three years' study there, entered the American navy as a midshipman. He remained six years at sea, gathering the experience of which he was afterwards to make such good use in his novels. On his retirement from the sea in 1811, he married; and the next ten years of his life were spent in a quiet, domestic fashion. In 1821 appeared his first work, *Precaution*, a novel that afforded no indication whatever of the talent he subsequently exhibited. In the following year, however, he published *The Spy*, a tale which at once secured for him a place in the first rank of novelists. By not a few critics he was even elevated to a higher pedestal than that which Scott occupied; but time sobered their judgment, while it still left him a deservedly high position as a writer of fiction. In quick succession followed *The Pioneers*, *The Pilot*, *The Last of the Mohicans*, *The Red Rover*, and *The Prairie*, with which C.'s genius culminated; for though between this date (1827) and 1850 he wrote about 26 different works, none of them equalled in merit those we have mentioned. The secret of C.'s success as a novelist lies in his graphic descriptive powers, and his thorough knowledge of the matters he describes—whether it be the boundless ocean or the broad prairie—together with an attentive study of character. Not a little of his popularity in America, however, must be attributed to his nationality; and in Europe a good deal of it was owing to the freshness of the scenes in which his stories were laid. About 1827, C. visited Europe, where he remained several years; the fruits of his sojourn, besides novels, being some ten volumes of sketches of European society, which added nothing to his reputation. Many of his works have been translated into most modern languages, and one—*The Spy*—can be read in Persian. C. died at Cooperstown, in the state of New York, 14th of September, 1851.

COOPER, Sir Astley, a celebrated English surgeon, was born at Brooke, in Norfolk, where his father was a curate, in August 1768. In his 16th year, he went to London, and placed himself under the care of Mr. Cline, one of the most noted surgeons of his day. He devoted himself with ardor to his profession, and was a constant attender at the dissecting rooms, and also at the lectures of the famous John Hunter. In 1787, C. was appointed demonstrator of anatomy at St. Thomas's Hospital; and four years after, he assisted Mr. Cline, who was surgeon at St. Thomas's, in the course of lectures on anatomy and surgery. In 1792, he was appointed Professor of Anatomy at Surgeon's Hall; and in 1800, surgeon to Guy's Hospital. In 1813, he received the professorship of comparative anatomy in the College of Surgeons. Meanwhile, C. had been enriching medical literature by various contributions. An essay on the effects resulting from the destruction of the *membrana tympani* gained him, in 1802, the Copley medal of the Royal Society, of which he was elected a fellow three years afterwards. In 1804—1807 appeared his great work on *Hernia*, with illustrations mostly of life-size, a contribution of the utmost value to medical science—the anatomy of the disease and the mode of operating for its relief being alike ill understood before—though in a pecuniary point of view it proved very unprofitable to himself. The practical part of his profession was not neglected during this time. He was the first to attempt the tying of the carotid artery, an attempt which, though unsuccessful in his hands, has since proved effectual in the hands of other practitioners. His annual income, which in the fifth year of his practice only amounted to £100, had in 1813 risen to the enormous sum of £21,000, perhaps the largest ever received by a surgeon. In 1817, he tried what has been considered the boldest experiment ever attempted in surgery, the tying of the aorta, which did not prove successful; and it has since been tried with no better result. In 1820, C. removed a steatomatous tumour from the head of George IV., who marked his appreciation of the operation by conferring a baronetcy upon C. some six months after. In 1822, he was elected one of the Court of Examiners of the College of Surgeons, and in 1827, President. In the following year he received the appointment of sergeant-surgeon to the king, and in 1830 was made Vice-president of the Royal Society. Other honors flowed in upon him. He was made a member of the French Institute, and corresponding member of the Royal Academy of Sciences, a D.C.L. of Oxford, and an LL.D. of Edinburgh.

Ever busy with his pen as with his knife, he, in 1822, published a work on *Dislocations and Fractures*, which threw much new light on the subjects discussed, and also suggested improved methods of treatment. His treatise on the *Anatomy and Diseases of the Breast* (1829—1840) was characterized by all the care, research, and originality which distinguished his previous works; so likewise was his *Anatomy of the Thymus Gland*, 1832. C. died 12th February 1841. A colossal statue to his memory is erected in St. Paul's Cathedral, London. As a teacher, C. possessed the faculty of communicating knowledge in a manner at once easy and agreeable; and he elevated medical surgery, the operations of which before his time have been described as a series of 'frightful alternatives, or hazardous compromises,' into a science.

COO'PERAGE, the art of making vessels of pieces of wood bound together by hoops. It is a very ancient art, such vessels having been in use among the Romans at the period of the Christian era. The upright pieces forming the sides of a barrel or cask, or other cooper's work, are called *staves*; and as casks are usually larger in the middle than at the top and bottom, this swelling, called the *belly* or *boulge*, is formed by skilfully shaping each stave so that it shall form part of the required double conoid, and that, when all are built and hooped together, their edges shall coincide perfectly; for this purpose each stave is made broadest in the middle, and narrowed down in a curved line towards each end. A skilful cooper can work this curve so accurately, that no further fitting or alteration shall be needed when the staves are put together. The staves are made to meet at their inner edges, and by driving the hoops very hard, the inner part is compressed until the slight gaping outside is closed, and thus slight inaccuracies of fitting are remedied.

There are several branches of cooperage. The *wet* or *tight* cooper makes vessels for holding liquids. The *dry* cooper does inferior work, such as barrels for containing dry goods, where an inferior degree of accuracy is sufficient. The *white* cooper makes churns, pails, &c., which for the most part have straight sides.

The best work is made of oak, which must be thoroughly dried before being put together. In warm countries, the drying of the sun is sufficient, and casks are therefore mounted in summer only; but in Britain, artificial drying is commonly resorted to. The hoops are hammered down from the narrow to the wide part of the cask, by means of a mallet striking a piece of wood held against the hoop. Iron hoops are sometimes put on hot, in order that their contraction on cooling may bind the work together.

CO-OPERA'TION is the term applied to a system of united effort for commercial or industrial purposes. It refers simply to a joint-stock copartnery on ordinary commercial principles, with limited liability of members; but by the interposition of the legislature for protecting individual interests, and encouraging self-denial and thrift, it possesses some distinct features. Usually, a co-operative society consists of a body, several hundreds in number, belonging the manual laboring classes, clerks, shop-assistants, &c.; the object being the distribution of articles of daily consumption among the members. A store is established under a manager, and assistants; goods of the best quality are purchased on favorable terms, and retailed to members at such an advance on cost price as will pay expenses and leave a small profit over. All the sales whatsoever are for ready money; no credit is given. Soundness in the articles bought and comparative cheapness are alone aimed at; and such results are attained by care in the management, and by adhering to the ready-money system. There is little trouble in book-keeping, no loss from giving credit. In point of fact, the customers of the concern are their own shopkeepers. To carry out any such principle of co-operation with advantage, there must be a large intelligent population, along with mutual trust, and a considerable similarity of tastes.

Membership is constituted by payment of shares. Ordinarily, the share is one pound sterling, to be paid up at once, or by small weekly instalments. By 18 and 19 Vict. c. 63, a member can own shares to the amount of £200. The shares are not transferable, unless the rules of the society make them so in whole or part, but in general non-transferability is adopted, with power of withdrawal; this constitutes the chief difference between C. and the common joint-stock system of business. The peculiarity of making the shares personal to the holder is most valuable; for by it all stock-jobbing or gambling in shares is prevented. When a member dies, his shares are accounted for to his representatives. If more money is paid in by members than is wanted, the directors can order the overplus to be taken back. The first shilling paid in, and the last shilling at the credit of a member, on drawing out, are carried to a fund called Redemption-money, which is designed to make good the deterioration of property. In this and some other respects, however, societies differ, according to the rules established. In some societies, shareholders or members are alone entitled to purchase goods at the stores; in others, the privilege is extended to 'friends of members' approved by the association.

By prudent management, numerous co-operative societies in England have reached an extraordinary degree of success. One of the more remarkable is the Rochdale Equitable Pioneers' Society. Beginning in 1844, with a capital of only £28, its affairs, at the end of 1880 stood thus: Number of members, 10,613; amount of funds, £323,225; business done in 1880, £283,654; profits in 1880, £35,023. In the proceedings of this society is offered a surprising example of what may be done by C. when properly conducted. One material cause of the prosperous extension of this undertaking consists in the fact that members allow their dividends and profits to accumulate to their credit, instead of drawing them

out as they accrue, and spending them. Another feature of this society consists in setting aside a part of the profits for the support of an Educational Department, in which are comprehended a lending library, a reference library, news-rooms, and collections of globes, maps, and scientific instruments. Out of the successes of this society sprang several gigantic concerns at Rochdale and elsewhere. The most notable of the London societies is the Civil Service Supply Association, designed for the benefit of others than the poorer classes of the community. It has four thousand five hundred shareholders, and many thousands of members. The wages paid amount to nearly fifty thousand pounds a year. The premises which form the headquarters of the Association are valued at thirty-two thousand pounds. In the first year, 1867, the sales of the Association represented a value of £21,322; in the year ending August 1880, the value of the sales reached the large sum of £1,420,000. On an average the prices charged to members and clients are at the rate of ten per cent. above wholesale prices, thus allowing a profit to defray working expenses, which amounted to about seven-and-a-half per cent. This allowance has proved more than sufficient; between March 1874 and August 1877, the surplus profit accumulated to the amount of very nearly one hundred thousand pounds. As the aim of the Association is 'to supply articles at the lowest possible prices,' it was thought desirable to reduce the rate of interest.

A step beyond retail store-keeping was taken in 1864 by the establishment of the North of England Co-operative Wholesale Society (Limited), the central office of which is at Manchester. Its object is to supply goods wholesale to co-operative stores. Besides importing foreign articles, the society purchases vast quantities of butter, provisions, and dry goods in all parts of the United Kingdom; latterly, the manufacture of biscuits and the business of banking have been added to this comprehensive concern, which has numerous branches and agents. C., however, has gone even beyond this. At Rochdale, Leeds, and elsewhere, co-operative societies composed of working-men have set on foot large cotton-factories, flour-mills, or other industrial establishments, which compete in the general field of manufacturing enterprise. In these concerns, the operatives receive weekly wages, and also dividends on profits after paying for management.

Co-operative societies are registered pursuant to 18 and 19 Vict. c. 63, 20 and 21 Vict. c. 101, and 30 and 31 Vict. c. 117. The rules of the society are binding, and may be legally enforced—protection is given to members, their wives, children, and heirs in enforcing their just claims, and against any fradulent dissolution of the society; the property of the society is declared to be vested in the trustee or treasurer, who may, with respect to the property of the society, sue and be sued in his own name; fraud committed with respect to the property of the society is punished by justices. With a view to afford means for mutual advice and consultation, there has been established a Central Co-operation Board at Manchester; the members connected with which hold congresses and conferences at different places.

For further information, we refer to the statutes; also to the *Co-operative News*; the reports of the above-mentioned bodies; the *Transactions of the Social Science Congress*; and Chambers's *Information for the People*, No. 85; Holyoake's *History of Co-operation* (1878); *Co-operation as a Business*, by Charles Barnard (1881); and Escott's *England* (2 vols., 1879). See likewise the article BENEFIT SOCIETIES.

CO-O'RDINATES. What is called the method of C. is an invention of Descartes, whereby algebra and the calculus may be employed in geometrical investigations. The method is sometimes called algebraical geometry—sometimes, and more properly, analytical geometry; and it is commonly treated under the heads 'geometry of two dimensions,' and 'geometry of three dimensions,' according as it is applied to investigate the properties of figures all in one plane, or of curved surfaces. The method is capable of popular explanation. C. are lines so measured off from a fixed point, called the origin of C., along fixed lines passing through it, called the axis of C., as to determine by their quantities the position of any other point relative to the origin. The first step is to find how to determine the position of a point in a plane. Take any fixed point in it for the origin of C., and through it draw two fixed lines—the co-ordinate axes—at right angles to one another. Then, if the perpendicular distance of the point from each of these axes be given, its position will be determined. Referring to Fig. 1, if P. be the point, and O be taken for the origin of C., OX, OY for the axes, then if we know NP or OM, the perpendicular distance of P from OY, and measure off from O, OM on the axis OX, and through M raise a line perpendicular to OX, P must lie in this line, for it contains all the points in the plane which are at the perpendicular distance OM from the axis OY.

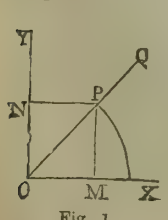

Fig. 1.

Similarly, if ON or PN, the perpendicular distance of P from the axis OX, be known, and we measure that distance off from O along OY, and through N draw a perpendicular to OY, the point must be in that perpendicular. It is therefore at the intersection of the perpendiculars through M and N respectively. When, as in the figure, the fixed lines are at right angles to one another, the C. OM, ON are called the rectangular C. of the point. Let us now see what use can be made of this mode of determining the position of the point, for the discovery of the properties of lines and surfaces. As the values of the C. change for the different points in the plane, they are denoted by the variables x and y. Now, if we suppose the point P to begin to move according to a determinate law, and the C. to change their magnitudes so as always to be its C., knowing the law of P's motion, we are able to express in algebraical language the law of the corresponding changes in its co-ordinates. For instance, if P moves, so as to be always at the same distance from O, OP is constant, and (47th Prop. Euclid, Book I.) the square on OP is equal to the sum of the squares on OM and PM. Putting this into algebraical language we have the equation, $x^2 + y^2 = R^2$, or $y = \pm\sqrt{R^2 - x^2}$, where R = OP. This is called the equation of the circle referred to its center as origin, and to rectangular C.; and it expresses the law according to which the changes of the C. must take place: and from this equation, combined with that to a straight line, &c., every property of the circle may be determined. If P move so that the sum of the distances from two fixed points shall always be the same, and we express the relation between x and y in that case, we should have the equation of an ellipse. This suffices to show in a general way the nature of the method. Equations between x and y are called the equations of the lines, whether straight or curved, traced out by the point P; and by means of them, though they but express relations between *quantities*, the *qualities* of the lines to which they refer may, by artifices explained in every treatise on the subject, be detected. Nay, by assuming equations between x and y, and examining the lines which points represented by them would trace, many singular curves have been discovered. There are a variety of conditions to be attended to in the interpretation of such equations, depending on the assumptions set out with, in choosing the origin and axis. The axis of x or OX being taken to the right of the origin, and the axis of y or OY being perpendicular to it and above it, x and y are counted positive when they are measured along their axes to the right of and above the origin respectively, and negative when they are measured to the left and downwards respectively.

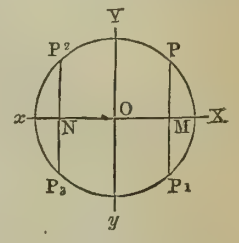

Fig. 2.

Suppose $x = OM = ON$, and $y = MP = MP_1 = NP_3 = NP_2$, the C. of the points P, P_1, P_2, P_3 would be $(+x, +y)$, $(+x, -y)$, $(-x, +y)$, $(-x, -y)$ respectively. These points being equidistant from O, we may suppose a circle to pass through them. Recurring now to the equation of the circle, $y = \pm\sqrt{R^2 - x^2}$, the meaning will be seen of the two values + and − of y given by the quadratic. Often the axes of C. selected for convenience are oblique, i. e., inclined at some other angle than a right angle. An equation between C. referred to one set of axes may always be transformed to C. referred to another, by the process known as the transformation of co-ordinates. A similar transformation of equations by the same process may be made where it is desired to refer the line to a new origin.

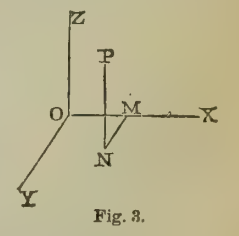

Fig. 3.

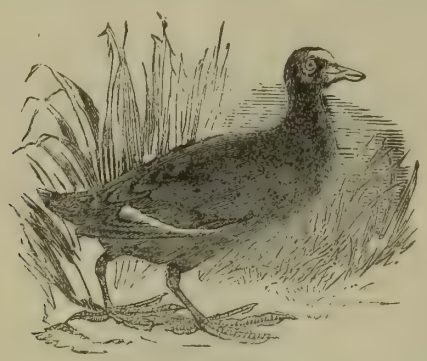
What has hitherto been said refers entirely to the C. of a point in a plane, or to what is called geometry of two dimensions. But the rationale is the same with that of connecting in equations the C. of points in space—the subjects of geometry of three dimensions. The position of a point in space requires three C. to determine it, and these are usually denoted by the symbols x, y, z. An origin being taken, and three axes, OX, OY, OZ, mutually at right angles to one another, the point is referred to the three planes through these axes. z, or PN, is its height above the plane through YOX; y, or NM, is its distance perpendicularly from the plane XOZ; and x, or OM, is its perpendicular distance from the plane ZOY. It is clear that these three determine the position of the point. In three dimensions, as in two, the problem may be stated to be: Given the law of the motion of P, to express the law regulating the variations of its C. as it moves. The algebraic expression of the latter law is, the equation of the surface traced by the point in moving over all the space it can traverse consistently with the law of its motion. The method of C., besides its use in geometry, is of great value for resolving forces in mechanics, and also for finding the resultant of a great many of them.

COORG, a province under the government of India, bounded by Mysore, Malabar, and Canara, is situated in lat. 11° 56′—12° 45′ N., long. 75° 25′—76° 13′ E. It contains about 2000 sq. miles; pop. (1871) 168,312; (1881) 178,283. Down to 1834, it was a native principality of ampler dimensions. As now defined, C. appears to be wholly within the basin of the Cauvery, one of the chief tributaries of the Bay of Bengal. From its elevated situation—the lowest point is more than 3000 feet above the sea—C. is exposed to both the south-west and north-east monsoons.

Hence the yearly fall of rain amounts to about 120 inches. For the same reason, the temperature is comparatively low and equable. Nearly the whole of this rugged region is covered with forests, more or less dense, but seldom so full of undergrowth as to form jungle. The zoology of C. comprises elephants, tigers, bears, &c., with birds and reptiles in vast variety. The natives, mostly Nairs, are handsome and athletic. Among them there exists a community of wives between brothers. But C. has perhaps nothing so worthy of notice as its artificial fortifications. The country is intersected by ramparts, which are from 15 to 25 feet in height, and by ditches of about 10 feet in depth and about 8 in width; while, being in some places double or triple, or even quadruple, they measure in aggregate length upwards of 500 miles. These works are very ancient. The true name of this territory is *Kudagu*, C. being a corrupt form.

COO'SY—not to be confounded with the much smaller Coosy which enters the Hoogly from the right below Calcutta—is one of the largest rivers of India. It rises in lat. 28° 25′ N., and long. 86° 11′ E., on the southern slope of the Himalayas, receiving, however, at least one affluent from the northern face of that range. On emerging from the mountains, in lat. 26° 45′, and long. 87° 13′, it shows a greater volume than does the Ganges itself, in the corresponding position of Hurdwar. After a course of 325 miles in all, through the state of Nepaul and the district of Purneah, it joins the Ganges from the left, in lat. 25° 19′, and long. 87° 19′.

COOT (*Fulica*), a genus of birds of the order *Grallæ*, either ranked in the family *Rallidæ* (rails, crakes, &c.), or in a separate family, *Lobipedidæ*, which differs chiefly in having the toes edged with a scolloped membrane, thus making an approach to the web-footed birds. Coots have a strong, straight, and somewhat conical bill, the base of which extends up the forehead, and there dilates so as to form a remarkable naked patch. The tail is very short. They are aquatic in their habits, preferring lakes or pools with reedy margins, and retreating among the reeds on any alarm. The Common C. (*F. atra*) is found in most parts of Europe, Asia,



Common Coot (*Fulica atra*).

and the north of Africa; occurring in the more northerly regions as a summer bird of passage, which is the case in the north of Scotland; although in the more southerly parts of Britain it is plentiful during winter. It is about sixteen inches long, of a black color, with a narrow white bar across the wings, and the naked patch on the forehead pure white, from which it is often called the Bald Coot. It makes a large nest of water-plants among reeds or rushes. Although not very highly esteemed for the table, the circumstance that many can be killed by a single shot, on the mud-banks to which coots resort in winter, as on the south coast of England, makes C. shooting profitable to the fowlers who purvey for the market.—The American C. (*F. Americana*), a very similar species, is found in all parts of North America, from the West Indies to the Saskatchewan.

COO'TEHILL, a town in the north-east of Cavan county, Ireland, on the Cootehill, an affluent of the Annalee, 28 miles west-north-west of Dundalk. It consists chiefly of four wide streets, and is situated at the west end of a series of lakes navigable for about 7 miles to the east to near Ballybay. It has a trade in linen. Pop. (1881) 1789.

CO'PAIS, LAKE. See BŒOTIA.

COPAI'VA, or COPAIBA. BALSAM OF, a valuable medicinal substance, consisting chiefly of a resin (*Resin of Copaiva*) and a volatile oil (*Oil of Copaiva*). It flows from incisions made in the stems of trees of the genus *Copaifera*, trees with pinnate leaves, of the natural order *Leguminosæ*, sub-order *Cæsalpinieæ*, natives of the tropical parts of America. It has a peculiar, not disagreeable odor, and an acrid taste. It has stimulant properties, is diuretic when taken in small doses, aperient in larger doses; but is principally useful from its powerful action on the mucous membranes. It is much used in affections of the urino-genital system, and is also employed in chronic catarrhs, &c. Balsam of C. is not unfrequently adulterated with castor oil. The Wood Oil (q. v.) or Gurgina Balsam of India, the produce of a species of *Dipterocarpus*, is sometimes sold in Britain as balsam of copaiva.

Balsam of Copaiva Tree.

CO'PAL, a resinous substance used for a variety of purposes in the arts. It appears in commerce in smooth rounded masses, colorless or lemon-yellow, translucent or transparent, rather brittle, and in a cold state, almost without smell or taste. It is readily fusible and inflammable, is insoluble in water, and only partially soluble in alcohol and oil of turpentine, but becomes entirely soluble in them when it has been for a short time melted. Various useful pale-yellow or almost colorless varnishes and lackers are made of melted C. and alcohol, oil of turpentine, or boiled linseed oil.

C. is said to be a general Mexican name for resins or gums, and the C. of commerce was perhaps originally brought from Mexico. C. is also obtained in Africa, Brazil, Madagascar, and India. Mexican C. is now believed to be the produce of a species of *Hymenæa*, a tree of the natural order *Leguminosæ*, sub-order *Cæsalpinieæ*. *Vateria Indica*, a large tree of the natural order *Dipteraceæ*, yields the C. of India, very nearly resembling true C. in its properties, but also sometimes called Gum Animé (q. v.) in British commerce.—A mineral substance resembling C., and therefore called *Fossil C.* or *Copaline*, is found in some places, as at Highgate, near London, from which it is called *Highgate Resin.*

COPA'LCHE BARK, a bark resembling Cascarilla Bark (q. v.) in its properties, and produced by shrubs of the same genus, *Croton pseudo-china* and *C. suberosum* (see CROTON), natives of Mexico. The former yields a variety of small quills; that produced by the latter is in larger quills, and has a corky epidermis. C. B. is much used as a substitute for *Cinchona* in the cure of intermittents in Mexico, and is imported, although not to a large extent, into Europe.

COPALM. See LIQUIDAMBAR.

COPA'N, a ruined city of Honduras, on the borders of Guatemala, in Central America. It stands on a stream of its own name, an affluent of the Montagua. The remains, extending about two miles along the river, comprise a temple of 624 feet in length, various pyramidal structures and sculptured idols similar to those of Egypt and India.

COPA'RCENARY. An estate in England originating in descent to two or more persons, called thence coparcenars or parcenars. It generally arises under the rule of law which makes the daughters of one dying without male heirs inherit equally, but it may also arise by local custom, as in the case of Gavelkind (q. v.). Although the property remains unsevered, yet each parcenar is entitled to a distinct share of it, and consequently there is no benefit of survivorship, but the right of each descends to his or her heirs, who are still called coparcenars with the surviving original parcenars. The rule of descent is also *per stirpes*, so that the heirs of one who has predeceased the common ancestor take only the share which would have come to their immediate ancestor had he or she survived, and thus a grandson of the common ancestor will also exclude his own sisters. If one of the coparcenars alienates his share, the C. is destroyed, and the estate becomes a tenancy in common (q. v.). C. may also be destroyed by partition, when the estates become in severalty (q. v.). This may be effected either by voluntary agreement, or by a suit in Chancery. Such parts of the property as cannot be divided (such as the manorhouse, &c.), pass to the eldest sister or her issue, but an equivalent in value is assigned to the remaining sisters.

An Advowson (q. v.) is exercised in turns, according to seniority. If the estates in C. are by descent reunited in one person, they become again an estate in severalty.

COPA'RTNERY. See PARTNERSHIP.

COPE, an ecclesiastical vestment, worn during the celebration of mass, at processions, vespers, and other solemnities. The C. was originally a cloak worn for ordinary purposes. In form it is a semicircle, without sleeves and with a hood. It is fastened across the breast with a clasp or morse. Copes soon began to be ornamented with embroidery, and even with jewels; and so early as the 13th c. they became the most magnificent and costly of all the vestments of the priesthood.

Cope.

COPE, a custom or tribute due to the crown, or lord of the soil, out of the lead-mines in Derbyshire.

COPE, SIR JOHN, an English general of the first half of the 18th c., is known through his ignominious defeat at the battle of Prestonpans by the Highlanders, under Prince Charles Edward Stuart, September 21, 1745, and more widely through a sarcastic Jacobite song.

CO'PEC, a Russian coin, the oldest kind in Russia, and the first substitute for furs as a medium of exchange. The name is derived from the Russian word for a lance, St. George and his lance having anciently figured on the coin. Copecs were originally coined of silver alone, but copper copecs were afterwards introduced. The present C. is the hundredth part of a silver ruble, which is worth 3*s*. 1½*d*. sterling.

COPENHA'GEN (Dan. *Kjöbenhavn*, 'Merchants' Haven'), the capital of Denmark, is situated on the island of Sjælland, in the Sound, which is here about 15 miles broad, and includes the island of Amager or Amak, which is separated from Sjælland by a narrow arm of the sea, forming a fine and capacious harbor. Lat. 55° 41′ N., long. 12° 35′ E. C. lies very low, and was strongly fortified until 1864, when the land-works were destroyed, although the citadel of Frederickshavn, and some of the batteries on the sea, were left in a condition to admit of being defended in case of emergency. The old ramparts of the city and citadel, which are planted with trees, afford pleasant walks. The population of C. was, in 1880, 235,254. Copenhagen proper, in Sjælland, and Christianshavn on Amager, which form the main divisions of the city, are united together by the bridges Langebro and Knippelsbro. The business quarter of C. stretches from its noble harbor in a N. E. direction towards the principal and central square, Kongens Nytorv, which in itself forms the focus of the life of the city. Further N. and E. of this point lies the aristocratic quarter, with the handsome Amalienborg Square of royal and administerial palaces; and this district is bounded in the extreme N. by the citadel, and the adjoining public gardens and walks on the shores of the Sound. C. has suffered so severely during the last century from the effects of fires and bombardments, that the city contains comparatively few remains of antiquity. Amongst its few buildings of historical interest or intrinsic beauty, we may instance the metropolitan cathedral-church, known as Vor Fruekirke, rebuilt after the bombardment of 1807, and distinguished now for possessing statues of Christ and the Apostles, together with a kneeling angel bearing a baptismal shell-font, which were designed, and in part executed, by Thorwaldsen himself. Trinitatiskirke, only remarkable for its round tower, which is ascended by a winding causeway instead of steps; and Holmens' Kirke, containing interesting monuments to the great naval heroes, Juel and Tordenskjöld. The royal palace, called Christiansborg, is one of the most extensive in Europe, though its architectural character is not high. It contains, however, a picture gallery, and some noble works of art by Thorwaldsen and others. The castle of Rosenborg, where the regalia are kept, contains interesting collections of objects of art; and the palace of Charlottenborg is now used as an academy of arts.

The university was founded by Christian I. in 1479, but the constitution under which it at present exists bears date 1788. The number of professors amount to about 50, and that of students to 1200. Connected with the university are a surgical academy, two observatories, a botanical garden, a polytechnic institution, and a library of 240,000 volumes, containing also a great collection of ancient Persian MSS., and another of ancient northern MSS. C. is the center, not only of Danish, but of northern literature and art, and is the seat of a number of societies for the advancement of these in all their branches, amongst which the most important are the Literary and Scientific Association, founded in 1742; the Academy of Arts; and the Royal Society for Northern Antiquities, founded in 1825. The royal library contains 500,000 volumes, besides great treasures of Sanscrit and other MSS. The Museum of Northern Antiquities in Christiansborg is unrivalled in its kind, and contains an admirably arranged collection of *stone* weapons, ornaments, &c., to 500 B.C., bronzes to 500 A.D., and articles wrought in iron, silver, and gold to 1000 A.D., besides numerous specimens to illustrate arts and manufactures in Scandinavia during the Christian ages. The Thorwaldsen Museum, opened in 1846, consists of works of art by that sculptor himself, and others left by him to the Danish nation, for which a separate building has been erected. C. contains also a number of well-supported benevolent institutions. Since the war of 1864, C. has rapidly recovered its commercial activity, and now its trade is steadily increasing; between 8000 and 9000 vessels annually enter its port. The chief exports are grain, rape-seed, butter, cheese, beef, cattle, wool, and hides. Excellent watches are made at C.; its royal porcelain works have long enjoyed a European reputation, but besides these and a few manufactories for gloves, glass, &c., C. has no branches of industry worthy of any special notice in this article.

About the middle of the 12th c., C. was an insignificant fishing-village, in the neighborhood of which Bishop Axel, or Absalon, built a castle. He bequeathed the castle, village, and neighboring district to the bishopric of Roeskilde. In 1254, the village obtained the privileges of a town, and in 1443 King Christopher made it the capital of the kingdom. It was several times attacked by the Hanseatic League; was besieged and bombarded by the Swedes in the 17th c.; suffered grievously by fires in 1728, 1794, and 1795; witnessed a great sea-fight in its roads on 2d April 1801, when the English, under Sir Hyde Parker, with Nelson as his second in command, were victorious over the Danish fleet; and was bombarded by the English from the 2d to the 5th of September 1807, when great destruction was wrought, both in houses and public buildings, and about 2000 persons lost their lives.

COPERNICAN SYSTEM, THE, is that which represents the sun to be at rest in the center, and the earth and planets to move round it in ellipses; in other words, it is that which we now know, on unquestionable evidence, to be the true system of the world. It got its name from Copernicus, but, in point of fact, it may be described as being a growth in which he was only one of many contributors. The merit of having first formed the general notion of the system seems to be due to Pythagoras; Copernicus has the credit of having, after the lapse of centuries, again drawn the attention of philosophers to it, and of having greatly increased the probability of its truth by his calculations and arguments; for the rest, the glory of having matured its idea belongs to Kepler, Galileo, and others, and to our own Newton, who, through the discovery of the law of gravitation, demonstrated its truth effectually. Many who have been used to reverence the name of Copernicus in connection with this system, would be surprised to find, on perusing his work *De Revolutionibus Orbium*, how much of error, unsound reasoning, and happy conjecture combined to secure for him in all times the association of the system with his name.

De Revolutionibus Orbium, dedicated to Pope Paul III., consists of six books, in which Copernicus undertook to demonstrate his whole system. The character of the reasoning which then passed for demonstration, must be borne in mind in judging of the author's procedure in establishing his various positions. It was then thought a sufficient demonstration of a phenomenon to make a supposition, on which its occurrence would be intelligible, without attempting to bring the supposition itself, by an induction of facts, within the truth of nature; many abstract propositions, too, which would now appear to be simply silly, were at that time universally admitted to be of great weight in scientific arguments.

Illustrations of both of these peculiarities may be gleaned from the first of the six books of *De Revolutionibus*. It contains the following propositions: 1. That the universe is spherical. This is established by such arguments, as that the sphere is the most perfect figure, &c. 2. That the earth is spherical, which flows from the same kind of considerations. 3. That the earth and sea make one globe. 4. That the motions of all the heavenly bodies must be uniform and circular, or compounded of uniform and circular motions. Here, again, we meet with singular reasons. A *simple* body must move circularly, and nothing but circular motion could give periodicity to phenomena. 5. That, supposing the distance of the stars to be immense, there is no reason why the earth should not have a motion round its axis as well as a motion in its orbit. 6. That the sphere of the stars is immensely distant. The proof is fanciful, and shows he had no notion of a universe of stars pervading space. 7 and 8. The ancients were wrong in placing the earth at the center of the universe.

The arguments under this head are as imaginary as those which they were designed to refute. The falling of a body to the earth he deduces from the assumption, that it is only given to wholes to move circularly, while it is of the nature of parts, separated from their wholes, to move in right lines. That there must be a *centrum mundi*, an entity unknown to modern science, is admitted, the

question being as to its position. 9. It is possible for the earth to have several motions. 10. He establishes the order of the planets, and draws a diagram of the system much as it is now represented. It may be observed that, following the old systems, such as the Ptolemaic, he lays down *a sphere* for the fixed stars. (See FIRMAMENT.) It is clear, also that he had no idea, of the motions of the planets other than that they were such as would be caused by their being fixed in immense crystal spheres revolving round the sun.

The most brilliant and valuable part of the *De Revolutionibus* is that in which he explained, for the first time, the variations of the seasons, the precession of the equinoxes, and the stations and retrogradations of the planets. In general, his explanations are right, and perfect as to the general nature of the causes of the phenomena. But Copernicus had neither mathematical nor mechanical knowledge sufficient to enable him to explain more than the mean motions of the solar system. To account for irregularities, he was obliged to introduce a system of epicycles entirely resembling that of Ptolemy. See PTOLEMAIC SYSTEM. This arose from the false notion of his times, that all motions must be compounded of circular ones, with the application of which idea, and with the invention of convenient epicycles, the greater part of the *De Revolutionibus* is occupied. It may further be added, to rectify the vulgar notion regarding the relation of Copernicus to the system of the heavens, that he had no answer to offer to the mechanical objections to his system. Most of them, indeed, were such as could not possibly be met in the then state of mechanical knowledge. One of the commonest was that against the axial motion of the earth, that it was inconsistent with the fact of bodies falling to the points of the earth directly beneath the points from which they are dropped; for this he had no answer nor could he have, the laws of motion being not yet discovered. Such being the state of the case, the reader will consider whether, when Copernicus wrote that he held the doctrine of the earth's motion as a mere hypothesis, and not as absolutely in fact true, it is more likely that he made a concession to the religious prejudices of his times, or to difficulties surrounding his hypothesis, which he could well appreciate though not overcome.

COPERNI'CIA. See CARNAHUBA PALM.

COPE'RNICUS, NICOLAS, an eminent astronomer, was born at Thorn, in Prussia, 19th February 1473. He was instructed in the Latin and Greek languages at home; afterwards he was sent to the university of Cracow, where he studied philosophy and mathematics, and took the degree of doctor of medicine. He also studied law at Bologna University. His natural bent, however, was towards mathematics, the study of which he pursued with passion through all its branches.

Having become enamored of the study of astronomy, he projected a journey to Rome in his enthusiastic admiration of Regiomontanus, who resided there, and was then the most illustrious of the astronomers. On his arrival he was kindly received by Regiomontanus, whom he soon rivalled in fame. Here his reputation, and the favor of his distinguished friend, led to his being chosen professor of mathematics, which he taught for several years most successfully. After several years he left Rome and returned to his native country, where, having entered into holy orders we suppose, he obtained through his uncle, the Bishop of Warmia, a canonry at Frauenburg, in the enjoyment of which he passed the rest of his life. His working-day, it is said, he divided into three parts—one devoted to the duties of his office, another to giving medical advice gratuitously to the poor, and the third to study.

Soon after his return to Prussia, he began, in his 35th year (1507), to apply his fund of observations and mathematical knowledge to correcting the system of astronomy which then prevailed. The result was his *De Revolutionibus Orbium*, some account of which is given in the previous article. He completed it in 1530, in his 57th year. But though finished at this date, it was twelve years later before he could be persuaded to give his book to the world by his friends, who urged its publication out of regard at once to his fame and the interests of science. Perhaps the strongest motive for his reticence, was the fear of the unpopularity which the work threatened to bring him (for many who had heard of the views it advocated, doubted if these were in harmony with religion), while it is pretty certain that his desire to conciliate the church (which afterwards showed in the case of Galileo what it was capable of in such a matter), led him to dedicate his book, when it was published, to Pope Paul III. It is related that the first copy of this labor of his life reached him when he was no longer able to enjoy the triumph. An attack of dysentery, followed by paralysis of the right side, had destroyed his memory and obscured his understanding. In this state he lingered several days. The copy, it is said, just arrived a few hours before he died. It was placed in his hands, and he *seemed* to know it! He died 24th May 1543, aged 70.

Besides the *De Revolutionibus*, may be mentioned among C.'s works a treatise on Trigonometry, entitled *De Lateribus et Angulis Triangulorum*, Wittemberg, 1522, 4to; and *Theophylactici Scholastici Simocattæ Epistolæ Morales, Rurales, et Amatoriæ, cum Versione Latina*. He also wrote a work on money, and several MS. treatises from his pen are said to be in the library of the bishopric of Warmia. His life has been written by Gassendi. See also the life by Von Hipler (1873) and Polkovski's *Zywot Kopernika* (Warsaw, 1873).

COPIAPO', a name of various application in the north of Chili, marking at once a volcano, a river, a district, a village, and a city. 1. The volcano is a peak of the Andes, in lat. 27° 32′ S. 2. The river has a westerly course of 120 miles from the Andes to the Pacific; its mouth being in lat. 27° 20′ S., and long. 71° 2′ W. 3. The district, sometimes reckoned a part of the province of Coquimbo, is rich in silver and copper; but, excepting on the immediate banks of streams, almost valueless for agricultural purposes. 4. The village, known as Port C., stands at the mouth of the river, containing about 1200 inhabitants. 5. The city built on the river, about 30 miles from the sea, had in 1875 a population of 11,432. It is connected by railway with Caldera, a harbor of the republic, about 20 miles to the north of the mouth of the river. The C. Railway has 120 miles in operation. The shares owned by British subjects amount to the sum of 1,500,000 dollars. The exports from this region are copper, silver, cobalt ore, and hides. The imports are almost wholly from the United Kingdom, consisting of coals, iron, bricks, machinery, &c. There is also some trade across the Cordillera with the Argentine Provinces.

CO'PLAND, JAMES, a distinguished physician, born at Deerness, in the Orkneys, in 1792. After studying medicine at Edinburgh, he traveled on the continent, and subsequently undertook a journey to Africa, to investigate the nature of epidemic diseases prevalent in tropical lands. He settled in London about 1820, and was made a member of the Royal College of Physicians. In 1822, he undertook the editorship of the *London Medical Repository;* and being chosen in that year to deliver the annual oration of the London Medical Association, he in his lecture advanced a new theory of electro-galvanism. His *Outlines of Pathology and Practical Medicine*, in which he especially treated of the ganglionic nerves and their functions, and proposed a new and more simple classification of diseases, appeared in 1822, and the *Elements of Physiology* in 1824. But C.'s most important work was the *Dictionary of Practical Medicine*, four closely printed volumes, to which he devoted the labor of many years. This comprehensive work has attained an extensive reputation in America and Germany, as well as in England. The views given in his essay on *Pestilential Cholera*, published in 1832, when the cholera first appeared in Britain, have been confirmed by experience. He also published, besides various contributions to medical periodicals, a treatise on Palsy and Apoplexy, and, in connection with Dr. Annesley, one *On the Diseases of Warm Climates*. He died in 1870.

CO'PLEY, JOHN SINGLETON, the father of the late Lord Lyndhurst, and a historical painter of some note, was born at Boston in the United States, July 3, 1737. In 1774 he came to England, and after a visit to Italy, settled permanently in London. In 1783 he was elected a member of the Royal Academy, and died in 1815. C.'s best work is the 'Death of Lord Chatham,' now in the national collection. Besides it, may be mentioned his 'King Charles Ordering the Arrest of the Five Members of Parliament,' the 'Death of Major Pierson,' the 'Assassination of Buckingham,' and 'King Charles Signing Strafford's Death Warrant.'

CO'PPER is one of the most anciently known metals, and its name is derived from the island of Cyprus, where it was first obtained by the Greeks. In the earlier times C. does not appear to have been employed by itself, but always in admixture with other metals, principally tin, forming what is now called bronze (q. v.). There is every reason to believe, that next to the large quantities of tin which they obtained, one of the great inducements which the Phœnicians had in making searches for metals in Great Britain, was the C. which they procured in their workings in Cornwall.

C. is sometimes met with in nature in a state of purity, but generally it is associated with oxygen, water and carbonic acid, forming the native carbonate of C. or *malachite* ($CuO,HO + CuO,CO_2$), or with iron and sulphur, forming the native sulphurets of C. and iron or C. *pyrites* (Cu_2S,Fe_2S_3). In smaller quantity C. occurs as the oxide (CuO), and sulphate ($CuOSO_3$), and in all cases the ore is obtained from fissures or veins in other rocks. The principal yield of C. ore in Great Britain is from the mines in Cornwall, but large supplies are also obtained from Australia, from Cuba and Chili, and recently from Little Namaqua Land, in South Africa. In North America, in the neighborhood of Lake Superior, C. ore occurs abundantly, and a thick vein of metallic C. is there found.

In the extraction of C. from its ores, the metallurgic processes followed are very tedious and complicated, which mainly arises from the difficulty of separating the iron and sulphur from the

copper. The general principle which regulates the working-up of the ore is to burn away the sulphur (S) as sulphurous acid (SO_2), and to carry off the iron by means of fluxes in the form of scoriæ or slag. Metallurgists enumerate ten distinct steps in the production of commercially pure copper.

C. (symb. Cu, from Lat. *cuprum*) has the equiv. 31·7—new system, 63·4. It is the only red metal, has the specific gravity 8·78 when cast, and 8·96 when rolled or hammered; fuses at 1996° F. (Daniell), and at a white heat passes off in vapor and burns with a green flame. It is very malleable, and can thus be beaten out into thin leaves; it is very ductile, so as to admit of being drawn out into thin wires; and its tenacity is only inferior to that of iron. It is a powerful conductor of electricity, and hence is employed in the construction of lightning-conductors, and in telegraph wires for underground or submarine communication. C. is also employed largely in the sheathing of wooden vessels, and in the coinage. See also ALLOY.

C. forms many compounds. There are two oxides. The black oxide (CuO) and the red oxide (Cu_2). The latter is employed in coloring glass of a ruby-red tint. The *green rust* which forms on the surface of a C.-sheathed ship, and on C. coins and vessels which lie in moist places for some time, is a carbonate of C., and is due to the carbonic acid and oxygen of the air acting upon the C. in the presence of moisture. It is very poisonous, and hence any barnacles which may attach themselves to the C. sheathing are poisoned. The carbonate of C., under the name of *blue verditer*, is largely prepared and sold as a pigment. The subchloride of C., moistened and exposed to the air, yields the pigment known as *Brunswick green*. There are several compounds obtained by allowing acetic acid to act upon oxide of C., which are commercially called *blue* and *green verdigris*. The sulphate of C., or *blue vitriol* (CuO,SO_3+5HO), is prepared by dissolving the black oxide in sulphuric acid, and allowing the salt to crystallize out. The crystals are large and present a fine blue color. It is soluble in water, and is extensively used by the dyer and calico-printer for the production of several blue and green colors. The solution of blue vitriol is also employed in the preservation of timber from dry rot and it forms a constituent of some writing inks.

Mineralogy.—Native C. is not of very rare occurrence; it is sometimes massive, or in grains, plates, &c.; sometimes crystallized in cubes or octahedrons; sometimes it assumes dendritic and other beautiful forms. Great masses of native C. have been found both in North and South America. One of the most productive copper mines in existence is that of Ookiep, Little Namaqua Land, South Africa. What are called C. ores in commerce, generally consist of the true ore disseminated through rock, and are therefore very variable in productiveness. Among the most plentiful and valuable C. ores is the *C. Pyrites* already mentioned, or *Yellow C. Ore;* but there is a richer ore called *Purple C.* or *Variegated C.* or *Bornite*, also a compound of sulphur, C., and iron. *Malachite* and *Azurite*, both consisting essentially of carbonate of C., are valuable ores; as are some ores which are essentially composed of oxygen and C., particularly *Red C. Ore* (*Cuprite*) and *Black C. Ore* (*Tenorite*). Some ores of C. contain also silver, and some contain arsenic, antimony, &c. *Gray C. Ore* is very compound, containing silver, mercury, zinc, antimony, arsenic, iron, and sulphur. *Atacamite*, wrought as an ore of C. in South America, is composed of chloride of C. and hydrochlorate of copper.

COPPER I'NDIGO is an ore of copper found in spherical masses of an indigo-blue color, in Thuringia and Vesuvius, and is very nearly pure sulphuret of copper. Its composition in 100 parts, is copper 64¾; sulphur, 32¾; iron, ½; and lead, 1.

CO'PPERAS is the commercial term for the sulphate of iron. See IRON.

COPPERED, COPPERING, in Ship-building, are terms used in reference to the sheathing applied to the bottom of timber-built ships. The copper so used is in sheets, weighing from 18 to 32 ounces per square foot, and usually measuring 48 inches by 14. A layer of felt, paper, or coarse linen, is first applied to the planking; and the copper is nailed down upon it. So much of the bottom as is immersed in the water is thus covered. The timbers are by this means protected from molluscs, cirrhopods, and weeds; and consequently the ship can sail quicker than if no such sheathing were applied. Some builders copper their ships up to load-water line, while others go no higher than the light-load line; there being a difference of opinion whether the intermediate space, sometimes dry and sometimes wet, ought to expose a wood or a copper surface.

A *copper-bottomed* ship always ranks better at Lloyd's than one not so sheathed. The same is the case with a ship said to be *copper-fastened ;* i. e., in which bolts of copper are used instead of iron in those parts of the ship immersed in water. Ships can be insured at a lower premium when thus provided.

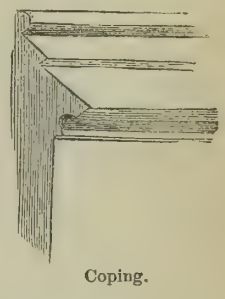
CO'PPERMINE RIVER—so named, in common with the mountains to the west of it, from the metallic products of the vicinity—enters a bay of the Arctic Ocean about lat. 68° N., and long. 116° W. Its overland discovery by Lieutenant Hearne, then of the Hudson's Bay Company's service, in June 1771, excited considerable interest, as incontestably proving that the supposed Strait of Anian, whatever might be the truth as to its westward terminus, had its eastward outlet, if any, only in the Icy Sea. The C. R. rises near a feeder of Great Bear Lake, which itself is tributary to the Mackenzie—the former of the diverging watercourses taking a vastly shorter route to the coast than the latter. Hence the C. R. is throughout little better than a series of falls and torrents, being thus, even without regard to its isolated position, but little available in itself for navigation.

CO'PPERPLATE PRINTING. See ENGRAVING.

CO'PRA, the dried kernel of the cocoa-nut, from which cocoa-nut oil has been expressed. It is much used in India as an ingredient of curries.

CO'PROLITES (from Gr. *kopros*, dung, and *lithos*, a stone), are the fossilized excrements of animals found in the Secondary and Tertiary strata of the earth's crust. Their true nature was first inferred from their occurrence in the bodies of several species of *Ichthyosaurus*, in the region where was situated the intestinal tube. It has been since shown that they are the voidings chiefly of saurians and of sauroid fishes. They often contain portions of scales, bone, teeth, and shells, the indigestible parts of the food on which the animals lived.

Occasionally, they may be found exhibiting the spiral twisting and other marks produced by the confirmation of the intestinal tube, similar to what is noticed in the excrement of some living fishes. These peculiar markings obtained for them the name, when their true nature was unknown, of 'larch-cones' and 'bezoar-stones.' C. are found to contain a large quantity of phosphate of lime; and as this forms a valuable manure, the deposits containing them have been of late years largely quarried by the manufacturers of artificial manures.



Coping.

COPS, COPING (Anglo-Sax. *cop*, Ger. *kopf*, the head). The merlons or rising parts of battlements are sometimes called cops, but the term coping is usually applied to the covering course of a wall, which is made either sloping or round, so as to throw off water. Where the coping is of hewn stone, it is frequently ornamented with a circular moulding running along the top, and sometimes the angle at the top is simply taken off, to prevent it from being chipped.

COPSE, or CO'PPICE, a natural wood or plantation, of which the trees are cut over from time to time, without being allowed to attain the size of timber trees, sending up new shoots from their roots or stools. Some kinds of trees—as the firs—are incapable of being treated in this manner, refusing to send up new shoots; but many—as the oak, birch, chesnut, ash, elm, maple, alder, hazel, and willow—very readily do so, at least if they have not been allowed to attain too considerable a size before being cut over. C.-woods are sometimes planted chiefly to vary and beautify the landscape, but more generally with a view to profit, either owing to great local demand for their produce, or to peculiarities of soil and situation. It often happens that owing to scantiness of soil or to unfavorable subsoil, oaks and other trees, after growing vigorously for a number of years, are arrested, and remain almost stationary in their growth. In such circumstances, it is advantageous to cut them over early, and to treat the plantation as a C., the former vigor being again manifested in the young shoots, and the land yielding in this way a greater return to its owner. Oak is much planted as C.-wood, in consequence of the demand for its bark: in some parts of Herefordshire, the trees are cut over every twelve years; but in the Highlands of Scotland, twenty-five or thirty years are often necessary for sufficient growth, nor is the bark thought to have attained it highest perfection till the stems are of this age.

The largest pieces of the wood are used for making wheel-spokes, and for other purposes of timber; the smaller portions for charcoal, and firewood. Ash is sometimes planted as C., with a view to the employment of the wood for handles of implements, hurdles, hoops, &c., the wood of the ash, even when very young, being highly valued for strength and elasticity. Chestnut copses are planted in England to supply hop-poles. Hazel is a very common C.-wood, being in great demand for making crates, &c. Besides the cultivation of different kinds of willow or osier for basket-making, in which they are cut over annually, some of the species are cultivated as C., and cut every five, six, or seven years, for hoops, crates, &c.; the species which is deemed most suitable of all being *Salix caprea*. See WILLOW. In some countries, C.-wood is particularly valued for the regular supply of fuel which it affords.

In cutting C.-wood, care is taken to dress the stools so that water may not lodge in them and cause them to rot. The size to which the stems are allowed to attain before being cut, and the frequency of cutting, differ according to the different kinds, and the uses intended. Stems more than four inches thick are generally cut with the saw, but smaller stems with a curved bill, cutting upwards. Extensive copses are sometimes divided into portions, of which one is cut every year.

CO'PTIS, a genus of plants of the natural order *Ranunculaceæ*. *C. trifoliata* is a native of the north of Europe, Siberia, Greenland, Iceland, and North America. It grows in swamps. From its long, thread-like, golden-yellow rhizomes, it derives the name of *Golden Thread*. Its leaves have three wedge-shaped leaflets, and its leafless stems bear each a solitary, rather pretty white flower.

CO'PTIS. Very similar to the *C. trifoliata*, noticed in the article COPTIS, is *C. teeta*, the *Golden Thread* of Assam, the root of which has long been in high repute in Assam and neighboring countries. It has come into extensive use in India as a bitter tonic, and is sold at a very high price. Great efficacy is ascribed to it as a tonic for patients beginning to recover; but it is of no value as a febrifuge.

COPTS, the Christian descendants of the ancient Egyptians. Various derivations have been given of the name, which, however, is most probably from the same root as E-*gypt*. The C. are in number about 150,000, only about a fourteenth of the population of the country. There are about 10,000 of them in Cairo. They are not of great stature, have black eyes, and rather curly hair, and in a number of points resemble the ancient Egyptians, from whom also they have inherited the custom of circumcision. They dress like the Moslems, but are generally distinguished by a black turban.

Their character is in general gloomy, deceitful, and avaricious. They are very expert in calculations, and are therefore much employed as accountants and book-keepers, by which they have acquired a great influence in the country, filling very important posts. In religion they are generally monophysites (q. v.) of the Jacobite sect; smaller sections of them, however, are united to the Greek and Roman Catholic churches. They ascribe their conversion from heathenism to St. Mark, whom they regard as the first patriarch of Alexandria. Their highest dignitary is the patriarch of Alexandria, whose residence, however, is in Cairo. Their other orders of clergy are bishops, archpriests, priests, deacons, and monks. The patriarch is named by his predecessor from among the monks of the convent of St. Anthony, or chosen from among them by lot. He is not permitted to marry. He nominates the Metropolitan of Abyssinia. See ABYSSINIA. There are twelve bishops. The C. are very strict in their religious observances, and hate other Christian sects even more than they hate the Moslems. They baptize by immersion; practise unction, exorcism, and auricular confession; and celebrate the Lord's Supper with leavened bread which has been dipped in wine. They keep Friday with great strictness as a fast-day. They have many schools, but only for boys, who learn the Psalms, Gospels, and Apostolic Epistles in Arabic, and then the Gospels and Epistles in Coptic. The Coptic, however, is not grammatically taught, and is not now a spoken language, having been everywhere supplanted by the Arabic. It has not been spoken in Lower Egypt since the 10th c., but lingered for some centuries longer in Upper Egypt. It is, however, still used by the C. in their religious services, but the lessons, after being read in Coptic, are explained in Arabic. The Coptic literature consists in great part of lives of saints and homilies, with a few Gnostic works. The alphabet was borrowed from the Greeks at the time of the introduction of Christianity, with the addition of a few letters. There are two principal dialects of the language—the Sahidic or Upper Egyptian, and the Memphitic or Lower Egyptian, which is sometimes exclusively called Coptic. A third dialect, the Bashmuric, of which only a few remains exist, was spoken in the Delta, and is interesting from its points of resemblance to the language of the hieroglyphics.

CO'PULA (Lat. band) is a term employed in Logic to designate the word which unites the two notions of a sentence—viz., the subject and predicate into one judgment or thought. Thus, in the sentence, 'Art is long,' *art* is the subject, *long* the predicate, and *is* the copula. The C. is either expressed apart by some part of the verb 'to be,' as in the above sentence, or it is contained in the word expressing the predicate—as, 'The flower blooms'—i. e., *is* blooming.

CO'PY, in the Fine Arts, is a reproduction of a work, whether painting, statue, or engraving, not by the original artist. A C. made by the master himself is called a repetition (in French, a *doublette*). It is said that copies are of three degrees: first, where the original is mechanically imitated in its minutest details (this is always done when an engraving is to be obtained); second, where only the principal traits are imitated; and, third, where the general idea merely is borrowed. A C. of a statue, or other piece of sculpture, taken from a mould, is not called a C., but a *Cast* (q. v.).

CO'PYHOLD, a species of estate or right of property in land, in Ireland and England, nearly resembling in many particulars the feu-rights of Scotland. C. is expressed technically as 'tenure by copy of court-roll, at the will of the lord, according to the custom of the manor.' This means, that it is tenure of land, being part of a manor, the title being evidenced by the court-rolls of the manor, and the right of the owner being in conformity with the immemorial customs of the manor. The addition, 'at the will of the lord,' serves only as a memorial of the derivation of this species of estate from the estates granted in old times to the bondsmen, or *Villeins* (q. v.), which were of course resumable at the pleasure of the lord. But the will of the lord is now absolutely controlled by the custom of the manor, which forms the law of the tenure; and as this custom must be immemorial, i. e., extending to the reign of Richard II., no C. can now be created.

The custom of each manor may vary in important particulars. In some, the C. lands are held for life only; in some, they descend according to particular rules of their own; in most, however, they descend according to the ordinary rules of succession. But the custom, whatever it may be, cannot be altered by the holder of the C.; he cannot, for instance, entail his land unless the custom warrants him.

An important point, also dependent entirely upon special custom, is the amount of the money-payments due by the copyholder to the lord of the manor. These are divided into the *rents*, an annual payment of the nature of the Scottish feu-duty; *fines*, payments on particular occasions, such as alienation or succession; and *heriots*, or the best piece of personal property, to which, on the death of the copyholder, the lord becomes entitled. As to fines, it may be observed, that the custom may either fix the amount, or it may leave them to be at the pleasure of the lord; but as the courts of law require that all customs, even when indefinite, shall be reasonable, they have fixed the extreme amount that can be exacted at two years' rent of the land.

One practical distinction of much importance, drawn between freehold and C. land, is the mode in which it must be conveyed. An ordinary conveyance is ineffectual in regard to C., and indeed would operate, like other attempts to break through the custom which forms the title, as a forfeiture. The course adopted is almost identical with the Scottish *resignation*. The owner comes to the steward of the manor, and by a symbolical delivery, according as the custom may prescribe, surrenders the land to the lord of the manor, in order that it may be granted again to such person, and on such terms as are desired, and as the custom authorizes. The steward, by a repetition of the symbolical delivery, transfers the C. to the person in question, in terms of the surrender; and he then pays the customary fine, and takes the oath of fealty.

This is called conveyance by surrender and admittance. In the case of an heir succeeding, there is no surrender, but there is admittance only upon payment of the customary fine, and it is enforced by a customary penalty. A mortgage is effected by a surrender, upon condition that the money is repaid, and the admittance takes place only in event of failure of payment. A C. may, in like manner, be devised by will, the devisee being admitted on the death of the devisor. A comparison between C. and the Scotch feu will be found in Paterson's *Compendium of English and Scotch Law*, p. 57.

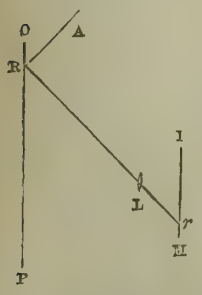
The inconveniences and loss accruing through the variety of customs to which C. lands are subject, have led the legislature to make provision for their extinction. By the copyhold commissioners, all the services due to the lord of the manor may be commuted for a fixed rent. The lord of every manor is also authorized to enfranchise, or convert into freehold, the C. lands by agreement with their owners. And after the next admittance subsequent to the 1st of July 1853, either the lord or the tenant so admitted may compel enfranchisement on payment, either of a fixed sum, where it is at the instance of the lord, or of an annual rent, where it is at the instance of the tenant, fixed in both cases by the commissioners.

COPYING, a term applied in Photography to the reproduction of paintings, engravings, manuscripts, &c. The kinds of camera and lens most suitable for the purpose, will be found described under their respective heads; the quality and condition of chemicals necessary are based upon the facts, that long exposure is almost invariably required, and that, in the majority of cases, it is desired to copy black marks upon a white ground, as in a sheet of music, for example. Where it is obvious that nothing that can be called a middle tint is required, but simply pure black and white, recourse should be had to organic matter in the bath; a little acetate of soda, and an extra amount of acetate of acid, may be also added, and an old collodion containing free iodine employed.

It is important that the work or surface to be copied should be

placed in a strong light, and exactly at right angles to the axis of the lens, which should be furnished with a *small* stop. These three conditions, it will be seen, are such as are calculated to insure density in the blacks of the negative, freedom from distortion, and sharpness at the edges of the picture. The copying of oil-paintings seems to the amateur, at first sight, to present almost insuperable difficulties, on account of the reflected light from the varnish passing through the lens, and producing black patches on the negative. This may, however, be completely avoided by the employment of a lens of long focus, which admits of the oblique pencils of light passing off without entering the camera.

This will become more intelligible by reference to the following diagram, in which OP is supposed to be an oil-painting, L the lens, and IM the image. Let A be a ray of light, incident at R; reflection at the varnished surface will cause it to pass through the lens, and come to a focus on the sensitive surface at *r*, causing an increased action at that point, resulting in a black patch. If, however, a lens of longer focus be employed, and the camera be moved further from the picture (as it must be to obtain the same sized image), as shown by the dotted line, it will be seen that no reflected rays can fall upon the sensitive plate, but that they will all pass beyond the field of view.



Attention to the laws of the reflection of light, will suggest to the reader the importance also of avoiding a bright light immediately behind the camera, as the rays of light would then fall on the varnished surface, nearly at right angles, and be reflected into the camera. The oil-painting, therefore, though placed in strong sunshine, for the purpose of giving vigor to the more obscure parts, should be so arranged as to allow the light to fall on it at an angle of about 35° or 40°.

In copying transparent negatives, a somewhat different arrangement is required, as will appear from considering the following facts. Every object to be copied may be regarded, for the sake of illustration, as an assemblage of bright points, from each of which divergent pencils of rays are reflected, and suffer refraction on passing through the lens; an engraving or oil-painting is, in fact, in its relation to the sensitive surface, the *source of light*. In a negative, however, many of the parts of which are transparent glass, it is manifest the case is different, for if we suppose the sun or a luminous background to be placed behind the negative, *that* will act as the source of light, and any rays coming therefrom will pass almost directly through those parts of the negative which are bare glass, to the lens; thus producing the same effect as if the transparent parts were opaque, but luminous, and emitted divergent pencils of light. It is necessary, therefore, that the rays should be made to intersect at those points where bare glass exists, and this may be accomplished by employing what is called a condensing lens, by which means negatives may be most successfully copied, by placing an artificial light behind it, or still better, by reflected sunshine through it.

Negatives are sometimes copied on glass by direct superposition in the ordinary pressure-frame, such as is used for printing photographs on paper, in which case, dry plates are used, prepared either by the albumen or collodio-albumen process; and the latent image so obtained yields a transparent positive when developed by gallic or pyro-gallic acid.

COPYING-MACHINES. The various contrivances for procuring duplicates of writings without the labor of transcribing them, may be reduced to two classes. In the one, the writing is first made, and then copied; in the other, the copy and the original are produced at the same time. The essence of the first method is this:—In writing the original, an ink is used that is made for the purpose, or common ink thickened by the addition of a little sugar. When the writing is dry, a damp sheet of thin unsized paper is laid upon it, and over this a piece of oiled paper. The whole is then subjected to pressure, and the damped paper is found to have taken off an impression of the writing. It is of course the reverse of the original, but the nature of the paper allows it to be read right on the other side. The machines for communicating the pressure are of various kinds. Some pass the sheets between rollers like the copper-plate press; others act on the principle of the common printing-press. A simple plan is to wrap the sheets round a wooden roller of about an inch diameter, lay this upon a table, and roll it under a flat board, pressing all the while. Another very common method of copying, is by means of prepared blackened paper laid between two sheets of thin writing-paper. The writing is traced firmly on the upper sheet, with a steel or agate point, or common black-lead pencil, and the lines are found transferred in black from the blackened sheet to the paper adjacent. By having several of these blackened leaves, a number of copies may be produced at once. The blackened paper is prepared by saturating it with a mixture of lard and lampblack, and cleaning it so far that it will not soil paper unless pressed against it.

CO'PYRIGHT, an author's exclusive right of property in any work which he writes, and which, under certain limitations, is transferable to his heirs and assigns. Such is the chief or general meaning of the term, which now, however, embraces several varieties of right; and these, from the importance of the subject, we propose to consider separately.

Books.—The idea of a right of property in literary composition is of modern origin. Nothing is heard of C. previous to the invention of printing, nor for a long time afterwards. In ancient and mediæval times, books appear to have been transcribed freely by other parties than their authors, and as freely disposed of, often at great prices. After the introduction of printing, the liberty to publish books became the subject of licenses and patents; and these privileges may be said to have constituted a special monopoly of the nature of copyright. In the absence of any license or protection of this kind, authors could only resort to the common law to vindicate their real or fancied rights. But the common law of England was silent on the subject. There were serious differences of opinion among lawyers as to the availableness of an exclusive right in literary composition, viewing it as a chattel or thing that could be held, inherited, or assigned.

How, it was asked, could ideas, or the way of writing a narrative, be made property? Supposing, however, that a certain structure of ideas and written words could be invested with the quality of property, it was reasonable to conclude that the property should be absolute and perpetual to the owner, his heirs and successors. Such being the case, it would be proper for the heirs of Shakspeare, Milton, Bunyan, and other literary luminaries of past times, to claim possession of the works of their respective ancestors; leaving them, of course, the right either to maintain a monopoly, or to suppress the works altogether. Such were the questions that puzzled the English jurists of the early part of the 18th c. A compromise appears to have been made. No decision was come to, as to whether literary composition was property in the ordinary sense of the word. Yet, looking at it as a thing on which thought and labor had been expended, and professedly 'for the encouragement of learning,' it was deemed worthy of legal protection for at least a period limited by considerations of public policy. An act of parliament was accordingly passed on the subject in 1709.*

This, the first C. act, 8 Anne, c. 19, sets out as follows: 'Whereas printers, booksellers, and other persons have of late frequently taken the liberty of printing, reprinting, and publishing, or causing to be printed, reprinted, and published, books and other writings, without the consent of the authors or proprietors of such books and writings, to their very great detriment, and too often to the ruin of them and their families: for preventing, therefore, such practices for the future, and for the encouragement of learned men to compose and write useful books, may it,' &c. The chief provisions of the act were, (1.) That authors who, after April 10, 1710, had not sold their C. of works in print, were to have the sole right of printing them for 21 years; (2.) Authors of books not printed and published, and their assignee or assigns, to have the sole liberty of printing and reprinting such book and books for the term of 14 years, to commence from the day of the first publishing the same; (3.) After the expiration of the said term of 14 years, the sole right of printing or disposing of copies to return to the authors, if they were then living, for another term of 14 years.

Under this act, authors disposed of the C. of their works for the specified period, at the end of which, 28 years at the most, the C. lapsed. Although the works might then have been considered public property, a custom arose among publishers of not interfering with each other's lapsed copyrights; and in a sense each assumed a kind of perpetual monopoly of the works which he had purchased for a terminable period. So stood matters, when Alexander Donaldson, an Edinburgh bookseller, of whom some notice has been taken in the article BOOK-TRADE, broke through the conventional regulations, by issuing cheap reprints of works out of copyright. There ensued a litigation, of which it is necessary to present some details. At divers times in 1729, James Thomson sold the C. of his *Seasons* and other poems to Andrew Millar, a London bookseller, for sums amounting to £242, 10*s*. Thomson

* Until this act came into operation, the law of Scotland, as regards copyright, had been as defective as that of England. Under date November 9, 1699, the following occurs in the *Domestic Annals of Scotland*, by R. Chambers, vol. iii.: 'It was customary for the Lords of Privy Council to grant exclusive right to print and vend books for certain terms—being all that then existed as equivalent to our modern idea of copyright. Most generally, this right was given to booksellers and printers, and bore reference rather to the mercantile venture involved in the expense of producing the book, than to any idea of a reward for authorcraft. Quite in conformity with this old view of literary rights, the Council now conferred on George Mossman, stationer in Edinburgh, "warrant to print and sell the works of the learned Mr. George Buchanan, in ane volume in folio, or by parts in lesser volumes," and discharged "all others to print, import, or sell, the whole or any part of the said Mr. George his works in any volume or character, for the space of nineteen years."' Some other instances of the same kind are given, making it clear that in these times books could not be printed in Scotland without authority from the Privy Council.

died in 1748. According to the Act 8 Anne, c. 19, the utmost length to which the C. of these works could be extended was 28 years, which terminated in 1757. Millar died in 1768, and his executors, in 1769, sold by auction the C. of the works in question for £505. The purchasers were 'Beckett and others.' This sale was, in reality, an imposition; for, as just mentioned, the C. had expired in 1757. Aware of this fact, Donaldson, in 1768, issued a cheap edition of Thomson's *Seasons*. He was now challenged for an invasion of C.; and in 1771, Beckett and others applied for, and procured, an injunction from the Court of Chancery to restrain him from further printing and selling the work, and to make him answerable for the profits he had already realized. The only explanation of this extraordinary proceeding is, that the applicants for the injunction imagined that at common law they had acquired a property in Thomson's *Seasons* in all time coming. The question at issue was nothing less than the creation of perpetual monopolies in literature—not for the benefit of authors and their families, but for certain publishers and their assigns. The notion of a common-law right had prevailed in granting the injunction, and the validity of such a notion was now for ever to be determined. Donaldson appealed to the House of Lords. The chief points pressed for consideration were, whether at common law an author had the sole right of printing his works, and whether, possessing a right of that kind, it was taken away by the statute 8 Anne, c. 19. The Lords differed in opinion, but the decision finally come to was, that any right at common law was impeached and taken away by the statute; and the decree of the Court of Chancery was accordingly reversed. See Brown's *Parliamentary Cases*, vol. ii., p. 136. By this famed decision, it was settled that claims of C. rest altogether on the statute and its interpretations. Ever since, any one is at liberty to print and sell works of which the statutory term of C. has expired; on the simple ground, that all such works are public property.

The C. law did not extend to Ireland till after the union with that country, when (1801) the whole United Kingdom was included by the Act 41 Geo. III. c. 107. Previous to this time, many of the most saleable of the British C. works were freely reprinted in Dublin, and occasionally found their way across the channel to the annoyance of English authors and publishers. The next act concerning copyrights was that of 54 Geo. III. c. 156 in 1814, by which the period of C., instead of being 14 years, and contingently for 14 years more, was fixed to be 28 years certain, and for the residue of an author's life, if he were living at the end of 28 years.

The impetus given to literature during the early part of the present century, by the popular and voluminous writings of Scott, Byron, Moore, Wordsworth, and others, along with the growing taste for reading among the middle and less affluent classes, greatly increased the market value of C. in every species of literary production. As a natural consequence, that kind of disinterestedness so strikingly demonstrated in Robert Burns, who could hardly be prevailed on to accept a few pounds complimentarily in requital for hundreds of the most beautiful lyrics was no longer seen; on the contrary, it became a recognized principle that an author was entitled to regard the product of his brain as purely a mercantile commodity. At length, under an impulse communicated by the assigns of some valuable copyrights about to expire, and on the assumption of benefiting the families of certain popular writers, the legislature was induced to extend the term of copyright.

By the Act 5 and 6 Vict. c. 45, called Talfourd's or Lord Mahon's act, 1st July, 1842, the term of C. was extended as follows: 'And be it enacted that the copyright in every book which shall after the passing of this act be published in the lifetime of its author shall endure for the natural life of such author, and for the further term of seven years, commencing at the time of his death, and shall be the property of such author and his assigns: provided always, that if the said term of seven years shall expire before the end of 42 years from the first publication of such book, the copyright shall in that case endure for such period of 42 years; and that the copyright in every book which shall be published after the death of its author shall endure for the term of 42 years from the first publication thereof, and shall be the property of the proprietor of the author's manuscript from which such books shall be first published, and his assigns.' In the case of subsisting copyrights, the term was to be extended to 42 years, except when they belonged to an assignee for other consideration than natural love and affection; in which case they were to cease at the expiration of the 28 years, unless their extension were agreed to between the proprietor and author.

In this act, there is a remarkable clause giving power to the Judicial Committee of the Privy Council to license the publication of books of importance, which the proprietor refuses to republish after the death of the author. Formerly, there was an obligation on publishers to deliver 11 copies of new works to certain universities and other public institutions; the obligation was now modified to 5 copies. The importation of English C. works printed in foreign countries is prohibited. C. is declared to be personal property, and may be bequeathed as such; in case of intestacy, it is to be subject to the same law of distribution as other personal or movable estate. The old obligation to register the C. of new works at Stationers' Hall was also modified; registration is no longer obligatory, but the practice of registering is still requisite for the sake of evidence in making good claims of copyright. Forms of registration and assignment are given by the act, but the use of them is not indispensable. The law of C. makes no distinction between British subjects and aliens. A foreigner may own the C. of a work printed first in Great Britain; thus an American author may secure the copyright of his book in Great Britain by first publication there. A British author cannot receive the same benefit in return, unless some portion of his work be written on American soil. Attempts are sometimes made, by issuing editions of a work simultaneously in the United States and England on the same day, to secure both British and American copyrights.

The ordinary process of stopping the issue of unauthorized reprints of C. works, which receive the name of pirated editions, consists, in the first place, in procuring an injunction from the Court of Chancery (if in Scotland, an interdict from the Court of Session), and of afterwards raising an action of damages at common law. On all that concerns prosecution, as well as for many details respecting C. in its different varieties, we refer to Godson and Burke's *Treatise on the Law of Copyright*.

Such is the history and general nature of the law of C. respecting books. The last-mentioned act, more explicit than previous statutes, remains the great charter on the subject. Unfortunately, it still leaves some defects which it would require a fresh law to remedy. The extension of C. for the assumed benefit of authors and their families, which is the leading feature of the act, must be pronounced generally worthless. In the great majority of cases, authors assign the C. of their manuscripts for a consideration to publishers, who, looking for remuneration within a reasonable length of time, cannot, and as a rule do not, give a higher price for a 42 than for a 28 years' copyright. The tendency of Talfourd's act is still more than ever to lock up copyrights in the hands of the original assigns, where they are apt to become torpid and useless.

A remedy for this evil has lately been found in a practice followed by certain acute and enterprising publishers of cheap reprints. Buying up the unexpired copyrights of books which have gone somewhat out of notice, they issue them in a form suitable to the nature of their business; and such reanimated productions constitute no small share of the cheap volumes that invite public attention—the author and his heirs being not in the slightest degree benefited by the process of literary resurrection.

Extracts, Abridgments, &c.—C. in a book entitles the proprietor to prevent extracts being made from it; but in practice, short extracts for the purpose of criticism, as in reviews, or for historical illustration, are tolerated. Unauthorized abridgments of C. works are deemed piracies, and their sale can be stopped. In such cases, however, the abridgment must show a clear adoption of the language or collocation of the words of the original. It is now determined that no C. can be maintained in mere subject, information, or ideas. A writer may have put himself to great trouble to procure information on a particular subject; but the law does not recognize how information is procured. If a second writer use the information of the first (though that may have little regard to matters of fact), and make out of it a new work, there is no invasion of C. unless the words of the first have been at the same time taken. See Preface to Napier's *Memoirs of Dundee*.

Encyclopædias, Periodicals, &c.—The C. of articles contributed for and included in encyclopædias, magazines, reviews, or other periodical works, and of books published in a series, was regulated by the Act 5 and 6 Vict. c. 45. The C. of such articles, being paid for and assigned, belongs to the publisher, but he cannot publish them separately without the consent of the author. The author, however, may reserve the right of separate publication, and merely sell the right to use the article; but, should he republish any such article or articles, it may only be done in such a manner as not to prejudice the right of the original publisher.

Dramatic Pieces and Musical Compositions.—These with right of representation and performance are, by the Act 5 and 6 Vict. c. 45, subject to the same C. as books. Strictly, a C. song cannot be publicly sung, or a tune publicly played, without the permission of the composer or his assigns. Since 1882 the author must print on the title-page that he reserves the right of performance. Verses must not be taken from a periodical or copyright work, and set to music, for sale, without permission. A C. work of fiction may be dramatized without permission.

Lectures and Public Addresses remain the C. of the person delivering them. By 5 and 6 William IV. c. 65, printers and publishers are liable to a penalty for printing and issuing spoken addresses without the consent of the author. It is understood that no one is at liberty to take down a sermon as delivered by a clergyman, and pub-

lish it without permission; the act, however (§ 5), makes some exceptions: protection is not extended 'to any lecture or lectures delivered in any university, or public school, or college, or in any public foundation, or by any individual in virtue of, or according to, any gift, endowment, or foundation.' Under this permissive clause, it would appear that sermons delivered by clergymen of the Established churches, in endowed places of public worship, are deemed public property.

Letters, and every kind of epistolary correspondence, are the property of the writer. The receiver of a letter may retain it for his own use, but, strictly, he cannot publish it without the permission of the sender or his heirs, neither can he sell it as a curiosity. The sale of letters of distinguished individuals is illegal, though ordinarily tolerated. See *Curtis* on the law of C. As to Scotland, see the case of the *Scotch Thistle* newspaper, in Irvine's report of the trial of Madeleine Smith.

Newspaper matter, when the newspaper in which it appears is registered under the Copyright Act only, is subject to the common law of C., but practically, and for mutual convenience, the intelligence in one paper is freely copied by the more respectable class of papers with, and in the less respectable without, acknowledgment. The taking of leading articles in the same manner might doubtless be checked; as would also be the unauthorized adoption of existing newspaper titles.

Engravings, Maps, Charts.—C. in these is secured by several acts, more particularly the 17 Geo. III. c. 57. The term of C. is 28 years. Each engraving or map must have on it the date of publication and name of publisher. Those who infringe C., forfeit the plates on which the pirated engravings or maps were printed; they forfeit also every pirated sheet, and five shillings for every print undisposed of. There is no C. in subject. Any one may invent or delineate and sell pictures from subjects in C. books, without challenge. It is understood that in painting a portrait, C. remains with the artist, although he be paid for the picture, and the purchaser cannot take copies without permission or assignment. C. as to paintings, however, is ill defined and defective, and an improved law on the subject is said to be under consideration. See DESIGN, under which head is also noticed the C. of models, sculptures, casts, patterns of carpets and paperhangings, &c.

Copyright in the Colonies.—By the Act 5 and 6 Vict. c. 45, the C. of books, &c., printed in the United Kingdom, is extended to all British colonies; and the Act 8 and 9 Vict. c. 93, concerning the trade of the colonies, absolutely prohibited these dependencies from importing pirated editions of C. works. Practically, this last recited act was unavailing. Large quantities of cheap reprints of British C. books continued to be imported from the United States into the British American possessions. Remonstrances against these irregularities at length led to some special legislation. It was ordained by the Act 10 and 11 Vict. c. 95, that the colonies might respectively enact a law to enable them to import pirated C. works on the plan of exacting a custom-house duty on such works, the proceeds to be handed to the proprietors of the said copyrights. Colonial laws were accordingly enacted, in nearly all the British Colonies except Australia. But the provisions were found quite inadequate. In 1874 the Dominion of Canada passed an act, confirmed by the Imperial Parliament in 1875 (c. 53), for securing in Canada the rights of authors, and for prohibiting the importation into Canada of any work for which copyright under the colonial act had been secured. By this act, if there is copyright in the United Kingdom in a book, the author becomes entitled to copyright also in Canada, and none but the owner can import into the United Kingdom any copies reprinted in Canada. A copyright for 28 years from the recording thereof is now secured in Canada to authors; and if the author, or his wife or child, is living at the end thereof, then, for 14 years longer, such copyright being recorded there with the Minister of Agriculture.

Copyright in the United States is well defined. The latest act of Congress on the subject is that of the year 1870. C. can be secured by any citizen of the United States or resident therein, who is the author of any book, map, chart, dramatic or musical composition, engraving, cut, print, photograph, painting, statue, &c. The term of C. is 28 years from date of recording; but at the end of that term the author if living, or, if dead, his widow or child, may record C. for an additional term of 14 years. In cases of renewal, record to be published in one or more newspapers. The first step in securing C. is to send a copy of the title of book or other article, or a description of the painting, statue, &c. to the librarian of congress before publication, and two copies of the book (a photograph in the case of paintings, &c.) must be sent to the librarian within ten days after publication. The librarian makes the proper record, receiving a small fee. It is requisite that notice of entry of C. be stated in each book or on each other article. All pirated copies of C. works are to be forfeited, independently of claims for damages by action at law.
